Safety information

Repair work

1. General precautions

This workshop manual was created for qualified individuals with specialized technological knowledge regarding vehicle maintenance and should not be used by anyone other than such individuals.

Carefully read the workshop manual before starting work and verify that the correct work procedures and tools are used.

Workshop manuals contain information labeled as "Warning", "Caution", and "Supplement" that is pertinent to the safety of service technicians and vehicle safety that must be read and followed closely.

2. Precautions for before work is started

Prepare the necessary tools, measuring devices, and special tools.

Prepare the parts to be replaced and parts whose reuse is prohibited. Always replace parts with genuine parts.

Service technicians must wear a clean service technician uniform, hat, and safety shoes.

Use covers to prevent damage to the vehicle and seats.

When jacking up the vehicle, place chock blocks at the wheels and use a stand after jacking up to support the vehicle. Use the appropriate safety devices when lifting up the vehicle using a lift.

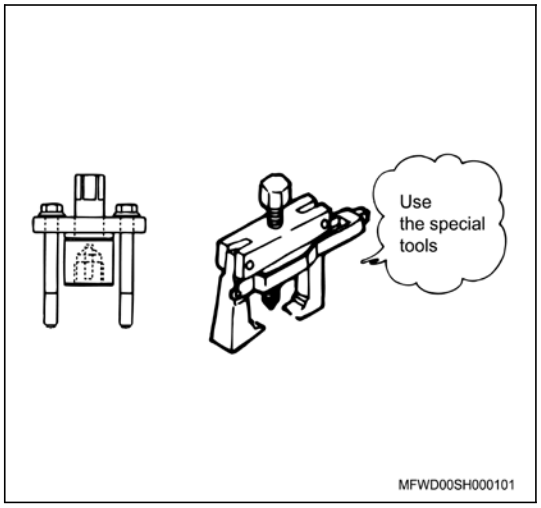
Disconnect the battery negative terminal before start to work

3. Precautions during work

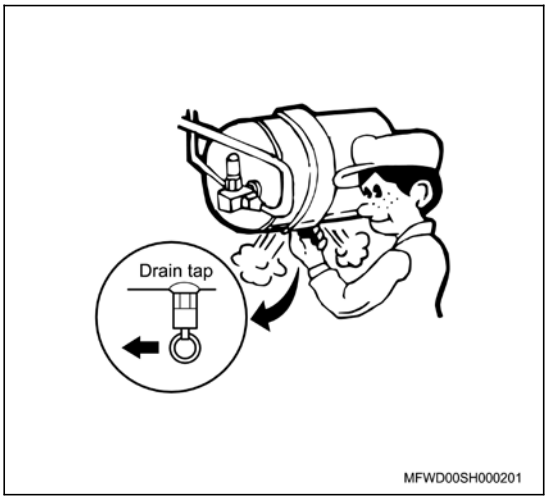
Always remember to perform operations in a safe manner. Perform operations that require 2 or more people in a safe manner.

Do not leave the engine running for an extended period of time or perform painting in a poorly ventilated working environment.

Make sure to use the special tools if the procedure requires them for the work.



Remove the pipes and air hoses only after bleeding air from the air tank.

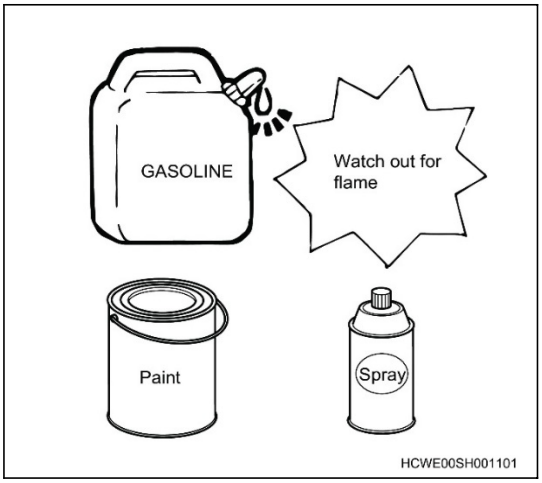


Do not use tools such as wrenches that have lost their edge, hammers with frayed edges, or chipped chisels.

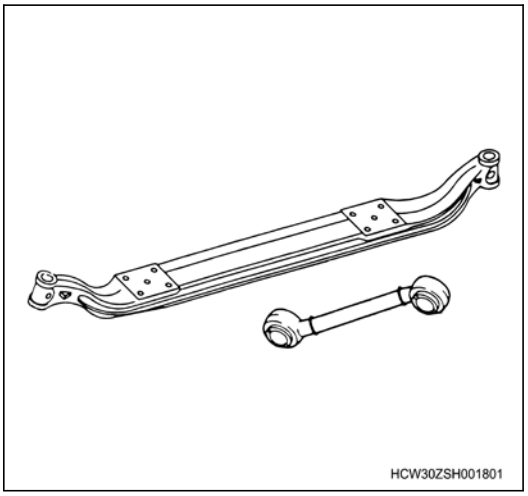
Use of machines such as grinders, cranes, or welding equipment should be performed by a qualified individual

Qualified technician work
When handling volatile materials, take care that they do not catch fire

Handling volatile oil



Because parts for heavy-duty vehicles are extremely heavy, perform work operations by fastening these parts using the appropriate jacks or wires



Quickly wipe away any oil that has adhered to rubber parts to prevent deterioration.

Properly organize any removed parts and prevent any parts whose reuse is prohibited from becoming mixed in.

When reinstalling removed parts, clean the parts as necessary. When applying liquid packing, etc., always remove any oils that may have adhered to the application areas.

4. Precautions during welding operations

Before starting welding operations, disconnect the battery negative cable, and disconnect all control units from their harnesses.

Turn all switches OFF.

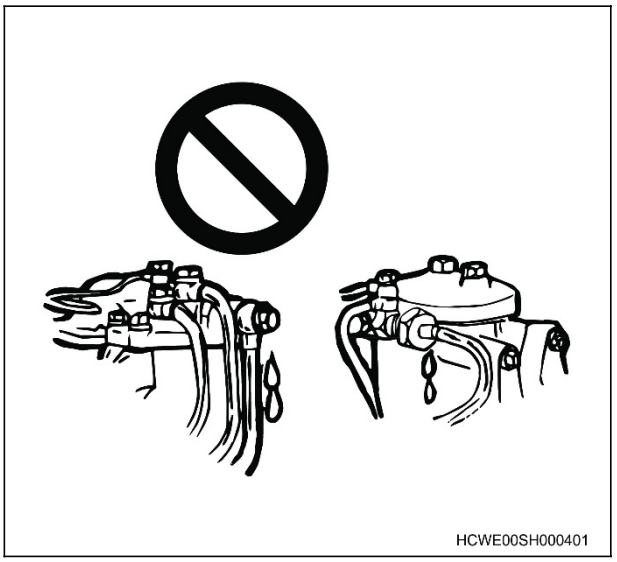
Install the ground connection for the welder as close to the welding area as possible.

5. Precautions for after work is completed

Perform a final check to verify that the problem has been solved.

Post Work Checks

Check to ensure that there is no leakage of fuel, oil, or coolant.



1. Replacement parts and parts number

Replace removed packing, oil seals, O-rings, crimping lock nuts, bending lock nuts, split pins, etc., with new parts.

Make sure to check the supply system and part numbers in the parts catalog as part numbers indicated in this manual may differ from the supply system and are subject to change.

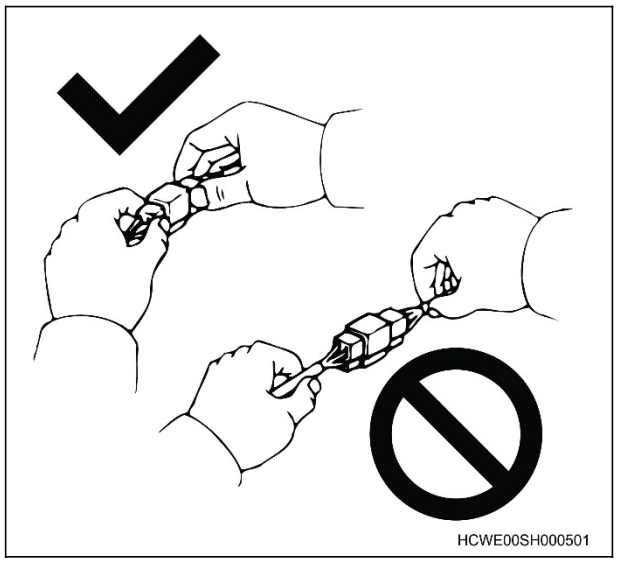
2. Connector Handling

Always check the type of lock connectors being used as there are two types: a type that opens by lifting the release area, and a type that opens by pressing the release area.

When removing the waterproof connector, remove dust or moisture that adheres to the connector by blowing with air, etc.
If dust or moisture enters the connector, remove it before connecting the connector. As for moisture, dry well to prevent rust.

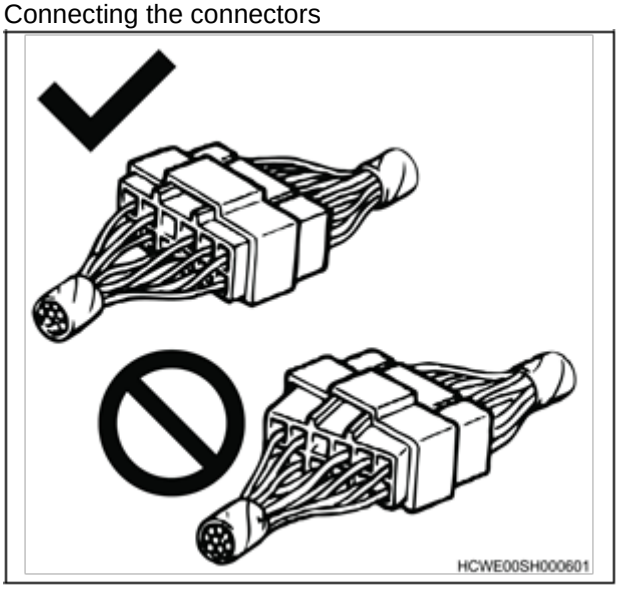
When disconnecting connectors, do not pull on the harnesses as doing so may result in open circuits caused by wires becoming loose.

Handling the connectors



When connecting connectors, securely press in until a clicking sound can be heard

Connecting the connectors



If connectors of the same shape are used for different parts located in close proximity of one another, proper identification of connection locations can be made possible by applying tape of different colors and in different patterns to differentiate the harnesses. When reconnecting connectors, check to ensure that harness corrections are correct.

Electrical parts handling

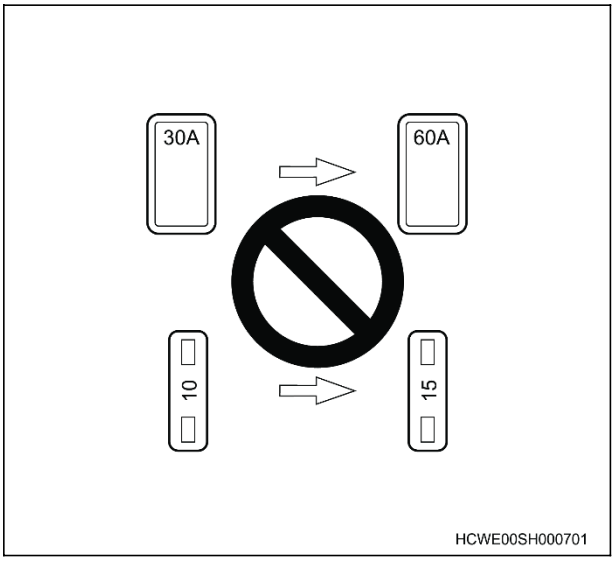
If the fuse blows out, make sure to replace it with a non- defective fuse of the specified capacity after identifying the cause of the blowout.

Using a fuse with a capacity other than specified, wires, aluminum foil, etc., causes a failure or vehicle fire.

Do not replace or inspect fuses if the ignition switch is in "ON" position or while running the vehicle. Doing so may result in an unexpected accident or failure.

When replacing a fuse, install by pushing it in securely to prevent loose connections.

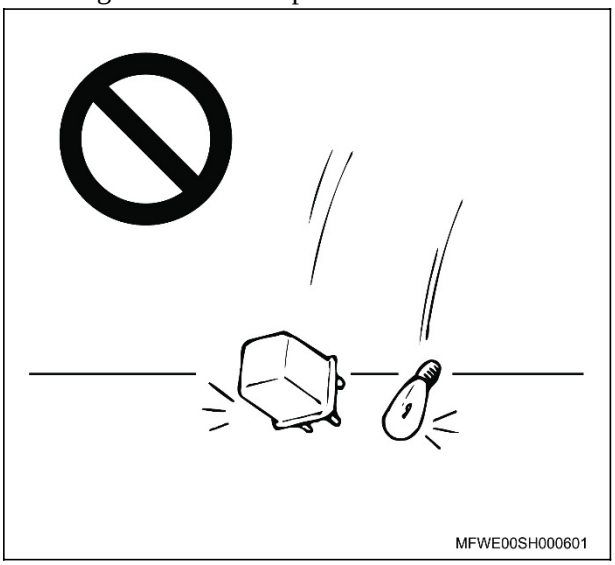
Handling the fuse



When washing the vehicle, cover electronic components with plastic and do not directly apply high-pressured water

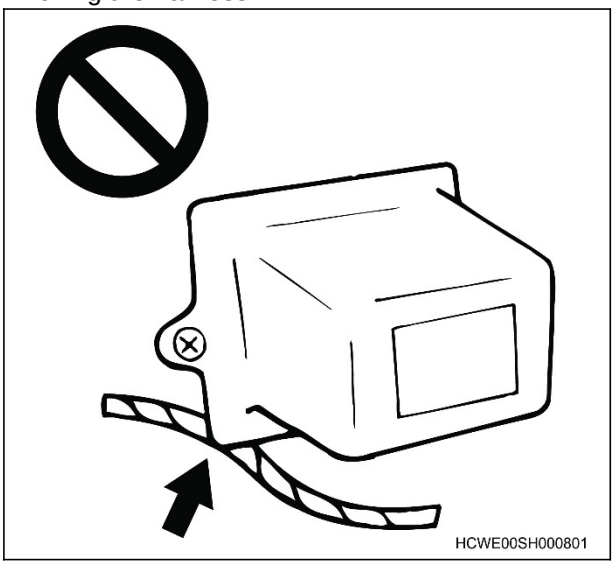
Do not drop or throw electronic components
Handle electronic components with sufficient care, and do not damage the parts by dropping or throwing them

Handling electronic components



When installing electronic components, take care to prevent harness pinching and do not forcibly push components into place

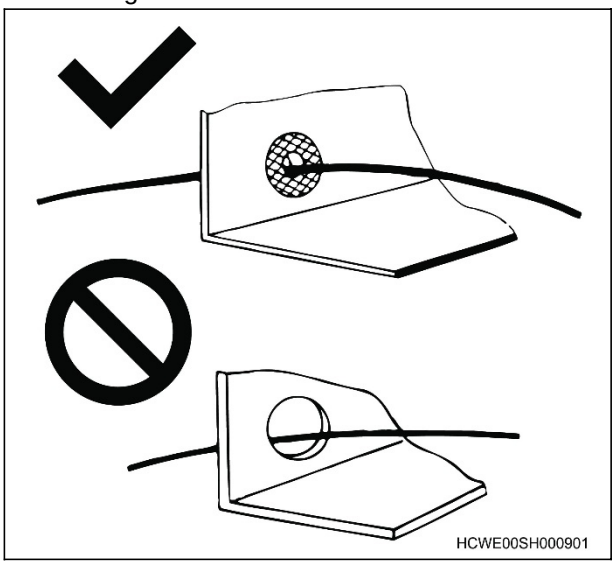
Pinching the harness



When disconnecting harnesses, clean the connectors and ensure the connections are secure.

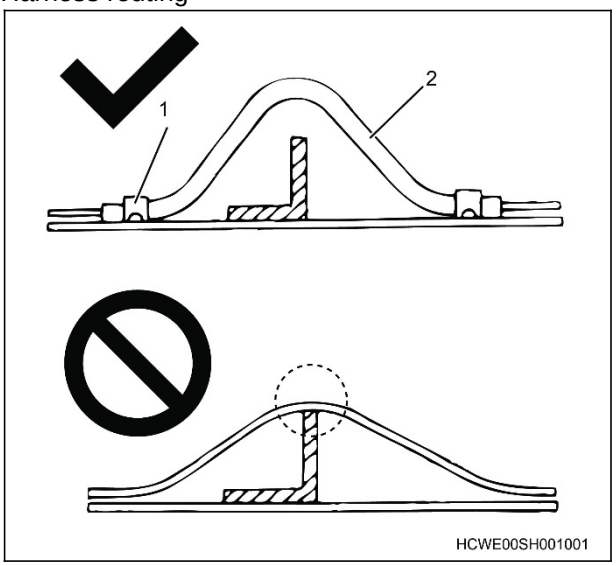
Use grommets or tubes to prevent damage to harnesses that may come in contact with the sharp edges or surfaces of other parts.

Protecting the harness



When wiring a harness by diverting it around other parts, give the harness a sufficient amount of free length, and use a protective tube and clip to ensure it does not come into contact with surrounding parts.

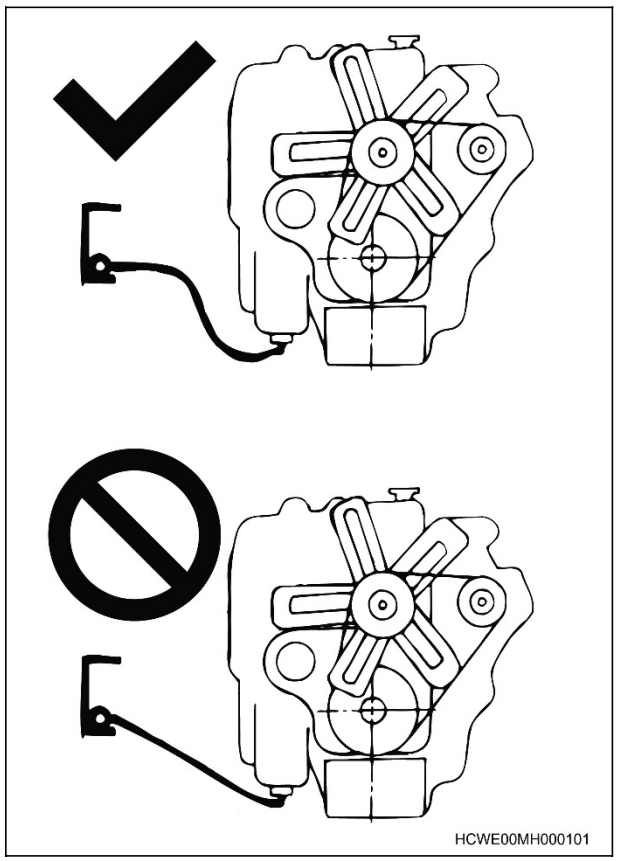
Harness routing



1. Clip
2. Protective tube

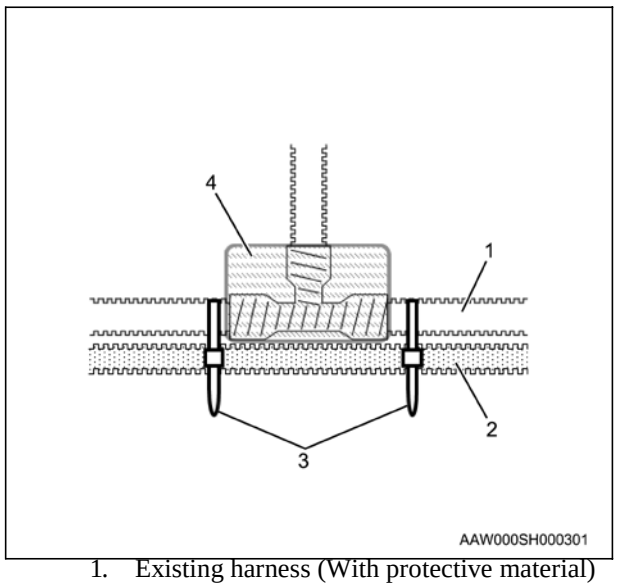
For wiring between the engine and chassis, give the wiring sufficient free length to prevent wear and damage caused by vibration.

Engine and Transmission Wiring



When securing additional wires along existing harnesses, install band clips on the protective materials (corrugated tubes, vinyl chloride tubes, rigid tubes, protectors, etc.) installed on the existing harnesses.

Repairing the harness



1. Existing harness (With protective material)
2. Additional harnesses
3. Band clip for securing harnesses
4. Area where securing with band clips is prohibited

Commercial electronic products

When inspecting or repairing vehicles equipped with aftermarket electronic components such as lights, audio systems, or radios, start work after turning OFF or removing all such parts.

Failure by electrostatic discharge

Because high voltage applied to electronic components due to electrostatic discharge may result in malfunctions, touch a known good ground before inspecting or replacing related parts.

Do not directly touch the connector pins of electronic components or rub them with other parts or covers, etc.

If replacing electronic components, connect the parts to a known good ground while still in their packaged state and then remove them while taking care to prevent the connector pins from coming into contact with the packaging

Contents included in service information

Removal
Includes the removal procedure when repairing parts, devices, etc.

Installation
Includes the installation procedure when repairing parts, devices, etc.

Disassembly
Includes the disassembly procedure when overhauling a unit, assembly part, etc.

Assembly
Includes the assembly procedure when overhauling a unit, assembly part, etc.

Inspection
Includes inspection items for parts requiring inspection to ensure continued performance of parts, devices, etc.
Values are listed for parts whose standard values, setting values, and use conditions have been determined.

Cleaning
Includes the cleaning procedure for parts, devices, etc.

Preparation
Includes the preparatory procedure necessary before removing parts, devices, etc.

Adjustment
Includes the adjustment procedure if adjustment to the setting values or standard values is necessary when performing assembly or installation.

Measurement
Includes the measurement procedure for determining if the installation position of parts is correct, etc.

Drain
Includes the draining procedure for oil, etc.

Refill
Includes the refilling procedure for oil, etc.

Air bleeding
Includes the air bleeding procedure when air bleeding is necessary after changing oil, etc.

Writing
Includes the writing procedure necessary when replacing the ECM or supply pump.

Precaution
Includes the maintenance precautions specific to each item.

Disconnection
Includes the disconnection procedures for wiring, piping, etc.

Connection
Includes the connection procedures for wiring, piping, etc.

Setting
Includes the setting procedure necessary when replacing the ECM, etc.

Replacement
Includes the procedure for replacing parts, changing oil, etc.

Prioritized DTC
Includes DTCs which should be prioritized for each DTC code.

Diagnosis
Includes the diagnostic procedure for troubleshooting symptoms.
DTCs are listed in order of priority.

Repair verification
Includes the procedure for verifying resolution of the symptom by using numerical values, etc., other than the verification that DTCs are cleared.

Functional description
Includes the detailed functional description related to the functional inspection.

Symptom description
Includes the detailed symptom descriptions related to a diagnosis by symptom.

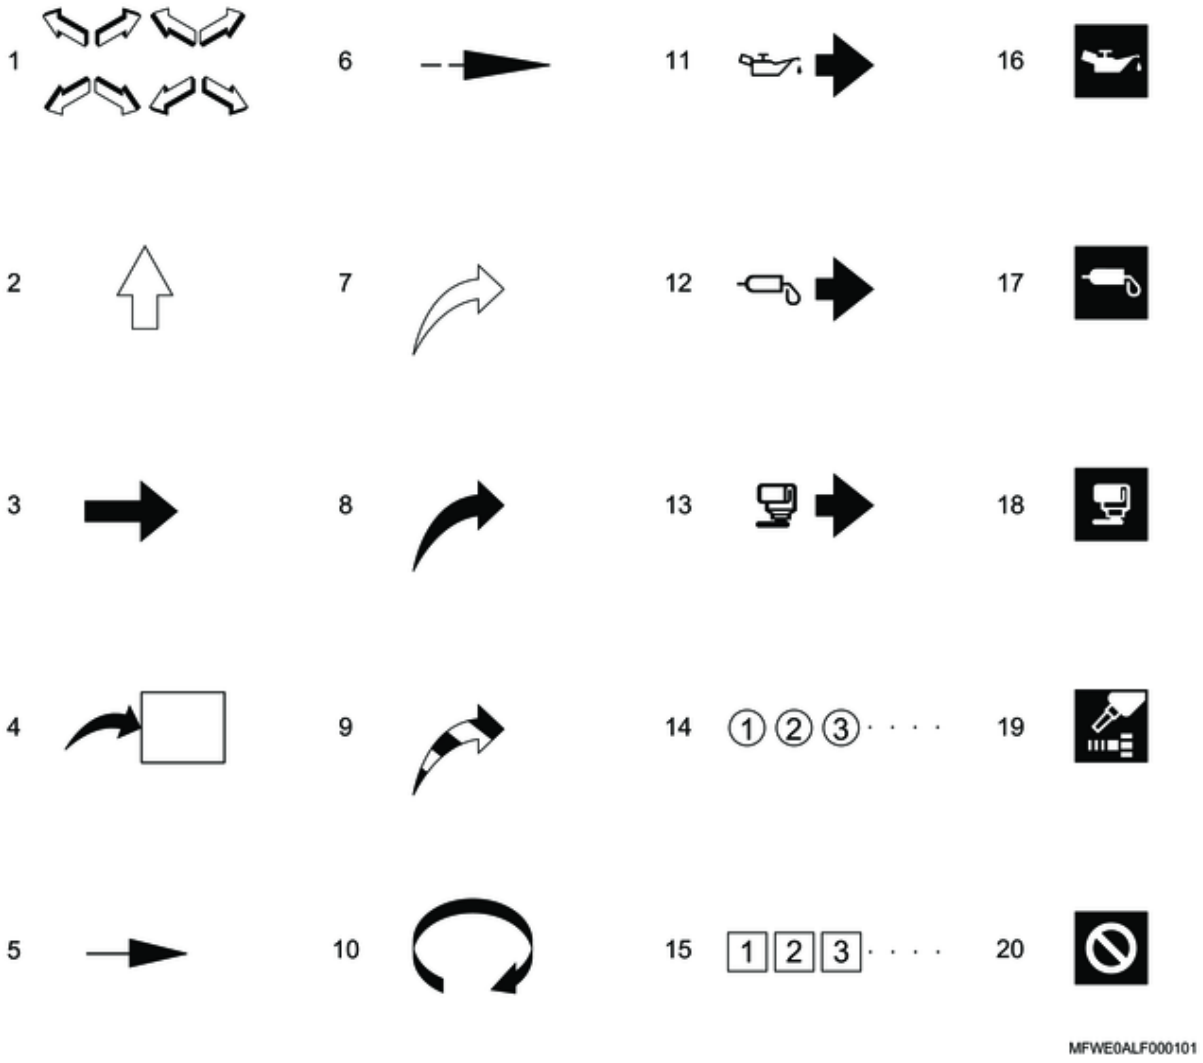
DTC description
Includes the circuit description related to DTCs.

Condition for setting
Includes information related to conditions for setting DTCs.

Action taken when set
Includes the information related to the control actions taken by the ECU, etc., when DTCs are set.

Items related to ETM
Items related to the ETM are described in the instructions on how to view the wiring diagram.

Symbols



1. Vehicle front
2. Upward
3. Operating section or operating direction
4. Detail of a particular part
5. Arrow indicating a dimension
6. Arrow indicating a cross-section
7. Outside air or cold air
8. Gas or warm air
9. Mixing of outside air and gas or mixing of cold air and warm air
10. Rotational direction
11. Apply oil
12. Apply grease
13. Apply liquid gasket
14. Working sequence (Tightening procedure, etc.)
15. Tightening torque (Component diagram)
16. Apply oil / Apply fuel (Component diagram)
17. Apply grease (Component diagram)
18. Apply liquid gasket (Component diagram)
19. Apply thread-locking adhesive (Component diagram)
20. Do not reuse (Component diagram)

Preliminary and post procedures

Preliminary procedures

1) Disconnect the battery cable from the battery negative terminal.

Caution

- **For models without urea SCR system, do not disconnect the battery cable within 1 minute after turning OFF the ignition switch.**
- **For models with urea SCR system, do not disconnect the battery cable within 3 minutes after turning OFF the ignition switch.**
- **The ECM may malfunction if the battery cable is disconnected within the predetermined time.**

2) Raise the vehicle.

Post procedures

1) Lower the cab.

2) Lower the vehicle.

3) Connect the battery cable to the battery negative terminal.

Descriptions in Wiring Diagram

1. Wiring Information

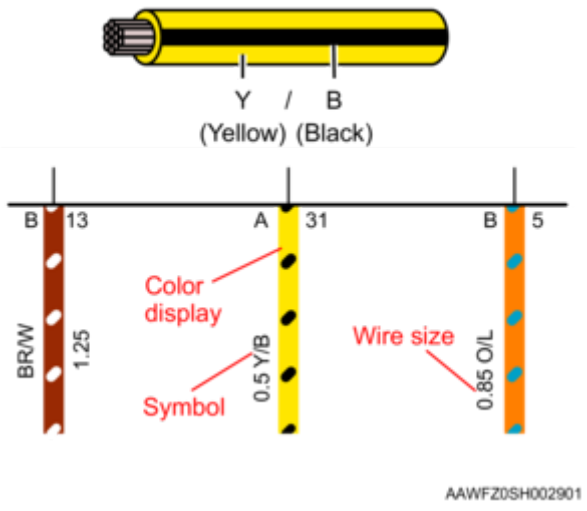
Wiring color and wire size are indicated.

The wiring colors are shown using color indications and color symbols.

The wire sizes are indicated using harness nominal sizes.

Color symbol	Color	Color symbol	Color
B	Black	**LG**	Light green
W	White	**GY**	Gray
R	Red	**P**	Pink
G	Green	**SB**	Sky blue
Y	Yellow	**V**	Violet
L	Blue	**T**	Tan
O	Orange	**BE**	Beige
BR	Brown		

Example:
If 2 colors such as Y/B are shown, it means wiring with a black line on a yellow base.

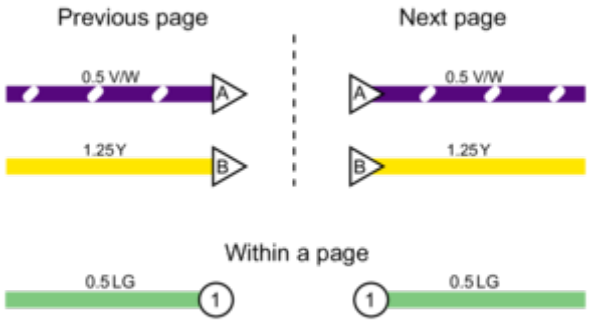


Harness Wire Size Table		
Nominal size	**Cross-sectional area (mm2)**	**Outer diameter (mm)**
0.3	0.372	1.8
0.5	0.563	2.0
0.85	0.885	2.2
1.25	1.287	2.5
2	2.091	2.9
3	3.296	3.6
5	5.227	4.4
8	7.952	5.5
15	13.36	7.0
20	20.61	8.2

Harness Wire Size Table (ISO)		
Nominal size	**Cross-sectional area (mm2)**	**Outer diameter (mm)**
0.13	0.1407	0.85
0.35	0.3436	1.1
0.5	0.4948	1.25
0.75	0.7266	1.4
1.25	1.247	1.8

2. Wiring connection symbol

Shows that the wiring with the same symbol is connected.

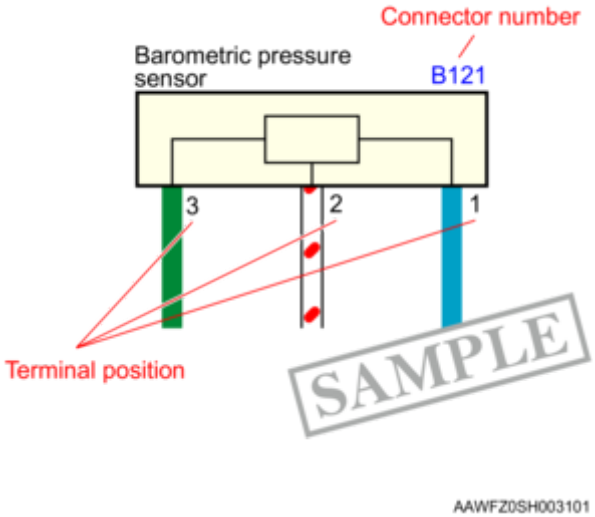


AAWFZ0SH003001

3. Connector

(a) Connector number

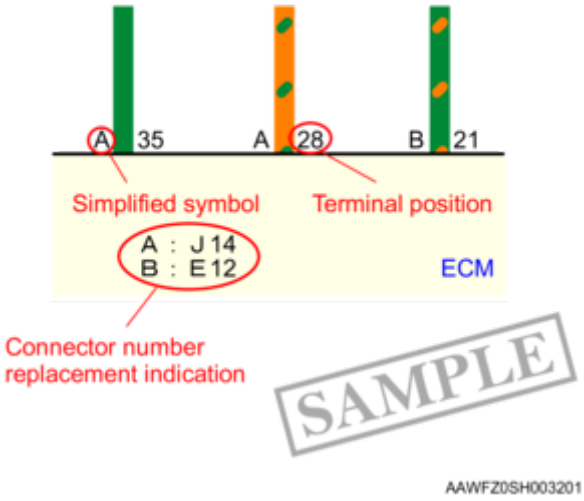
When multiple wires connected to equipment (a component) exist within the same connector, the connector number is indicated either inside or outside the equipment, and the corresponding terminal position is indicated next to each wire.



AAWFZ0SH003101

When multiple connectors are connected to a component, each connector number is expressed on the wiring diagram with a replacing simplified symbol.

Example:
A: J14 means that the J14 connector is indicated by the substitute simplified symbol A.



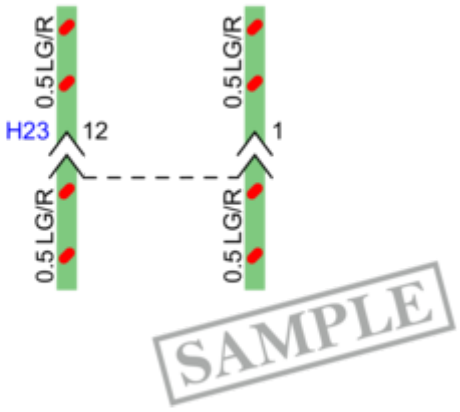
AAWFZ0SH003201

(b) Intermediate connector

Connectors that are connecting wires are indicated.

The groove side indicates female side connector, and the protruding side indicates male side connector.

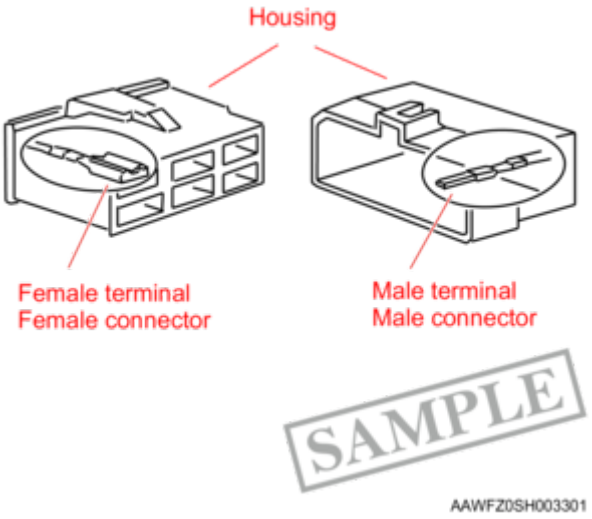
On the wiring diagram, when connectors are linked with a dashed line (----), it means that they are the same connector.



AAWFZ0SH001101

(c) Connector shape and terminal shape

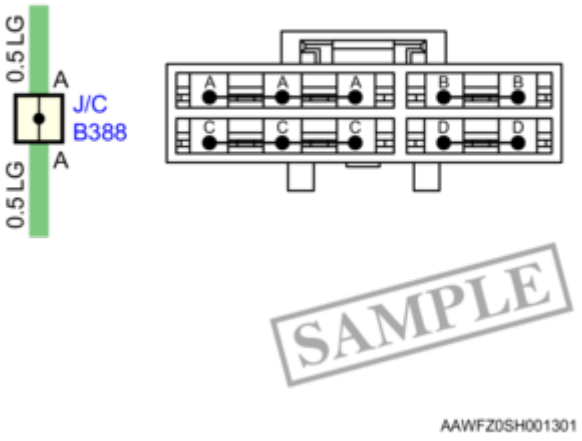
- Female connector……Indicates that the terminals are female.
- Male connector……Indicates that the terminals are male.



(d) Joint connector

A connector in which multiple terminals are collectively connected using joint terminals is indicated.

Alphabets indicate jointed groups (collectively connected terminals).

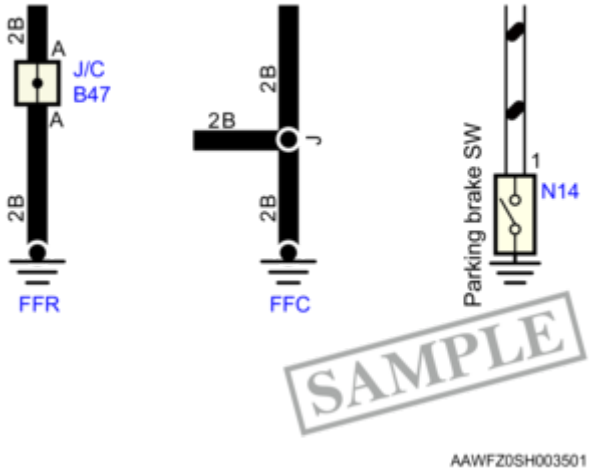


4. Ground Point

Ground positions are described using symbols.

Example:
FFR = Frame front right
FFC = Frame front center

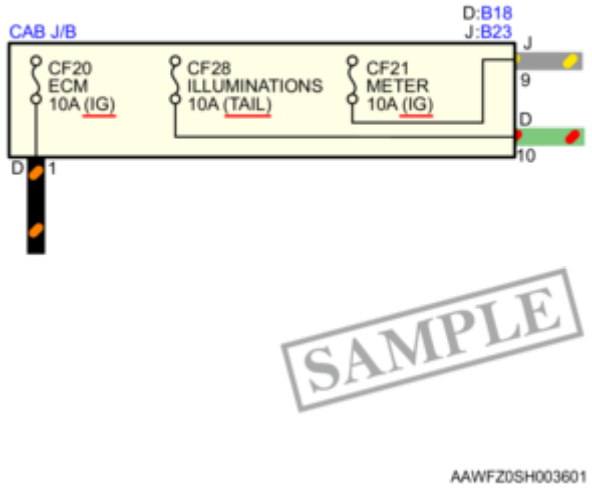
For the parking brake SW, etc., it indicates that a chassis ground is used (the switch itself is connected to a ground).



5. Fuse

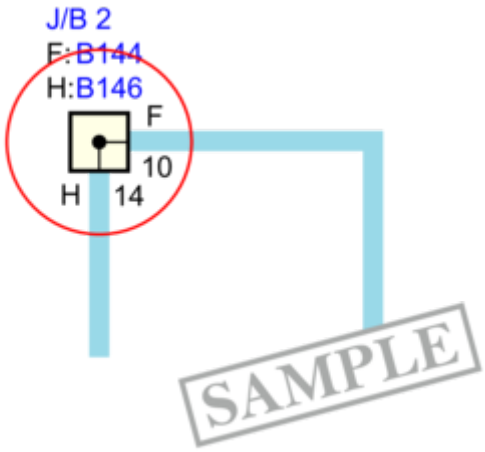
Fuse numbers, names, capacities, and energizing conditions (in parentheses) are shown.

Example
(IG) = Ignition switch energized with IG
(TAIL) = Lighting switch energized with ON



6. Junction block

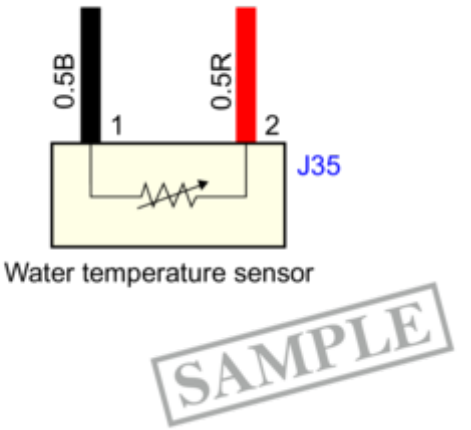
Internal connections within a junction block which is related to each circuit are indicated.



AAWFZ0SH001601

7. Component

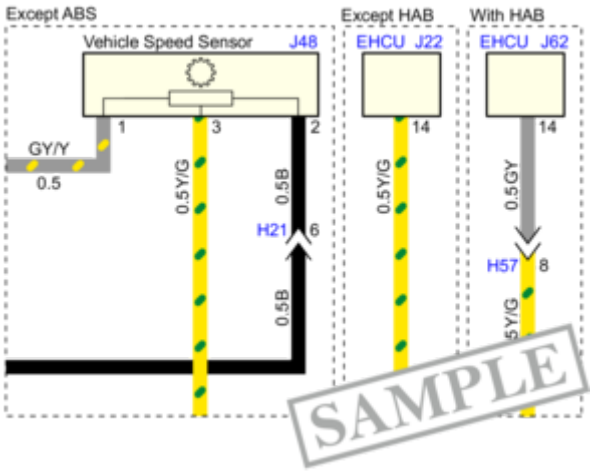
Components are shown as frames (yellow inside), and the name of the component is shown either inside or outside the frame.



AAWFZ0SH003701

8. Descriptions of specification differences

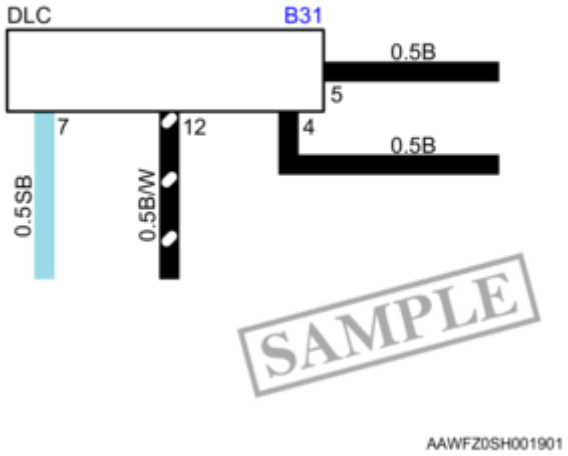
Differences in wiring diagram due to specification are indicated in a dashed border.



AAWFZ0SH003801

9. External connector

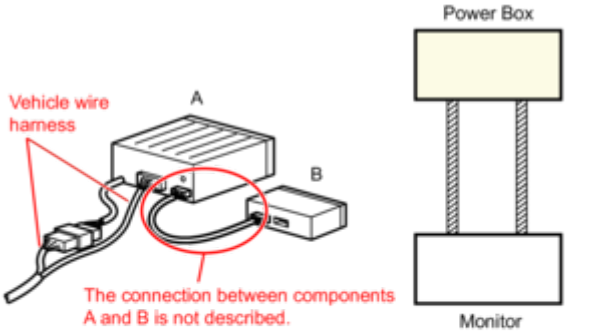
External connectors (DLC, service connectors, etc.), body modification parts, locally procured parts are represented as a frame (white inside).



AAWFZ0SH001901

10. Wiring not described

This document describes connections between the vehicle wire harness and each component. Therefore, connections made between components that do not pass through the vehicle wire harness are not described.



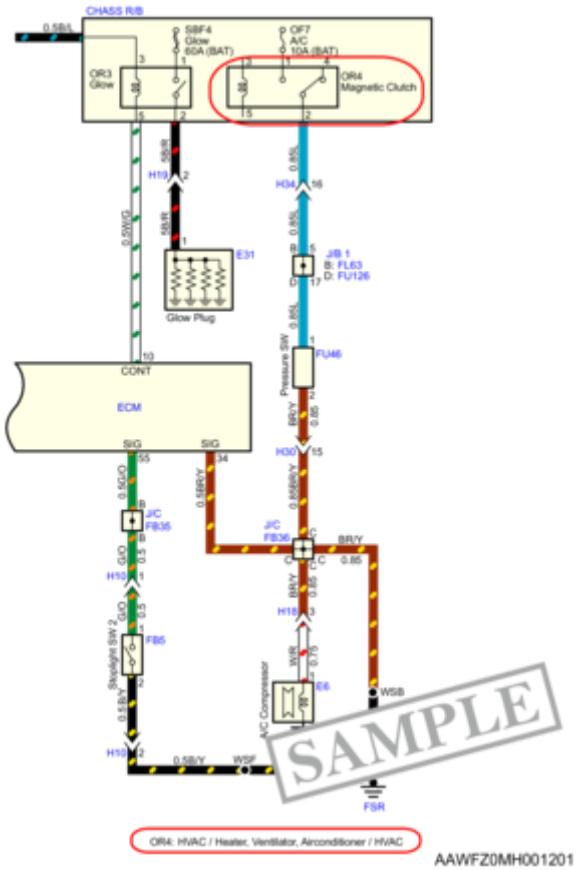
SAMPLE

AAWFZ0SH003901

11. Relay

Relay numbers, relay names, and relay internal circuits are shown.

If the relay is not completed in the relevant circuit, a line is added to the connection terminal and the referenced circuit names are indicated on the circuit diagram.



AAWFZ0MH001201

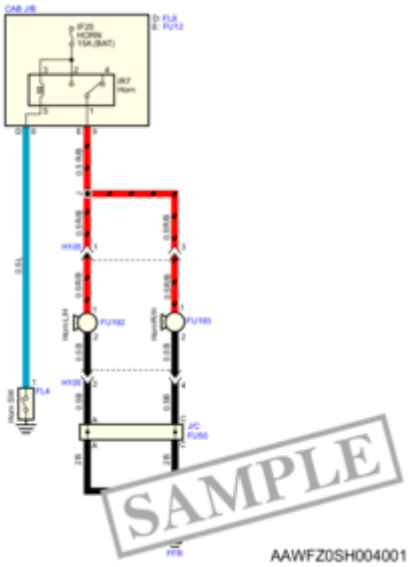
【Relay operation example】

When the horn switch (FL4) is pressed, current flows through pin 3 and pin 5 in the relay, and the coil in the relay is energized.

The contact point is moved by electromagnetism after the coil is energized, and pin 1 and pin 2 are connected.

When pin 1 and pin 2 are connected, power is supplied to the horn, and the horn sounds.

When the horn switch is disconnected, excitation in the coil ceases, the contact points are returned to the original status, pin 1 and pin 2 are disconnected (pin 1 and pin 4 are connected), and the horn stops sounding.

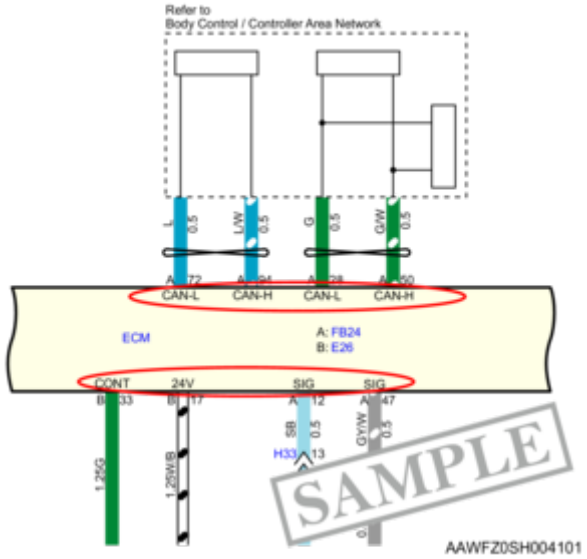


12. Control unit (C/U)

Signal names are indicated on the terminals inside the control unit illustrations.

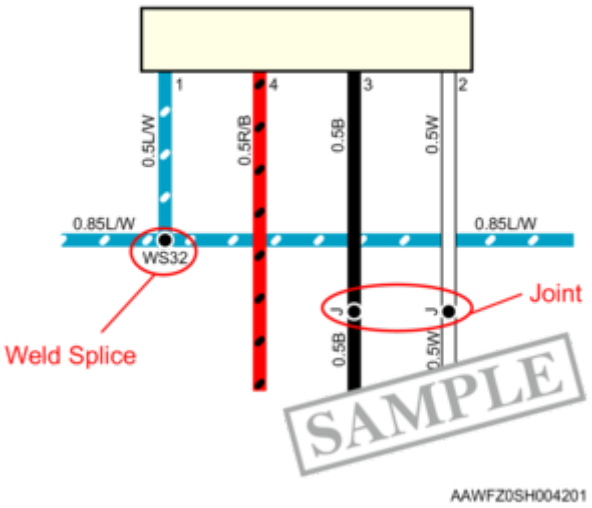
The meaning of the signal names are indicated below.

Signal name	Meaning
24 V	Battery voltage
5 V	Device voltage
GND	Ground
SIG	Signal input
CONT	Coil, LED drive
DRIVE	Motor drive
U, V, W	Three-phase motor drive
CAN-L	CAN-LOW signal
CAN-H	CAN-HIGH signal



13. Joint, weld splice

If the wiring is joined, the weld splice number is shown on the weld splice and joint terminal, and J is shown at the joint.



14. Circuit Symbols

Meaning of symbol	Symbol
Battery	
Fuse	
Slow blow fuse	
Fusible link (wire)	
Relay	
Switch	Diode	
Light emitting diode	
Single filament bulb	
Double filament bulb	
Meaning of symbol	Symbol
HID bulb

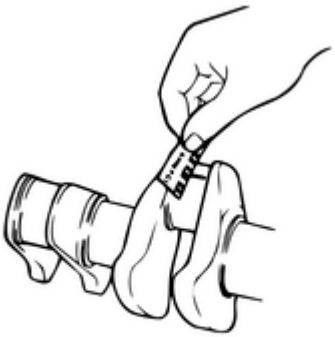
PLASTIGAUGE

1. Using the PLASTIGAUGE

PLASTIGAUGE type and measurable range	
Type	Measurable range
PG-1 (Green)	0.025 - 0.076 mm
PR-1 (Red)	0.051 - 0.152 mm
PB-1 (Blue)	0.102 - 0.229 mm

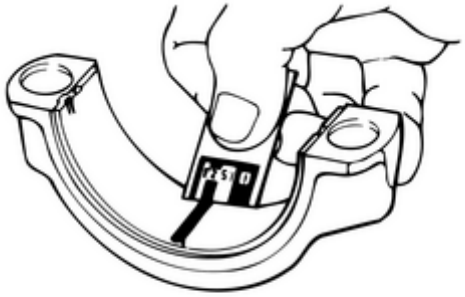


HCW30ASH002101

Method for measuring clearance between connecting rod bearing and crank pin
Clean the connecting rod and bearing, and assemble the bearing to the connecting rod.
Cut the PLASTIGAUGE to the width of the crank pin and lay it parallel while avoiding the crank pin oil hole.
Align the marking on the connecting rod with the marking on the cap, and assemble the connecting rod and cap to the crank pin. Apply molybdenum disulfide to the threaded portion and seating surface of the tightening bolt. Tighten alternately so the cap is tightened to the specified torque.
Gently remove the cap and the connecting rod, and measure the width of the flattened PLASTIGAUGE using the scale printed on the packaging.

Caution

- **Do not move the connecting rod when using PLASTIGAUGE.**



HCW30ASH002001

Method for measuring clearance between crank bearing and crank journal

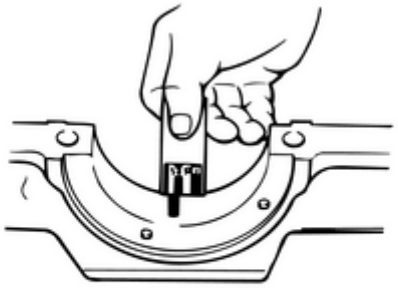
Clean the bearing, as well as the cylinder block and crankcase bearing mounting surfaces, and assemble to the cylinder block and crankcase.

Gently place the crankshaft on the cylinder block, and settle it by turning it approximately 30°.
Cut the PLASTIGAUGE to the width of the crank journal and lay it parallel while avoiding the journal oil hole.

Gently place the crankcase on the cylinder block, and apply molybdenum disulfide to the threaded portion and seating surface of the tightening bolt. Tighten the bolts to the specified torque in order.
Gently remove the crankcase, and measure the width of the flattened PLASTIGAUGE using the scale printed on the packaging.

Caution

- **Do not rotate the crankshaft when using PLASTIGAUGE.**



HCW30ASH002201

HCW30ASH002301

Handling electronic parts

1. Disconnecting the battery cables procedure

1. Models with battery equalizers

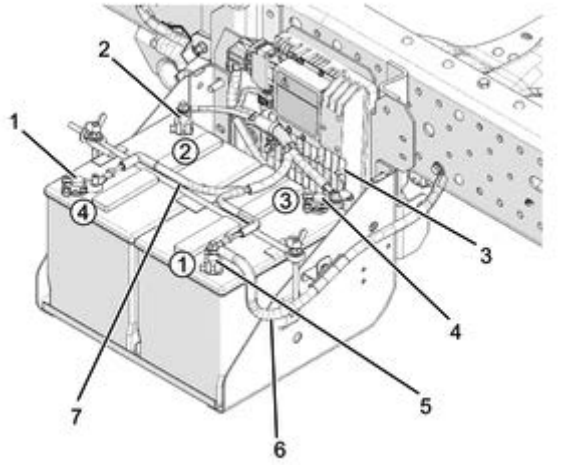
1) Turn OFF all the switches.

2) Disconnect the frame harness and battery ground cable from the battery terminals in the order shown in the diagram.

Caution

- **Do not disconnect the frame harness from the 12 V system side battery positive terminal within 15 seconds after the frame harness is disconnected from the 24 V system side battery negative terminal.**

12 V/24 V



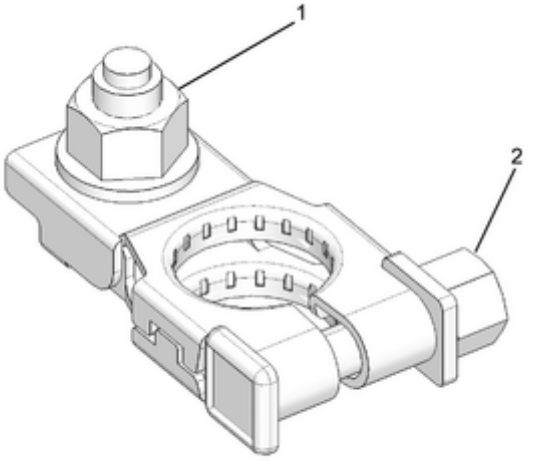
1. Battery positive terminal (24 V system side)
2. Battery negative terminal (24 V system side)
3. Battery equalizer
4. Battery positive terminal (12 V system side)
5. Battery negative terminal (12 V system side)
6. Battery ground cable
7. Frame harness

Caution

- **Because disconnecting the battery positive cable first may cause a short circuit, always disconnect the battery ground cable first.**

Note

- **Install in the reverse order to removal.**

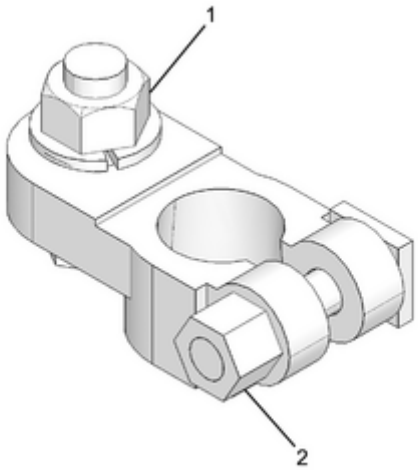


LNWE0ASH000601

1. M8 nut
2. M6 nut

Tightening torque: 10 to 12 N・m { 1.0 to 1.2 kgf・m / 89 to 106 lb・in } M8

Tightening torque: 3 to 6 N・m { 0.3 to 0.6 kgf・m / 27 to 53 lb・in } M6



LNWE0ASH000501

1. M8 nut
2. M6 nut

Tightening torque: 11 to 14 N・m { 1.1 to 1.4 kgf・m / 97 to 124 lb・in } M8

Tightening torque: 3 to 6 N・m { 0.3 to 0.6 kgf・m / 27 to 53 lb・in } M6

Caution

- **Clean the area surrounding the battery terminal, and apply a thin layer of grease to the terminal to prevent corrosion.**

2. Models without battery equalizers

1) Turn OFF all the switches.

2) Disconnect the battery ground cable from the battery terminal.

3) Disconnect the battery positive cable from the battery positive terminal.

4) For 24 V models, disconnect the battery cable from the battery terminal.

24 V

2. M6 nut

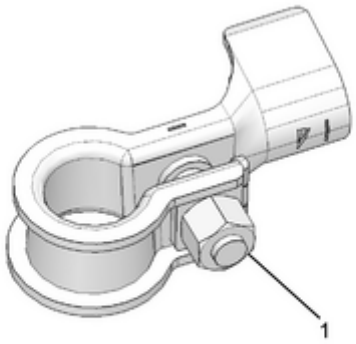
Tightening torque: 11 to 14 N・m { 1.1 to 1.4 kgf・m / 97 to 124 lb・in } M8

Tightening torque: 3 to 6 N・m { 0.3 to 0.6 kgf・m / 27 to 53 lb・in } M6



LNWE0ASH000301

1. Nut

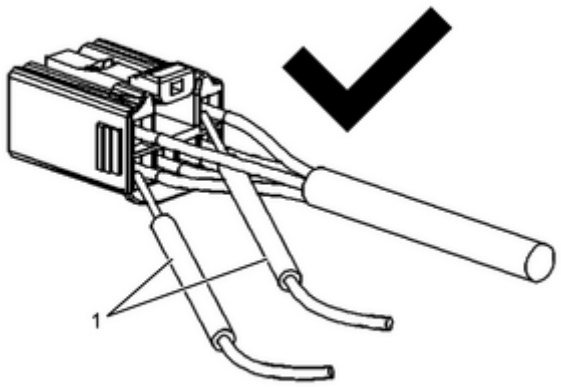
   Tightening torque: 3 to 6 N・m { 0.3 to 0.6 kgf・m / 27 to 53 lb・in }

Caution

- **Clean the area surrounding the battery terminal, and apply a thin layer of grease to the terminal to prevent corrosion.**

2. Connector circuit inspection

Insert the circuit tester probes from the harness side of the connector as indicated in the following diagram, and test for continuity. Upon completion, check the wire and connector for damage caused by the probe.

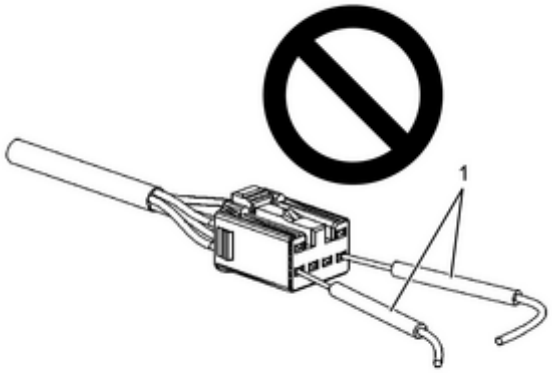


BLWD0ASH000101

1. Probe

Caution

- **Do not insert the probes from the connection opening area of the connector, because this will cause the connector terminals to break.**

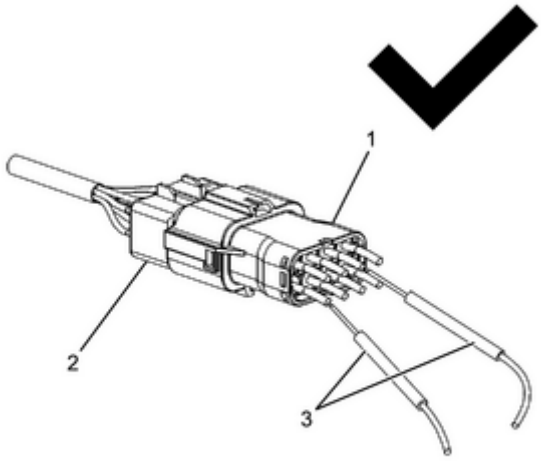


BLWD0ASH000201

1. Probe

Note

- **For waterproof connectors, the probes of the tester cannot be inserted from the wiring side due to the structure of the connectors. Therefore, inspect for continuity as indicated in the following diagram by connecting a testing connector prepared in advance to the connector to check, and connecting the probes of the tester to the harness of the testing connector.**

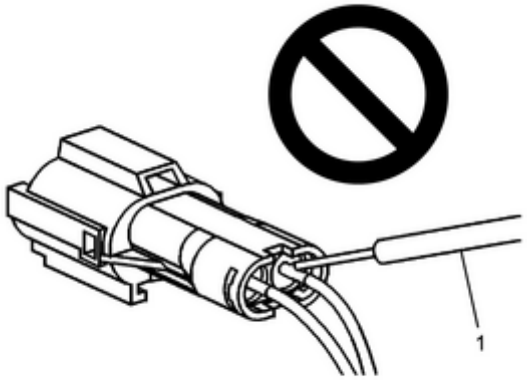


BLWD0ASH000301

1. Testing connector
2. Connector to check
3. Probe

Caution

- **Do not insert the tester probe into the rubber section of the waterproof connector, as doing so will reduce waterproofing capabilities and may result in corrosion.**

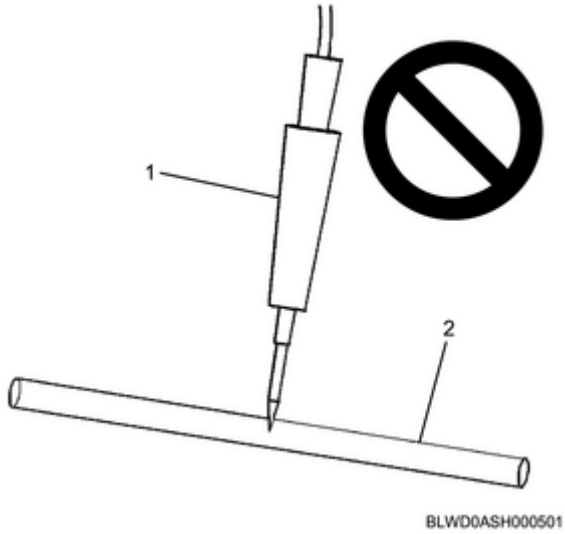


BLWD0ASH000401

1. Probe

Caution

- **Do not use an insulation piercing tester as it may cause the electrical wire to short circuit or corrode.**



BLWD0ASH000501

1. Insulation piercing tester
2. Electrical wire

3. Disconnecting connector terminals of built-in lock type

1) Unlock any double-locks.

2) Insert a thin screwdriver-shaped metal rod from the connector opening area.

3) Push the metal rod in the direction of the arrow to release the lock, and pull the harness out together with the terminal.

Wiring repair

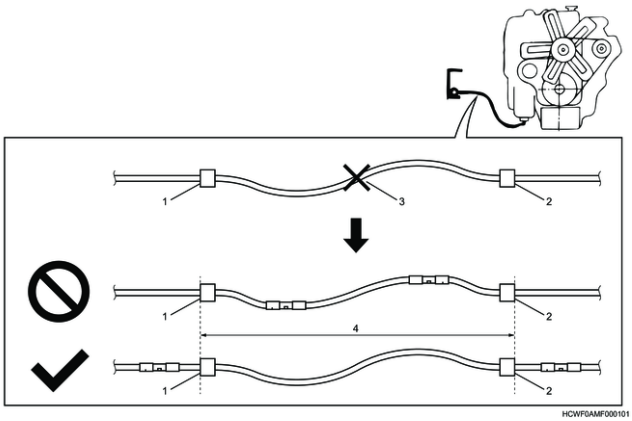
1. Wiring repair precautions

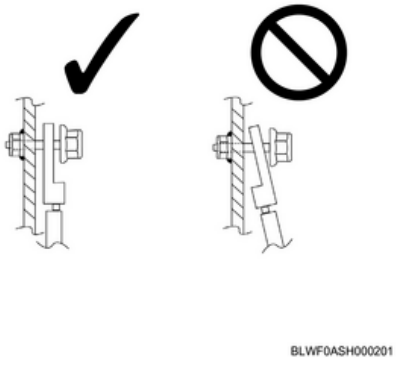
Warning

- **Do not perform battery cable connection repair, because this may lead to a vehicle fire.**
- **Because vehicle fires can be caused by electrical wire connections when wires twist together, or by insufficient insulation processing, be sure to follow the instructions in the workshop manual to perform appropriate connections and sound insulation processing.**
- **Because using a fuse with a capacity other than specified causes vehicle fire, make sure to use a fuse with the specified capacity.**

Caution

- **When repairing the wiring, start work after turning the ignition switch OFF and verifying that the lighting switches, etc., are OFF.**
- **Disconnect the battery cable from the battery negative terminal.**
- **For the battery cable, connect the battery negative terminal after all work is complete.**
- **If the fuse blows out, make sure to replace it with a non-defective fuse of the same capacity after identifying the cause of the blowout.**
- **Connecting the terminal poles and connectors incorrectly may result in component malfunction and damage, so be sure to connect them correctly.**
- **Do not perform connection repairs in areas with bending or runout, or areas that may be at a high temperature.**
- **Do not perform connection processing in areas that move relative to one another, such as the cab-to-frame and engine- or transmission-to-frame areas, etc.**
- **If wiring repair is needed on parts that move relative to each other, replace the whole span of the routing section with extension wiring, and perform connection processing to the parts outside of the span of the routing section.**





1. Fixed to non-moving parts (Fixture on the frame, etc.)
2. Fixed to moving parts (Fixture on the engine, etc.)
3. Damaged components
4. Span of the routing section

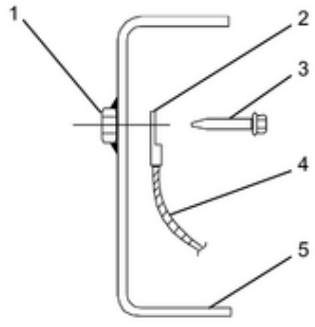
Caution

- **When repairing the wiring, take care not to damage nearby electrical wires and other components.**
- **When performing work, make sure to return the removed terminals, connectors, wiring, and clips to their original positions.**
- **If the clip used for fastening the harness is damaged, replace it with a new one.**
- **If the rubber or plastic coating of a metal clip peels off or has perforations or cracking, replace the clip with a new one.**
- **Because the existing ground point is set in a position that guarantees operation of the various devices, do not move it.**
- **For the ground wire, make sure to use a round terminal and securely fasten the wire to the frame and panel using the ground bolts.**
- **Do not tighten the extension ground wire together with the ground point, because looseness or poor connections may result.**
- **If the ground bolt is damaged, replace it with the specified ground bolt.**
- **If changing the ground point to a weld nut from the tap hole of the frame, use a ground bolt with a lock section long enough to twist more than 2 threads around the threaded portion of the weld nut.**

2. How to install ground wiring

Caution

- **Because the existing ground point is set in a position that guarantees operation of the various devices, do not move it.**
- **For the ground wire, make sure to use a round terminal and securely fasten the wire to the frame and panel using the ground bolts.**
- **Do not tighten the extension ground wire together with the ground point, because looseness or poor connections may result.**
- **If the ground bolt is damaged, replace it with the specified ground bolt.**
- **If changing the ground point to a weld nut from the tap hole of the frame, use a ground bolt with a lock section long enough to twist more than 2 threads around the threaded portion of the weld nut.**



BLWF0ASH000101

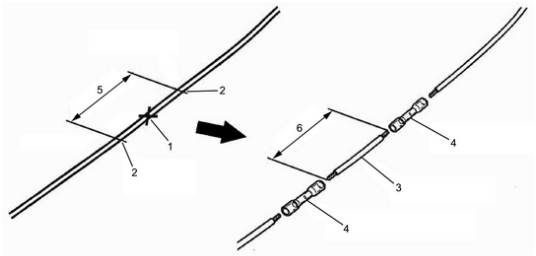
1. Weld nut
2. Round terminal
3. Ground bolt
4. Ground wire
5. Side member

Repair method of damaged wire

1. Electrical wiring connection(Joining)

If repairing a damaged circuit or reconstructing a damaged circuit (separate wiring), cut off the damaged part of the circuit and connect it with the electrical extension wire.

When connecting wires using the specified joint terminal, prepare an electrical extension wire the same length as the cut electrical wire.

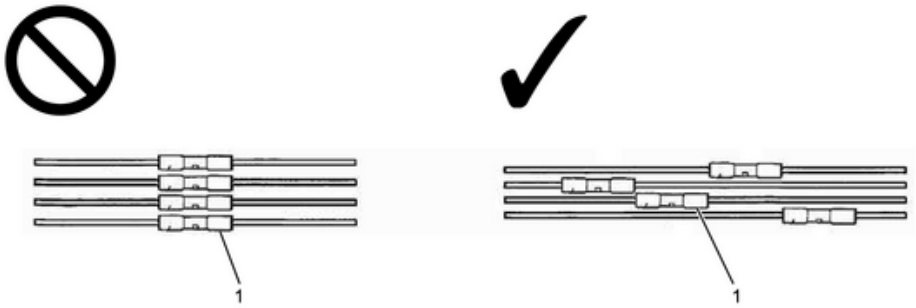


BLWF0ASF000101

1. Damaged components
2. Cut location
3. Electrical extension wire
4. Joint terminal
5. Length of cut location
6. Length of the electrical extension wire

Note

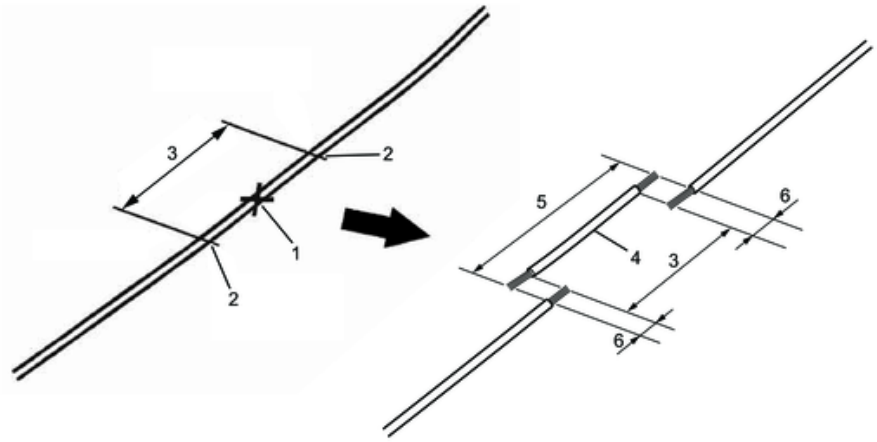
- **When connecting 4 electrical wires or more, connect them by sliding them back and forth without gathering them into the same place.**
- **Even when connecting 3 electrical wires or less, connect them by sliding them back and forth even if they do not fit into the protective material.**



BLWF0ASF000401

2. Joint terminal

If connecting wires using soldering or joint connectors other than those specified, etc., prepare a length of the electrical extension wire equal to the sum of the lengths of the 2 electrical wire strips and the length of the cut electrical wire.



HCWF0ASF000101

1. Damaged components
2. Cut location
3. Length of the wire to be cut
4. Electrical extension wire
5. Length of the electrical extension wire
6. Length of the electrical wire strip

3. Repair method for damaged connectors and components near the connectors

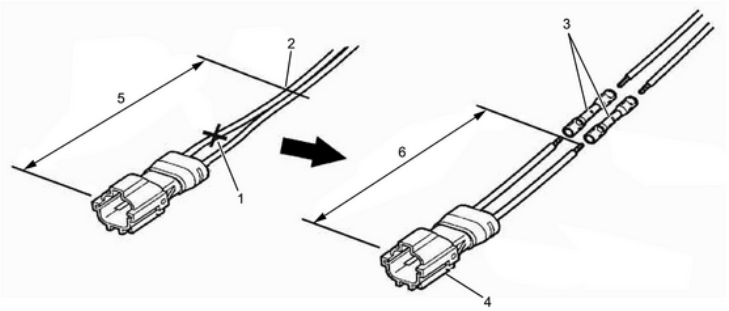
If the connectors or the components near the connectors are damaged, prepare a replacement connector and perform connection processing.

1) For the electrical extension wire and replacement connector wires, make sure the diameters of the electrical wire and copper wire being repaired are the same, and use the same electrical wire color whenever possible.

2) Taking workability into consideration, the length of the electrical wire of the replacement connector should be 100 mm {3.9 in} or more.

3) When connecting wires using the specified joint terminal, prepare a replacement connector the same length as the cut electrical wire.

4) If connecting the replacement connector using soldering or joint connectors other than those specified, etc., the length should be the sum of the lengths of the overlapped bonded sections.



1. Damaged components
2. Cut location
3. Joint terminal
4. Connector
5. Length of cut location
6. Length of the replacement connector

4. Wire splicing method

Connection method using joint terminal (electrical wires with a diameter of 2.0 mm2 or less)

Joint terminal type			
Part number	Electrical wire diameter	Color	Length of the electrical wire strip
897169-4730	0.3 to 0.5 mm2	Yellow	6 to 7 mm { 0.24 to 0.28 in }
897169-4740	0.75 to 1.25 mm2	Red	7 to 8 mm { 0.28 to 0.31 in }
897169-4750	2.0 mm2	Blue	7 to 8 mm { 0.28 to 0.31 in }

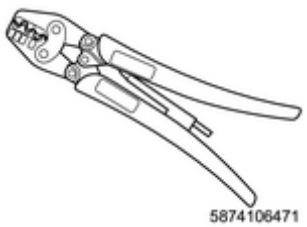
1) Strip the electrical wire repair locations and electrical extension wire.

Note

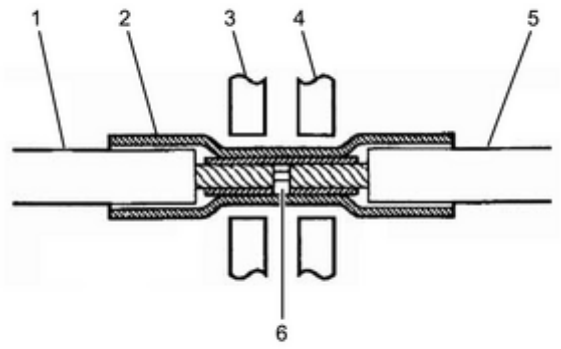
- **Determine the electrical wire strip length based on the electrical wire diameter.**
- **Use a wire stripper of the appropriate length to avoid cutting the core wire.**

2) Insert the stripped electrical wire up to the central stopper of the joint terminal.

3) Pressure bond the joint terminal using the special tool.



SST: 5-8741-0647-1 - terminal pincers

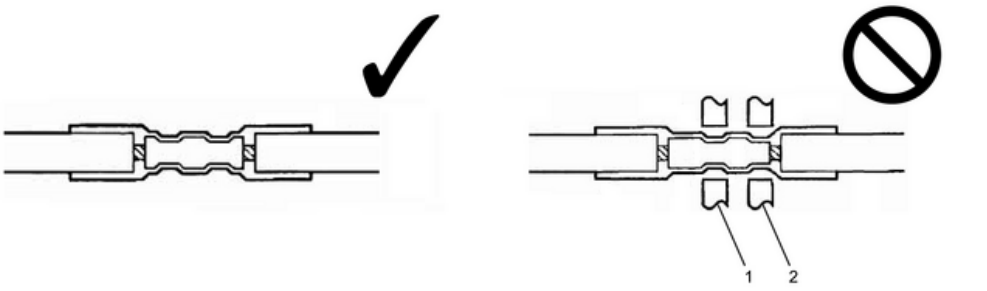


BLWF0ASH000401

1. Electrical wire
2. Joint terminal
3. Pressure bonding tool
4. Pressure bonding tool
5. Electrical extension wire
6. Central stopper

Caution

- **Pressure bond the joint terminal in the correct position as shown in the following diagram.**



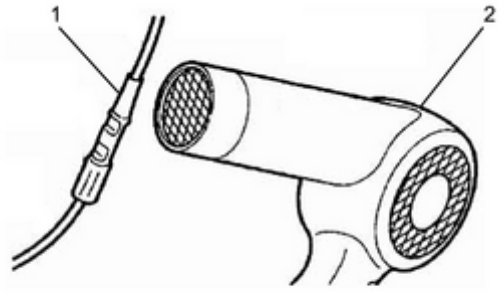
BLWF0ASF000501

1. The center of the joint terminal is pressure bonded.
2. The copper sleeve end section is pressure bonded.

4) Heat the joint terminal surface using a heat gun, and heat shrink the outer tube.

Note

- **Reference heating temperature: 120 °C {248 °F}**



BLWF0ASH000501

1. Joint terminal
2. Heat gun

Note

- **Heat the tube until semitransparent resin seeps out of both ends.**
- **Even if the joint terminal tube is damaged and a hole forms during pressure bonding work, covering the hole with semitransparent resin and heating it will conceal the hole and make the tube sufficiently waterproof, so performing work again is unnecessary.**

2. Connection treatment method using soldering (electrical wires with a diameter of 2.0 mm2 or more)

If there are no joint terminals, connect by soldering or by using commercial terminals, and perform waterproofing treatment using butyl rubber. It is recommended that joint terminals be used if connecting electrical wires with a diameter of up to 2.0 mm2.

Note

- **Because of the possibility of causing open circuits, do not make connections for components with strong vibrations, such as the engine and the transmission, by soldering. Connecting by pressure bonding is recommended.**

Caution

- **Do not connect the following sections.**
  - Sections with bending and relative movement
  - Sections that bear stress
  - Sections that become high temperature

Bonding type	Part number	Purpose
Pressure-bonded terminal	Commercial product	Bonding
Solder	Commercial product	
Butyl rubber	1-82698-2630	Waterproofing
Vinyl tape	Commercial product	Insulation

1) Strip the electrical wire repair locations and electrical extension wire.

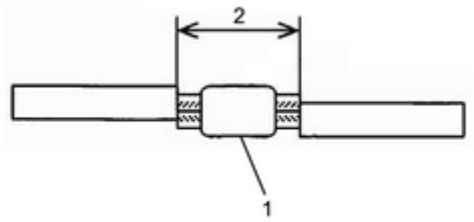
Note

- **For the electrical wire strip length, if there are recommended dimensions for the wiring method, then use those dimensions.**
- **Use a wire stripper of the appropriate length to avoid cutting the core wire.**

Caution

- **Soldering is the recommended connection method for electrical wires with a diameter of 2.0 mm2 or more, but pressure bonding is recommended for components with strong vibration, such as the engine and transmission.**

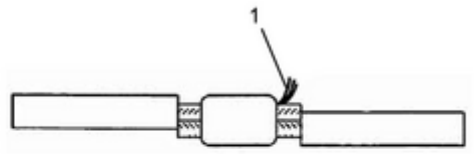
2) Solder the overlapped section of the core wire.



BLWF0ASH000601

1. Soldering
2. Electrical wire overlapping

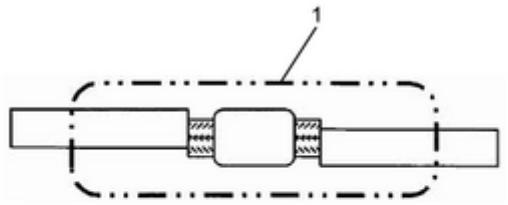
3) Remove the protruding copper wires and solder burrs.



BLWF0ASH000701

1. Protruding copper wire, solder burrs

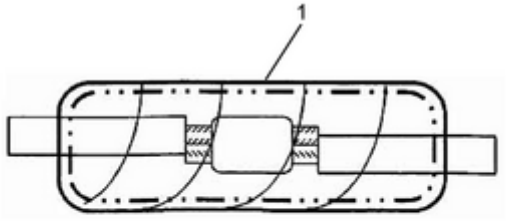
4) Using butyl tape, wrap the electrical wire up to the coated section to waterproof it.



BLWF0ASH000801

Butyl tape

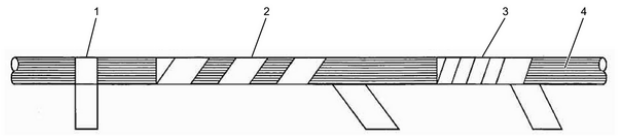
5) Using vinyl tape, completely cover the sections wrapped in butyl rubber to insulate them.



BLWF0ASH000901

1. Vinyl tape

3. Electrical wire binding method using vinyl tape



BLWF0ASF000301

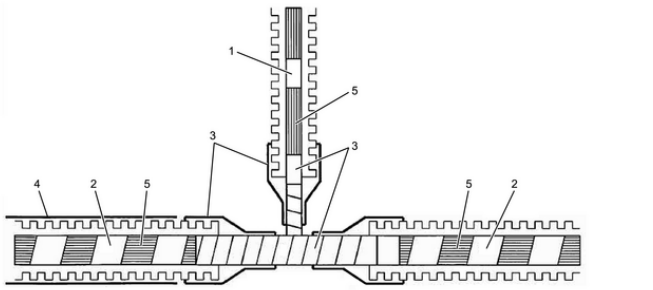
1. Tape layering
2. Staggered taping
3. Half-overlapping
4. Electrical wire

Tape layering
This is a taping method in which the same position is wrapped repeatedly, and is used for bundling electrical wires and for markings.

Staggered taping
This is a wrapping method in which each piece of tape is separated by a space equal to the width of the tape. This method is used to prevent corrugated tubes and the electrical wires inside corrugated tubes from opening.

Half-overlapping
This is a wrapping method in which each piece of tape is stacked such that it overlaps half of the previous piece. This method is used to reinforce electrical wires without protective material and corrugated tube end sections, as well as to prevent corrugated tubes from opening.

Vinyl tape wrapping method



BLWF0AMF000101

1. Tape layering
2. Staggered taping
3. Half-overlapping
4. Tape layering, staggered taping, or half-overlapping
5. Electrical wire

Recommended liquid gasket

1. Using the thread liquid gasket

1. General precautions

Make sure to use liquid gasket with the following product names or equivalent. Follow the handling precautions for the product.

Type	Product name	Manufacturer	Location of use (Reference)
Silicon type (Room-temperature vulcanized)	ThreeBond 1207B ThreeBond 1207C ThreeBond 1215 ThreeBond 1216 ThreeBond 1281	ThreeBond ThreeBond ThreeBond ThreeBond ThreeBond	Engine oil seal retainer Engine oil pan Timing gear case Cylinder head cover Fuel supply pump Water pump Rear axle etc.
Water soluble	ThreeBond 1141E	ThreeBond	
Solvent based	ThreeBond 1102 ThreeBond 1104 ThreeBond 1194	ThreeBond ThreeBond ThreeBond	
Anaerobic	LOCTITE 515 LOCTITE 518 LOCTITE 17430 FMD127	LOCTITE LOCTITE LOCTITE LOCTITE	Engine oil seal retainer Water pump etc.

Caution

- **Do not use LOCTITE 515, 518, or FMD 127 as they are anaerobic and do not provide sufficient effect if there is a 0.25 mm {0.010 in} or larger gap between the contact surfaces of metals.**
- **For areas where liquid gasket is used, completely remove any old liquid gasket from each part and mating part using a scraper, and clean using a shop cloth to remove any adherence of oil, moisture, or foreign material whenever disassembly is performed.**
- **If gasket remover is used when cleaning, waiting approximately 10 minutes after application before performing the cleaning work can improve the workability. However, do not use on plastic parts or painted parts.**

2. Application precautions

Caution

- **Thoroughly apply a liquid gasket with the specified bead width to one side of the contact surface.**
- **Be careful not to excessively or insufficiently apply liquid gasket.**
- **Be sure to overlap the start and the end of the liquid gasket application.**
- **If the workshop manual specifies an application method, follow that method.**

3. Assembly precautions after application

Caution

- **Assemble within 15 minutes of applying the liquid gasket. Also, if 15 minutes or more have passed, remove the liquid gasket and reapply.**
- **Be careful not to misalign the mating parts, and reapply if misalignment occurs.**
-
-

Recommended thread locking agent

1. Using the thread locking agent

Type	Color
LOCTITE 242	Blue
LOCTITE 262	Red
LOCTITE 271	Red

Caution

- **Thoroughly remove dirt, moisture, and grease from the threaded portions of the parts to which thread locking adhesive will be applied.**
  Also, if there is any adhesive residue, remove it with a brush, etc.
- **Before tightening, verify that the cleaned sections are dry.**
- **After tightening, do not apply excessive torque or vibration for at least 1 hour until the thread locking adhesive hardens.**
- **If applying thread locking adhesive to bolts, apply to the fitting section with the female screw.**

16. Flange bolt (9.8, 9T)

2. Tightening torque for flare nuts

A-type flare nut			
Pipe diameter	HEX	Thread size	Tightening torque*
4.76 mm {0.19 in}	10 mm	M10 x 1.0	13 to 18 N・m { 1.3 to 1.8 kgf・m / 10 to 13 lb・ft } Iron
			9 to 15 N・m { 0.9 to 1.5 kgf・m / 7 to 11 lb・ft } Non-ferrous
6.35 mm {0.25 in}	12 mm	M12 x 1.0	23 to 35 N・m { 2.3 to 3.6 kgf・m / 17 to 26 lb・ft } Iron
8.0 mm {0.31 in}	14 mm	M14 x 1.5	29 to 39 N・m { 3.0 to 4.0 kgf・m / 21 to 29 lb・ft } Iron
10.0 mm {0.39 in}	17 mm	M16 x 1.5	45 to 55 N・m { 4.6 to 5.6 kgf・m / 33 to 41 lb・ft } Iron
C-type flare nut			
Pipe diameter	HEX	Thread size	Tightening torque*
4.76 mm { 0.19 in }	14 mm	M10 x 1.0	13 to 18 N・m { 1.3 to 1.8 kgf・m / 10 to 13 lb・ft } Iron
6.35 mm { 0.25 in }	17 mm	M12 x 1.5	25 to 35 N・m { 2.5 to 3.6 kgf・m / 18 to 26 lb・ft } Iron
			19.6 to 23.5 N・m { 2.0 to 2.4 kgf・m / 14 to 17 lb・ft } Non-ferrous
8.0 mm { 0.31 in }	17 mm	M14 x 1.5	25 to 39 N・m { 2.5 to 4.0 kgf・m / 18 to 29 lb・ft } Iron
			19.6 to 23.5 N・m { 2.0 to 2.4 kgf・m / 14 to 17 lb・ft } Non-ferrous
10.0 mm { 0.39 in }	19 mm	M16 x 1.5	45 to 80 N・m { 4.6 to 8.2 kgf・m / 33 to 59 lb・ft } Iron
			39.2 to 44.1 N・m { 4.0 to 4.5 kgf・m / 29 to 33 lb・ft } Non-ferrous
12.0 mm { 0.47 in }	24 mm	M16 x 1.5	65 to 115 N・m { 6.6 to 11.7 kgf・m / 48 to 85 lb・ft } Iron
			49.0 to 58.8 N・m { 5.0 to 6.0 kgf・m / 36 to 43 lb・ft } Non-ferrous
15.0 mm { 0.59 in }	30 mm	M22 x 1.5	80 to 130 N・m { 8.2 to 13.3 kgf・m / 59 to 96 lb・ft } Iron
			49.0 to 58.8 N・m { 5.0 to 6.0 kgf・m / 36 to 43 lb・ft } Non-ferrous

Note

- **Asterisks (*) indicate that the tightening torque varies depending on the material of the opposing side. Non-ferrous: Aluminum and brass**

3. Tightening torques for PT screws and connectors

Caution

- **Apply a liquid sealing agent equivalent to LOCTITE 575 to the threaded portion and tighten. Do not use seal tape, etc.**
- **The tightening torque for connectors (except brass tapered screws) only applies when the mating side is not made of aluminum (however, it does apply for aluminum air tanks, etc.).**
- **Completely dry and then let air in after tightening.**

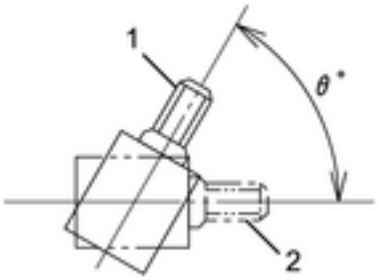
PT screw, connector (Brass tapered screws)	
Thread size	Tightening torque
PT 1/8	2.0 to 14.7 N・m { 0.2 to 1.5 kgf・m / 18 to 130 lb・in }
PT 1/4	4.9 to 15.7 N・m { 0.5 to 1.6 kgf・m / 4 to 12 lb・ft }
PT 3/8	9.8 to 16.7 N・m { 1.0 to 1.7 kgf・m / 7 to 12 lb・ft }
PT 1/2	9.8 to 17.7 N・m { 1.0 to 1.8 kgf・m / 7 to 13 lb・ft }

PT screw, connector (Except brass tapered screws)	
Thread size	Tightening torque
PT 1/8	5.9 to 11.8 N・m { 0.6 to 1.2 kgf・m / 52 to 104 lb・in }
PT 1/4	14.7 to 29.4 N・m { 1.5 to 3.0 kgf・m / 11 to 22 lb・ft }
PT 3/8	29.4 to 39.2 N・m { 3.0 to 4.0 kgf・m / 22 to 29 lb・ft }
PT 1/2	29.4 to 58.8 N・m { 3.0 to 6.0 kgf・m / 22 to 43 lb・ft }
PT 3/4	58.8 to 98.0 N・m { 6.0 to 10.0 kgf・m / 43 to 72 lb・ft }

Elbow-type connector	
Thread size	Tightening torque
PT 1/8	5.9 N・m { 0.6 kgf・m / 52 lb・in }
PT 1/4	14.7 N・m { 1.5 kgf・m / 130 lb・in }
PT 3/8	29.4 N・m { 3.0 kgf・m / 22 lb・ft }
PT 1/2	29.4 N・m { 3.0 kgf・m / 22 lb・ft }
PT 3/4	58.8 N・m { 6.0 kgf・m / 43 lb・ft }

Caution

- **For elbow-type connectors, tighten to the minimum torque in the above table, and then further tighten until the angle is in the correct position.**



LNWA0ASH000301

WORKSHOP MANUAL

Cummins

Introduction

General Information

Cummins Inc. manuals are created to support Cummins® products. For information on components or fault codes not supplied by Cummins Inc., contact the original equipment manufacturer or supplier.

The content of this manual is based on the information in effect at the time of publish. Cummins Inc. reserves the right to make any changes at any time without obligation. If differences are found between your engine and the information in this manual, contact a Cummins® Authorized Repair Location.

About

Cummins® manuals are divided into sections. Each section consists of procedures which are associated with the title of the section.

When viewing a manual online, the sections of the manual are displayed to the left of the procedure display. If a section is clicked, it will expand to show the procedures within that section. To view a procedure, click on the procedure title.

When viewing a printed manual, the table of contents provides the list of sections and their subsequent procedures, with page numbers located to the right.

ANADOLU ISUZU

Last Modified: 20-Feb-2019

General Information

This manual is divided into the same group system used for previous manuals and the Cummins' filmcard system. Section 00 is organized into a logical sequence of engine disassemble/assemble, all other sections are in numerical sequence. Refer to the Table of Contents at the front of the book to determine the section that details the desired information.

The disassemble/assemble sections of this manual is divided into the same group system used for previous manuals and the Cummins' filmcard system.

Section 00 is organized into a logical sequence of engine disassemble/assemble, all other sections are in numerical sequence. Refer to the Table of Contents at the front of the book to determine the section that details the desired information.

Each section contains the following in sequence:

- Table of Contents
- Required Service Tool Listings
- General Information containing the basic service, maintenance, design and revision information necessary to assist in the rebuild of an engine or a component
- Procedure instructions for the disassembly, inspection, maintenance, and assembly that can be required to rebuild an engine; additional procedures that are **not** necessary during **every** rebuild, but can be necessary, are included. These procedures depend on the length of time an engine has been in service and the conditions of the parts.

All the procedures are identified with a name and a number. Each digit in the procedure number has a specific meaning.

The first three digits of the number refer to the specific section that the procedure can be found within the manual. In this example, “001” represents Section 01 - Cylinder Block. This number will range from 000 to 022.

The second three digits of the number are unique and refer to a specific subject. In this example, “028” represents Cylinder Liner. This number will range from 001 to 999.

Refer to Section V for specifications recommended by Cummins Engine Company, Inc. for your engine. Specifications and torque values for each engine system are given in that section.

Note : Discharge of oil or oily water into or upon the water is a direct violation of today's laws. Violators are subject to a penalty of various monetary charges. Dispose of these substances in accordance with standards set by the local enviromental governing agency.

ANADOLU ISUZU
AFTER SALES

General Information

The symbols are used **only** in printed manuals to help communicate the intent of the instructions. Symbols will **not** appear in the online version of this procedure. When one of the symbols appears in the printed manual, it conveys the meaning defined below.

Note : It is possible to have four symbols for each text and graphic combination.

⚠ WARNING ⚠

Serious personal injury or extensive property damage can result if the warning instructions are not followed.

⚠ CAUTION ⚠

Minor personal injury can result or a part, and assembly, or the engine can be damaged if the caution instructions are not followed.

Indicates a **REMOVAL** or **Dissassembly** step.

Indicates an **INSTALLATION** or **ASSEMBLY** step.

INSPECTION is required.

ANADOLU ISUZU AFTER SALES

CLEAN the part or assembly.

PERFORM a mechanical or time **MEASUREMENT**.

LUBRICATE the part or assembly.

Indicates that a **WRENCH** or **TOOL SIZE** will be given.

TIGHTEN to a specific torque.

ANADOLU ISUZU AFTER SALES

PERFORM an electrical **MEASUREMENT**.

Refer to another location in this manual or another publication for additional information.

The component weighs 23kg [50 lbs] or more. To reduce the possibility of personal injury, use a hoist or get assistance to lift the component.

General Information

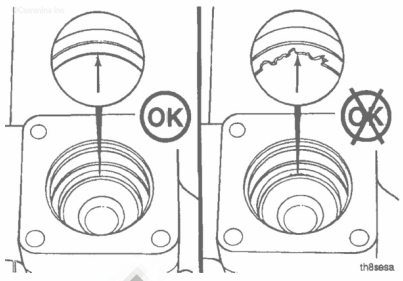
Some of the illustrations throughout this manual are generic and will **not** look exactly like the engine or parts used in your application. The illustrations can contain symbols to indicate an action required and an acceptable or **not** acceptable condition.



The illustrations are intended to show repair or replacement procedures. The procedure will be the same for all applications, although the illustration can differ.

AFTER SALES

Last Modified: 12-Mar-2002

Important Safety Notice

Read and understand the safety information and precautions before performing any repair or operating equipment. This procedure contains general safety precautions that **must** be followed to provide personal safety. **Always** follow procedures to mitigate safety concerns.

Work Environment

Follow these recommended practices when servicing products.

- **Always** follow on-site safety requirements.
- **Always** follow local training, certification, authorization, and specific customer requirements. Do **not** work on products unless proper training has been completed to allow safe repair completion. Do **not** operate equipment unless proper training has been completed to allow safe operation..
- Work in a well-ventilated area away from ignition sources.
- If adverse weather conditions are present, take appropriate safety precautions when performing work.
- **Always** be aware of hazardous conditions that may exist in the work environment.

Best Practices

Follow these recommended practices when servicing or operating equipment.

- **Always** wear protective glasses and protective shoes.
- Remove rings, watches, long jewelry, or metallic items.
- Do **not** wear loose fitting or torn clothing, jewelry, long hair, etc.. These increase the risk for personal injury.
- Do **not** perform any repairs, or operate equipment, when fatigued or impaired due to drugs or alcohol.
- **Always** use tools that are in good condition.
- Do **not** work on equipment with the key switch ON or that is running unless otherwise directed by troubleshooting procedures.
- If any work **must** be performed while the key switch is ON or the unit is running, use extreme caution around hot components, moving parts, etc.
- Exercise caution when working on products that have just been turned off. Hot parts may cause burns or ignite or melt common materials.

- Do **not** bleed the fuel system of a hot engine. Contact with hot manifolds or other components can cause a fire.
- Do **not** attempt to rotate the crankshaft by pulling or prying on the fan. **Only** use proper engine barring techniques.
- Do **not** lift components that weigh 23 kg [50 lb] or more. Use mechanical help or seek assistance.
- Exercise caution when working around rotating parts. Rotating parts can cause cuts, mutilation, or strangulation.
- Exercise caution when working on electrical components. High voltages can cause serious injury or death.
- Relieve system pressure as instructed before removing or disconnecting lines, fittings, or related items.
- **Always** test for pressure leaks as instructed.
- **Always** torque fittings and connections to the required specifications. Over or under tightening can damage threads and create leaks.
- **Always** use the same fastener part number, or equivalent, when replacing fasteners.

Perform the following prior to beginning work on any products.

- Shutdown the equipment unless otherwise directed by troubleshooting procedures.
- **Always** allow the product to cool.
- **Always** ensure the product is properly supported by blocks or stands. Do **not** work on a product supported **only** by lifting jacks or hoists.
- Disconnect the battery unless otherwise directed by troubleshooting procedures.
- Disconnect the starting motor, if equipped, unless otherwise directed by troubleshooting procedures.
- Place a "Do NOT Operate" tag in the operator area or near the product controls.
- Become familiar with the tools required for performing the task at hand and how to use those tools correctly.
- Use only genuine Cummins or Cummins Recon replacement parts as instructed.

Personal Protective Equipment (PPE)

To reduce the possibility of personal injury, personal protective equipment (PPE) should be utilized. Various types of PPE are listed below. Use proper judgment to determine which types of PPE are required for a given task. **Always** meet on-site safety regulations for required PPE. Proper maintenance of safety equipment **must** be practiced. Integrity of safety equipment **must** be checked to ensure equipment functionality is maintained.

Eye Protection

Eye protection **must always** be worn. Wear appropriate eye protection based on the task being completed. Types of eye protection to consider are listed below.

- Safety glasses. Exposure to flying particles or debris, chemicals or caustic liquids, gases or vapors.

ANADOLU ISUZU PARTS SALES

- Polarized safety glasses. Working in outdoor or bright lighting environments.
- Over-the-glass safety glasses. Add protection to prescription glasses.
- Safety goggles. Handling caustic liquids or chemicals.
- Shade or arc rated eyewear. Exposure to welding. Use appropriate filter ratings.

Foot Protection

Protective shoes **must always**be worn. Wear appropriate foot protection based on the task being completed. Types of protective footwear to consider are listed below.

- Steel toed shoes. Exposure to falling or rolling objects. Working with or around parts, tools, and equipment.
- Chemical resistant. Exposure to chemicals and other fluids.
- Overshoes and overboots. Add protection to everyday work shoes.
- Foot, toe, and metatarsal guards. Add protection to everyday work shoes.
- Electrical hazard safety toe shoes. Exposure to electrical hazards.
- Leather footwear or shoe protectors. Exposure to welding or arc flash.
- Cold protection. Exposure to cold weather.

Head and Face Protection

Wear appropriate face protection based on the task being completed. Types of head and face protection to consider are listed below.

- Hard hats. Exposure varies. Consider welding, heat, or arc-rated.
- Visors. Exposure varies. Consider welding, heat, or arc-rated.
- Face liners. Exposure to cold weather.
- Face shields. Exposure to liquid splash. Handling caustic liquids or chemicals.

Hand Protection

Wear appropriate type and fit of gloves based on the task being completed. Types of protective gloves to consider are listed below.

- Heat resistant or insulated. Exposure to hot items.
- Flame resistant. Exposure to welding or arc flash.
- Impact resistant. Performing repetitive impact and vibration work. Using pneumatic tools.
- Impervious. Exposure to high pressure fluids.
- Chemical resistant. Exposure to chemicals, fluids, or batteries.
- Cut resistant. Handling sharp objects or tools.
- Cold weather. Exposure to cold weather.

Hearing Protection

When working around operating equipment, appropriately rated hearing protection should be worn. Types of hearing protection to consider are listed below.

- Single use ear plugs.
- Pre-formed ear plugs.
- Ear muffs.

Protective Clothing

Wear appropriate protective clothing based on the task being completed. Types of protective clothing to consider are listed below.

- Flame resistant. Exposure to electrical hazards. Exposure to oil and gas or generator set applications. Performing welding.
- Chemical resistant. Exposure to chemicals.
- High visibility. Exposure to reduced visibility working environments. Working on mining, oil and gas, or sites with large equipment.

Respiratory Protection

Wear appropriate respiratory protection based on the task being completed. Types of respiratory protection to consider are listed below.

- Disposable respirators. Exposure to dust and particles, welding fumes, nuisance odors, nuisance level acid gas.
- Reusable respirators. Exposure to cleaning, machining, welding, sanding, grinding, etc.

Fall Protection

Utilize fall protection if a task is being completed more than 1.2 m [4 ft] above a solid surface. Types of fall protection to consider are listed below.

- Fall harness and lanyard combinations.
- Safety nets.
- Guardrails.

Fuels

Follow these recommended practices when interacting with equipment that uses different fuel types. For information regarding proper handling of various substances, refer to the manufacturer's safety data sheet.

Diesel Fuel

- Protect eyes.
- Protect skin.
- **Always** test for fuel leaks as instructed.
- Do **not** dilute.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Provide extra ventilation to the work area.
- Do **not** troubleshoot or repair fuel leaks while the engine is running.
- If material is spilled, avoid contact and dispersal with runoff, soil, waterways, drains, and sewers. Absorb with sand, clay, or commercial absorbent. Transfer to containers and neutralize the material. Flush spill area with soap and excess water.
- Report spills effecting water source contamination to local authorities immediately.
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.
- **Always** torque fittings and connections to the required specifications. over or under tightening can damage threads and create leaks.

ANADOLU ISUZU AFTERSALES

Gasoline

- Protect eyes.
- Protect skin.
- **Always** be alert for the smell of gas.
- **Always** test for fuel leaks as instructed.
- Do **not** dilute.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Vapors accumulate near the floor. Check the work floor, sumps, and low lying areas for ignition sources before servicing equipment..
- Provide extra ventilation to the work area.
- Do **not** troubleshoot or repair fuel leaks while the engine is running.
- If material is spilled, avoid contact and dispersal with runoff, soil, waterways, drains, and sewers. Absorb with sand, clay, or commercial absorbent. Transfer to containers and neutralize the material. Flush spill area with soap and excess water.
- Report spills effecting water source contamination to local authorities immediately.
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.
- **Always** torque fittings and connections to the required specifications. over or under tightening can damage threads and create leaks.

Biodiesel

- Protect eyes.
- Protect skin.
- **Always** test for fuel leaks as instructed.
- Do **not** dilute.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Vapors accumulate near the floor. Check the work floor, sumps, and low lying areas for ignition sources before servicing equipment..
- Provide extra ventilation to the work area.
- Do **not** troubleshoot or repair fuel leaks while the engine is running.
- If material is spilled, avoid contact and dispersal with runoff, soil, waterways, drains, and sewers. Absorb with sand, clay, or commercial absorbent. Transfer to containers and neutralize the material. Flush spill area with soap and excess water.
- Report spills effecting water source contamination to local authorities immediately.
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.
- **Always** torque fittings and connections to the required specifications. over or under tightening can damage threads and create leaks.

Compressed Natural Gas

- Protect eyes.
- Protect skin.
- **Always** be alert for the smell of gas. Compressed natural gas is typically treated with an odor producing chemical for leak detection. Non-refined sources of natural gas (landfill gas, biogas, coal bed gas, wellhead gas, etc.) can **not always** be detected by smell.

ANADOLU ISUZU AFTER SALES

- **Always** test for fuel leaks as instructed. Odorant can fade.
- Upon entering a room or approaching a vehicle where the smell of gas is present, immediately shutoff all engines and ignition sources.
- Natural gas ignites when there is a 5% - 15% mixture in the air. Asphyxiation can occur when concentration reaches 21% or more.
- Do **not** start equipment or nearby equipment until a suspected gas leak is corrected and the area is ventilated.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Work in areas that do **not** share common ventilation with areas containing ignition sources.
- Store and service natural gas fueled equipment in large, well-ventilated areas, or outside.
- Provide extra ventilation to the work area.
- Natural gas accumulates near the ceiling. Check the ceiling of the work area for ignition sources before servicing equipment.
- **Only** disconnect gas lines in a well-ventilated area.
- Do **not** troubleshoot or repair gas leaks while the engine is running.
- Natural gas ignition systems produce high voltage during operation. Do **not** touch ignition wiring or components while the engine is operating. If necessary, use **only** insulated tools.
- Natural gas exhaust systems operate at higher temperatures than similar diesel exhaust systems. Do **not** touch exhaust components. Do **not** route lines or hoses which deteriorate from heat exposure near exhaust components or in the flow path of the exhaust.
- **Always** torque fittings and connections to the required specifications. over or under tightening can damage threads and create leaks.

Liquefied Natural Gas

- Protect eyes.
- Protect skin.
- **Always** be alert for the smell of gas. Liquefied natural gas may **not** have an odor. Non-refined sources of natural gas (landfill gas, biogas, coal bed gas, wellhead gas, etc.) can **not always** be detected by smell.
- **Always** test for fuel leaks as instructed. Odorant can fade.
- Upon entering a room or approaching a vehicle where the smell of gas is present, immediately shutoff all engines and ignition sources.
- Natural gas ignites when there is a 5% - 15% mixture in the air. Asphyxiation can occur when concentration reaches 21% or more.
- Do **not** start equipment or nearby equipment until a suspected gas leak is corrected and the area is ventilated.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Work in areas that do **not** share common ventilation with areas containing ignition sources.
- Store and service natural gas fueled equipment in large, well-ventilated areas, or outside.
- Provide extra ventilation to the work area.

- Natural gas accumulates near the ceiling. Check the ceiling of the work area for ignition sources before servicing equipment.
- **Only** disconnect gas lines in a well-ventilated area.
- Do **not** troubleshoot or repair gas leaks while the engine is running.
- Natural gas ignition systems produce high voltage during operation. Do **not** touch ignition wiring or components while the engine is operating. If necessary, use **only** insulated tools.
- Natural gas exhaust systems operate at higher temperatures than similar diesel exhaust systems. Do **not** touch exhaust components. Do **not** route lines or hoses which deteriorate from heat exposure near exhaust components or in the flow path of the exhaust..
- Liquefied natural gas is stored in vehicle tanks at extremely cold temperatures. If there is a liquefied natural gas spill, evacuate the area immediately and do not attempt to make contact with the liquid.
- **Always** torque fittings and connections to the required specifications. over or under tightening can damage threads and create leaks.
- Vapors accumulate near the floor. Check the work floor, sumps, and low lying areas for ignition sources before servicing equipment.

Liquefied Petroleum Gas

- Protect eyes.
- Protect skin.
- **Always** be alert for the smell of gas. Liquefied petroleum gas is typically treated with an odor producing chemical for leak detection.
- **Always** test for fuel leaks as instructed. Odorant can fade.
- Upon entering a room or approaching a vehicle where the smell of gas is present, immediately shutoff all engines and ignition sources.
- Do **not** start equipment or nearby equipment until a suspected gas leak is corrected and the area is ventilated.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Work in areas that do **not** share common ventilation with areas containing ignition sources.
- Store and service natural gas fueled equipment in large, well-ventilated areas, or outside.
- Provide extra ventilation to the work area.
- Liquefied petroluem gas accumulates near the floor. Check the work floor, sumps, and low lying areas for ignition sources before servicing equipment.
- **Only** disconnect gas lines in a well-ventilated area.
- Do **not** troubleshoot or repair gas leaks while the engine is running.
- Liquefied petroleum gas ignition systems produce high voltage during operation. Do **not** touch ignition wiring or components while the engine is operating. If necessary, use **only** insulated tools.
- Liquefied petroleum gas exhaust systems operate at higher temperatures than similar diesel exhaust systems. Do **not** touch exhaust components. Do **not** route lines or hoses which deteriorate from heat exposure near exhaust components or in the flow path of the exhaust..

- Liquefied natural gas is stored in vehicle tanks at extremely cold temperatures. If there is a liquefied natural gas spill, evacuate the area immediately and do not attempt to make contact with the liquid.
- **Always** torque fittings and connections to the required specifications. over or under tightening can damage threads and create leaks.

Power Generation Applications

Follow these recommended practices when interacting with equipment in generator set applications.

Power generation applications produce high voltage during operation. When servicing a generator set, the following safety precautions **must** be taken.

- Remove any debris from the generator set.
- Keep the floor clean and dry throughout servicing
- Service access doors **must** be secured in the "open" position before working on enclosed generator sets.
- Use insulated or non-conducting tools.
- Prevent accidental or remote starting. Disconnect the starting battery cables. Disconnect the negative (-) terminal first.
- Isolate all auxiliary supplies.
- Switch the generator set control panel "off."
- Place a "Do **Not** Operate" tag on the control panel.
- Lock the generator set circuit breaker in the "Open" position.
- Activate the manual "Emergency Stop" device.
- Do **not** step on the generator set when servicing, entering, or leaving the generator room.

Aftertreatment

Follow these recommended practices when interacting with equipment that utilize aftertreatment systems. For information regarding proper handling of various substances, refer to the manufacturer's safety data sheet.

Diesel Exhaust Fluid

- Avoid breathing vapor or mist.
- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes.
- Protect skin. In case of contact with skin, wash with soap and water.
- Do **not** ingest. If ingested, contact a physician immediately.

Diesel Particulate Filter

- Protect eyes.
- Protect skin.
- Avoid stirring up exhaust particulate dust.
- Avoid inhalation of exhaust particulate dust. Wear a dust mask. If respiratory irritation or discomfort occurs, leave the dusty area. Utilize breathing assistance or oxygen if necessary.
- Elevated concentrations of metals in the form of dust, soot, and contaminants are contained in these filters. Health regulations may exist for the materials found in these filters such as Zinc, Molybdenum, polynuclear aromatic hydrocarbons. Potentially toxic materials found in these filters are oxides of calcium, zinc, phosphorous, silicon, sulfur, and iron.
- Proper disposal of the exhaust dust and filter are required. Dispose of in accordance with local and environmental regulations.
- Diesel particulate filter maintenance **must** be completed by appropriately trained personnel.

Selective Catalytic Reduction (SCR) Catalyst

- Protect eyes.
- Protect skin.
- Avoid stirring up exhaust catalyst dust.
- Avoid inhalation of exhaust catalyst dust. Wear a dust mask. If respiratory irritation or discomfort occurs, leave the dusty area. Utilize breathing assistance or oxygen if necessary.
- Do **not** cut open exhaust catalyst assemblies.
- Proper disposal of the exhaust catalyst is required. Dispose of in accordance with local and environmental regulations.

Oxidation Catalysts

Types of Oxidation Catalysts may include, but are not limited to the following.

- Diesel Oxidation Catalyst (DOC)
- 3-way Oxidation Catalyst

When working with oxidation catalysts, perform the following.

- Protect eyes.
- Protect skin.
- Avoid stirring up exhaust catalyst dust.
- Avoid inhalation of exhaust catalyst dust. Wear a dust mask. If respiratory irritation or discomfort occurs, leave the dusty area. Utilize breathing assistance or oxygen if necessary.
- Do **not** cut open exhaust catalyst assemblies.

Common Substances

Follow these recommended practices when interacting with the following substances. For information regarding proper handling of various substances, refer to the manufacturer's safety data sheet.

Coolant

- Coolant is also referred to as antifreeze.
- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes. Receive medical attention immediately.
- Protect skin. In case of contact with skin, wash with soap and water. Remove contaminated clothing. If injection occurs, it is a medical emergency. Receive medical attention immediately.
- Do **not** ingest. If ingested, drink excess water for dilution and seek medical attention.
- Do **not** pour used antifreeze into containers that have been used to store other chemicals or products, such as oil or gasoline, unless they have been thoroughly cleaned.
- If material is spilled, avoid contact and dispersal with runoff, soil, waterways, drains, and sewers. Provide adequate ventilation to the area. Absorb with sand, clay, or commercial absorbent. Transfer to containers and neutralize the material. Flush spill area with soap and excess water.
- Report spills effecting water source contamination to local authorities immediately.
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.

Liquid Nitrogen

- Work in a well-ventilated area.
- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes. Receive medical attention immediately.
- Protect skin. In case of contact with skin, receive medical attention immediately.
- Wear protective clothing and gloves that insulate.
- Handle items with tongs or wire hooks.
- Avoid prolonged breathing of liquid nitrogen vapors. Utilize breathing assistance or oxygen if necessary.

Lubricating Oil

See Lubricating Oil in the "Hazardous Substances" step.

Refrigerant

- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes. In case of frostbite, use lukewarm water, not hot. Seek medical attention if irritation continues.
- Protect skin. Wear leather or insulated gloves. In case of contact with skin, wash with soap and water. Seek medical attention if irritation continues.
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.
- **Only** disconnect liquid refrigerant lines in a well-ventilated area. liquid refrigerant systems **must** be properly emptied and filled using equipment that prevents the release of refrigerant gas into the atmosphere. Federal law requires capturing and recycling refrigerant in the United States of America.

Solvents

- Follow the manufacturer's instructions for safe handling practices.
- Follow the manufacturer's recommendations for use.
- Some solvents are flammable and toxic..
- Protect eyes. In case of contact with eyes, follow manufacturer's recommendations.
- Protect skin. In case of contact with skin, follow manufacturer's recommendations.
- Dispose of in accordance with manufacturer's recommendations.

Starting Aids (Starting Fluid)

- Do **not** use starting fluid if the intake air heater option is used.
- Do **not** use volatile cold starting aids in underground mine or tunnel operations. The local United States Bureau of Mines inspector can provide more information and instructions.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Work in a well-ventilated area.
- Avoid inhalation.

Hazardous Substances

Hazardous substances are known to some state and federal agencies to be carcinogenic and cause reproductive harm. Hazardous substances that may be encountered during service events are listed below.

Diesel Engine Exhaust

- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes.
- Protect skin. In case of contact with skin, wash with soap and water.
- Avoid inhalation.

Lubricating Oil

- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes.
- Protect skin. In case of contact with skin, wash with soap and water.
- Do **not** ingest. If ingested, contact a physician immediately..
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.
- Do **not** allow water droplets to enter a container of hot oil. A violent reaction can result.

Mercury

- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes.
- Protect skin. In case of contact with skin, wash with soap and water.
- Do **not** ingest. If ingested, contact a physician immediately.
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.

Vanadium Pentoxide

ANADOLU ISUZU AFTER SALES

- Can be found in some selective catalytic reduction (SCR) catalysts.
- Protect eyes. In case of contact with eyes, flush with water for a minimum of 15 minutes.
- Protect skin. In case of contact with skin, wash with soap and water.
- Do **not** ingest. If ingested, contact a physician immediately.
- Avoid inhalation of vapors or airborne particles.
- Proper disposal is required. Dispose of in accordance with local and environmental regulations.

Electrical Components

Follow these recommended practices when interacting with electrical components.

Batteries

- Protect eyes. Wear safety glasses or goggles. In case of battery acid contact with eyes, flush with water for a minimum of 15 minutes. Receive medical attention immediately.
- Protect skin. Wear rubber gloves and a chemical apron. In case of battery acid contact with skin or clothing, rinse with water for several minutes. Avoid spreading the acid. Receive medical attention immediately.
- Do **not** open the battery caps with your face over or near the battery.
- Remove rings, watches, long jewelry, or metallic items when working with or near batteries.
- Ventilate the battery compartment before servicing the battery.
- Work in a well-ventilated area.
- Avoid sparks, arcing switches and equipment, cigarettes, pilot lights, flames, and other sources of ignition.
- Use insulated or non-conducting tools.
- Neutralize static buildup by contacting the nearest ground surface before working on a battery.
- Do **not** lift batteries by the posts.
- Do **not** touch both battery terminals with your bare hands at the same time.
- Disconnect the negative (-) battery cable first.
- Attach the negative (-) battery cable last.

Common Hazards

Follow these recommended practices when interacting with equipment as the following hazards may exist.

High Temperature Area

Be alert for high temperature areas which may cause severe burns. High temperature areas may be encountered in the following situations.

- On products that have just been turned off.
- On or around exhaust related components (turbocharger, aftertreatment systems, etc).
- In exhaust gas flow paths.
- Contacting hot fluid lines, tubes, or compartments.

Recommended Practices:

- Allow components to cool before servicing. Verify the temperature of the component. Utilize an infrared gun, temperature sensor, temperature gauge, or other reliable method to determine component temperature. Take appropriate precautions before starting work.
- Protect eyes.
- Protect skin. Wear insulated gloves.
- Ensure surrounding items do not come in contact with hot components or exhaust. Contact may ignite or melt those materials.

Heavy Objects

Be alert when working with heavy objects.

- Do **not** lift components that weigh 23 kg [50 lb] or more. Use mechanical help or seek assistance.
- Use mechanical help to move items whenever possible. Make sure the load is securely fastened to the equipment.
- Make sure lifting devices, like chains, hooks, slings, etc., are in good condition and are rated for the correct capacity before use.
- Make sure lifting devices are positioned correctly before use.
- Use a spreader bar when necessary.
- If the item can be lifted manually, squat to lift and lower the item. Do **not** bend at the waist.
- Maintain balance when lifting items by keeping feet apart or staggered if possible.
- If the item must be carried, make sure the path is clear when carrying the item to, and placing the item in, the desired location.

Pressurized Areas

Be alert for pressurized areas. Pressurized areas may be encountered in the following situations.

- Air, Oil, Fuel, and Cooling systems.
- When disconnecting or removing lines, fittings, or related items.
- When disconnecting a device from a pressurized system.
- When removing or loosening caps on tanks or pressurized systems.

Injuries that may result when interacting with pressurized areas are listed below.

- High pressure spray can penetrate the skin. Serious injury or death may result.
- Hot fluid spray can cause burns. See "High Temperature Area."

Recommended Practices:

- Protect skin. Wear impervious gloves. If skin penetration from high pressure spray occurs, it is a medical emergency. Receive medical attention immediately.
- Check for pressure leaks as instructed. **Never** check for pressure leaks with your hand.
- Allow product to cool before accessing pressurized areas.
- Relieve system pressure as instructed.
- Slowly loosen fill caps to relieve pressure before servicing.

Job Safety Assessment

Completing a Job Safety Assessment (JSA) prior to performing work helps identify job safety hazards and prevent incidents. Use the guidelines below to assess if a situation is safe or at risk prior to performing designated work. If deteremined to be at risk, take appropriate precautions to prepare for, or eliminate, the hazard. If the risks are uncontrollable, consult a knowledgeable resource to find a safe practice solution. A knowledgeable resource may include, but is not limited to, one of the following:

- Site supervisor
- Customer
- Work supervisor

Always check with the site where work is being performed to determine if safety assessment documentation is required.

Work Practices

Job Safety Analysis.

- Assess the job to identify safety hazards that may occur during the repair event.

Ascending or Descending

- Maintain 3 points of contact when using steps, ladders, or entering and exiting a unit.

Communication

- When working with others, make sure you understand what each other is doing to safely complete the task.

Eyes On Hands and Work.

- Confirm if you will be able to maintain an unobstructed view of your hands at all times while performing the task.

Eyes On Path

- Watch for hazards in your path to avoid trip or slip hazards. Examples are pits, platform edges, etc.

Line Of Fire

ANADOLU ISUZU AFTER SALES

- Position yourself so that you avoid striking against, or being struck by, anything that can swing, fall, or roll.

Pinch Point

- Prevent exposure of all parts of your body to a nip hazard or pinch point.

Rushing

- Take adequate time to safely perform the job. Do **not** rush or take short cuts.

Follow Procedures

- Utilize QuickServe® Online or other standard procedures when available.
- Make sure the procedures are correct and safe.

Ergonomics

Back-Bending and Twisting

- Avoid bending forward more than 45 at your waist.
- Avoid working with your back twisted with loads over 23 kg [50 lb].

Knee

- Avoid bending your knee more than 90.
- Avoid kneeling for more than 4 hours per day.

Lifting and Lowering

- Squat to pick up parts.
- Keep loads close to the body when lifting or carrying.
- Use a team lift or a lifting device if the object is more than 23 kg [50 lb].

Pulling or Pushing

- Pull with your arms.
- Push with your legs.
- Avoid exerting more force than necessary.
- Avoid moving heavy load(s) too quickly.

Tools and Equipment

Selection

- Select the correct tool or equipment to perform the task.

Condition

- Confirm the tool or equipment is free of defects before use.
- Confirm that safety devices are in place before use.

Use

- Use the tool or equipment as directed.
- Follow the manufacturer's instructions.

Personal Protective Equipment (PPE)

Eye, Face, and Head Protection

ANADOLU ISUZU
AFTER SALES

- Confirm the eye, face, or head protection you plan to use are adequate for performing the task at hand.

Foot Protection

- Confirm the foot protection you plan to use is adequate for performing the task at hand in the current environment.

Fall Protection

- Fall protection should be used if you are working more than 1.2 m [4 ft] above the floor.
- Use fall protection if you have been properly trained to do so. If you are not trained to use fall protection, allow someone who has received proper training to perform the task.

Hand Protection

- Avoid exposing hands to cuts or burns while completing the task.
- Confirm the proper glove type is being used for the task at hand. Examples are cut-resistant, chemical-resistant, electric shock-resistant, electric arc flash, welding, etc.

Hearing Protection

- Hearing protection should be worn when required or recommended.

Body Protection

- Body parts should be protected from work hazards.
- Avoid contact with sharp edges, hot surfaces, etc.

Work Procedures

Training

- Confirm if you have received task and safety training for the job being performed.

Working Alone

- Avoid working alone.
- Avoid working where you are **not** able to be seen or heard by another person.
- If you **must** work alone, notify others of your location and schedule check-in times.

Lockout and Tagout

- Lock out or tag out energy sources before work. Examples are electrical, mechanical, hydraulic, and pneumatic.

Barricades and Warnings

- Mark overhead work areas with barricade tape or signs.
- Mark open floor hazards with barricade tape, signs, or cones.

Confined Space

- Confirm if a confined space entry permit is required.
- If required, confirm the permit is posted, signed, and dated correctly.

Hot Work

- Confirm a functional fire extinguisher is readily available.
- Maintain separation between ignition sources and fuel sources.

ANADOLU ISUZU AFTER SALES

Place Wheel Chocks

- Place wheel chocks at either the front or back tire of the unit prior to starting the task.

Spotter

- Use a spotter when moving a customer's unit.
- Confirm the driver can see and hear the spotter when moving.

Housekeeping (The 5 S's - Scrap or Segregate, Set to Order, Spotless, Standardize, and Sustain)

- Remove parts, extension cords, air hoses, and liquids from the work area that may cause trip, slip, or fall hazards.

Last Modified: 28-Nov-2017

ANADOLU ISUZU AFTER SALES

General Information

This system incorporates the latest technology at the time it was manufactured; yet, it is designed to be repaired using normal repair practices performed to quality standards.

⚠ WARNING ⚠

Cummins Inc. does not recommend or authorize any modifications or repairs to components except for those detailed in Cummins Service Information. In particular, unauthorized repair to safety-related components can cause personal injury or death. Below is a partial listing of components classified as safety-related:

1. Air Compressor
2. Air Controls
3. Air Shutoff Assemblies
4. Balance Weights
5. Cooling Fan
6. Fan Hub Assembly
7. Fan Mounting Bracket(s)
8. Fan Mounting Capscrews
9. Fan Hub Spindle
10. Flywheel
11. Flywheel Crankshaft Adapter
12. Flywheel Mounting Capscrews
13. Fuel Shutoff Assemblies
14. Fuel Supply Tubes
15. Lifting Brackets
16. Throttle Controls
17. Turbocharger Compressor Casing
18. Turbocharger Oil Drain Line(s)
19. Turbocharger Oil Supply Line(s)
20. Turbocharger Turbine Casing
21. Vibration Damper Mounting Capscrews
22. Manual Service Disconnect
23. High Voltage Interlock Loop
24. High Voltage Connectors/Connections and Harnesses
25. High Voltage Battery System
26. Power Inverter
27. Generator Motor
28. Clutch Pressure Plate

- Follow all safety instructions noted in the procedures

AYHAN OLU ISUZU AFTER SALES

- Follow the manufacturer's recommendations for cleaning solvents and other substances used during repairs. Some solvents have been identified by government agencies as toxic or carcinogenic. Avoid excessive breathing, ingestion and contact with such substances. **Always** use good safety practices with tools and equipment
- Provide a clean environment and follow the cleaning instructions specified in the procedures
- All components **must** be kept clean during any repair. Contamination of the components will cause premature wear.
- Perform the inspections specified in the procedures
- Replace all components or assemblies which are damaged or worn beyond the specifications
- Use genuine Cummins new or ReCon® service parts and assemblies
- The assembly instructions have been written to use again as many components and assemblies as possible. When it is necessary to replace a component or assembly, the procedure is based on the use of new Cummins or Cummins ReCon® components. All of the repair services described in this manual are available from all Cummins Distributors and most Dealer locations.
- Follow the specified disassembly and assembly procedures to reduce the possibility of damage to the components

Welding on a Vehicle with an Electronic Controlled Fuel System

⚠ CAUTION ⚠

Disconnect both the positive (+) and negative (-) battery cables from the battery before welding on the vehicle. Attach the welder ground cable no more than 0.61 meters [2 feet] from the part being welded. Do not connect the ground clamp of the welder to any of the sensors, wiring harness, electronic control units or the components. Direct welding of any electronic components must not be attempted. Sensors, wiring harness, and electronic control unit should be removed if nearby welding will expose these components to temperatures beyond normal operation. Additionally, all electronic control unit connectors must be disconnected

ARDOLU ISUZU SERVICES

Last Modified: 10-Jul-2012

Definition of Clean

Parts **must** be free of debris that can contaminate any engine system. This does **not** necessarily mean they have to appear as new.

Sanding gasket surfaces until the factory machining marks are disturbed adds no value and is often harmful to forming a seal. It is important to maintain surface finish and flatness tolerances to form a quality sealing surface. Gaskets are designed to fill small voids in the specified surface finish.

Sanding gasket surfaces where edge-molded gaskets are used is most often unnecessary. Edge-molded gaskets are those metal carriers with sealing material bonded to the edges of the gasket to seal while the metal portion forms a metal to metal joint for stability. Any of the small amounts of sealing material that can stick to the parts are better removed with a blunt-edged scraper on the spots rather than spending time polishing the whole surface with an air sander or disc.

For those gaskets that do **not** have the edge molding, nearly all have a material that contains release agents to prevent sticking. Certainly this is **not** to say that some gaskets are **not** difficult to remove because the gasket has been in place a long time, has been overheated or the purpose of the release agent has been defeated by the application of some sealant. The object however is just to remove the gasket without damaging the surfaces of the mating parts without contaminating the engine (don't let the little bits fall where they can not be removed).

Bead blasting piston crowns until the dark stain is removed is unnecessary. All that is required is to remove the carbon build-up above the top ring and in the ring grooves. There is more information on bead blasting and piston cleaning later in this document.

Cummins Inc. does **not** recommend sanding or grinding the carbon ring at the top of cylinder liners until clean metal is visible. The liner will be ruined and any signs of a problem at the top ring reversal point (like a dust-out) will be destroyed. It is necessary to remove the carbon ring to provide for easier removal of the piston assembly. A medium bristle, high quality, steel wire wheel that is rated above the rpm of the power tool being used will be just as quick and there will be less damage. Yes, one **must** look carefully for broken wires after the piston is removed but the wires are more visible and can be attracted by a magnet.

Oil on parts that have been removed from the engine will attract dirt in the air. The dirt will adhere to the oil. If possible, leave the old oil on the part until it is ready to be cleaned, inspected and installed, and then clean it off along with any attracted dirt. If the part is cleaned then left exposed it can have to be cleaned again before installation. Make sure parts are lubricated with clean oil before installation. They do **not** need to be oiled all over but do need oil between moving parts (or a good lube system priming process conducted before cranking the engine).

Bead blasting parts to remove exterior paint is also usually unnecessary. The part will most likely be painted again so all that needs happen is remove any loose paint.

Abrasive Pads and Abrasive Paper

The keyword here is "abrasive". There is no part of an engine designed to withstand abrasion. That is they are all supposed to lock together or slide across each other. Abrasives and dirt particles will degrade both functions.

⚠ WARNING ⚠

Abrasive material must be kept out of or removed from oil passages and parts wear points. Abrasive material in oil passages can cause bearing and bushing failures that can progress to major component damage beyond reuse. This is particularly true of main and rod bearings.

Cummins Inc. does **not** recommend the use of emery cloth or sand paper on any part of an **assembled** engine or component including but **not** limited to removing the carbon ridge from cylinder liners or to clean block decks or counterbores.

Great care **must** be taken when using abrasive products to clean engine parts, particularly on partially assembled engines. Abrasive cleaning products come in many forms and sizes. All of them contain aluminum oxide particles, silicon carbide, or sand or some other similar hard material. These particles are harder than most of the parts in the engine. Since they are harder, if they are pressed against softer material they will either damage the material or become embedded in it. These materials fall off the holding media as the product is used. If the products are used with power equipment the particles are thrown about the engine. If the particles fall between two moving parts, damage to the moving parts is likely.

If particles that are smaller than the clearance between the parts while they are at rest (engine stopped), but larger than the running clearance then damage will occur when the parts move relative to each other (engine started). While the engine is running and there is oil pressure, particles that are smaller than the bearing clearance are likely to pass between the parts without damage and be trapped in the oil filter. However, particles larger than the bearing clearance will remove material from one part and can become embedded in one of the parts. Once embedded in one part it will abrade the other part until contact is no longer being made between the two parts. If the damage sufficiently degrades the oil film, the two parts will come into contact resulting in early wear-out or failure from lack of effective lubrication.

Abrasive particles can fly about during cleaning it is **very** important to block these particles from entering the engine as much as possible. This is particularly true of lubricating oil ports and oil drilling holes, especially those located downstream of the lubricating oil filters. Plug the holes instead of trying to blow the abrasive particles and debris with compressed air because the debris is often simply blown further into the oil drilling.

All old gasket material **must** be removed from the parts gasket surfaces. However, it is **not** necessary to clean and polish the gasket surface until the machining marks are erased. Excessive sanding or buffing can damage the gasket surface. Many newer gaskets are of the edge molded type (a steel carrier with a sealing member bonded to the steel). What little

sealing material that can adhere is best removed with a blunt-edged scraper or putty knife. Cleaning gasket surfaces where an edge-molded gasket is used with abrasive pads or paper is usually a waste of time.

⚠ WARNING ⚠

Excessive sanding or grinding the carbon ring from the top of the cylinder liners can damage the liner beyond reuse. The surface finish will be damaged and abrasive particles can be forced into the liner material which can cause early cylinder wear-out or piston ring failures.

Tape off or plug all openings to any component interior before using abrasive pads or wire brushes. If really necessary because of time to use a power tool with abrasive pads, tape the oil drillings closed or use plug and clean as much of the surface as possible with the tool but clean around the oil hole/opening by hand so as to prevent contamination of the drilling. Then remove the tape or plug and clean the remaining area carefully and without the tool. DO NOT use compressed air to blow the debris out of oil drilling on an assembled engine! More likely than **not**, the debris can be blown further into the drilling. Using compressed air is fine if both ends of the drilling are open but that is rarely the case when dealing with an assembled engine.

Gasket Surfaces

The object of cleaning gasket surfaces is to remove any gasket material, not refinish the gasket surface of the part.

Cummins Inc. does **not** recommend any specific brand of liquid gasket remover. If a liquid gasket remover is used, check the directions to make sure the material being cleaned will **not** be harmed.

Air powered gasket scrapers can save time but care must be taken to **not** damage the surface. The angled part of the scraper must be against the gasket surface to prevent the blade from digging into the surface. Using air powered gasket scrapers on parts made of soft materials takes skill and care to prevent damage.

Do **not** scrape or brush across the gasket surface if at all possible.

Solvent and Acid Cleaning

Several solvent and acid-type cleaners can be used to clean the disassembled engine parts (other than pistons. See Below). Experience has shown that the best results can be obtained using a cleaner that can be heated to 90° to 95° Celsius (180° to 200° Fahrenheit). Kerosene

emulsion based cleaners have different temperature specifications, see below. A cleaning tank that provides a constant mixing and filtering of the cleaning solution will give the best results. Cummins Inc. does not recommend any specific cleaners. Always follow the cleaner manufacturer's instructions. Remove all the gasket material, o-rings, and the deposits of sludge, carbon, etc., with a wire brush or scraper before putting the parts in a cleaning tank. Be careful not to damage any gasket surfaces. When possible, steam clean the parts before putting them in the cleaning tank.

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturers recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

Experience has shown that kerosene emulsion based cleaners perform the best to clean pistons. These cleaners should **not** be heated to temperature in excess of 77°C (170°F). The solution begins to break down at temperatures in excess of 82°C (180°F) and will be less effective.

Do **not** use solutions composed mainly of chlorinated hydrocarbons with cresols, phenols and/or cresylic components. They often do **not** do a good job of removing deposits from the ring groove and are costly to dispose of properly.

Solutions with a pH above approximately 9.5 will cause aluminum to turn black; therefore do **not** use high alkaline solutions.

Chemicals with a pH above 7.0 are considered alkaline and those below 7.0 are acidic. As you move further away from the neutral 7.0, the chemicals become highly alkaline or highly acidic.

Remove all the gasket material, o-rings, and the deposits of sludge, carbon, etc., with a wire brush or scraper before putting the parts in a cleaning tank. Be careful to **not** damage any gasket surfaces. When possible use hot high pressure water or steam clean the parts before putting them in the cleaning tank. Removing the heaviest dirt before placing in the tank will allow the cleaner to work more effectively and the cleaning agent will last longer.

Rinse all the parts in hot water after cleaning. Dry completely with compressed air. Blow the rinse water from all the capscrew holes and the oil drillings.

If the parts are **not** to be used immediately after cleaning, dip them in a suitable rust proofing compound. The rust proofing compound **must** be removed from the parts before assembly or installation on the engine.

Steam Cleaning

Steam cleaning can be used to remove all types of dirt that can contaminate the cleaning tank. It is a good method for cleaning the oil drillings and coolant passages

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

Do **not** steam clean the following components:

- Electrical Components
- Wiring Harnesses
- Belts and Hoses
- Bearings (ball or taper roller)
- Electronic Control Module (ECM)
- ECM Connectors
- Capacitive Coil Driver Module (CCD)
- Ignition Coils and Leads
- NOx Sensor
- Fuel Control Valve
- Throttle Driver and Actuator.

Plastic Bead Cleaning

Cummins Inc. does **not** recommend the use of glass bead blast or walnut shell media on **any** engine part. Cummins Inc. recommends using **only** plastic bead media, Part Number 3822735 or equivalent on any engine part. **Never** use sand as a blast media to clean engine parts. Glass and walnut shell media when **not** used to the media manufacturer's recommendations can cause excess dust and can embed in engine parts that can result in premature failure of components through abrasive wear.

Plastic bead cleaning can be used on many engine components to remove carbon deposits. The cleaning process is controlled by the use of plastic beads, the operating pressure and cleaning time.

⚠ CAUTION ⚠

Do not use bead blasting cleaning methods on aluminum pistons skirts or the pin bores in any piston, piston skirt or piston crown. Small particles of the media will embed in the aluminum or other soft metal and result in premature wear of the cylinder liner, piston rings, pins and pin bores. Valves, turbocharger shafts, etc., can also be damaged. Follow the cleaning directions listed in the procedures.

⚠ CAUTION ⚠

Do not contaminate wash tanks and tank type solvent cleaners with the foreign material and plastic beads. Remove the foreign material and plastic beads with compressed air, hot high pressure water or steam before placing them in tanks or

cleaners. The foreign material and plastic beads can contaminate the tank and any other engine parts cleaned in the tank. Contaminated parts may cause failures from abrasive wear.

Plastic bead blasting media, Part Number 3822735, can be used to clean all piston ring grooves. Do **not** sure any bead blasting media on piston pin bores or aluminum skirts.

Follow the equipment manufacturer's cleaning instructions. Make sure to adjust the air pressure in the blasting machine to the bead manufacturer's recommendations. Turning up the pressure can move material on the part and cause the plastic bead media to wear out more quickly. The following guidelines can be used to adapt to manufacturer's instructions:

1. Bead size: U.S. size Number 16 — 20 for piston cleaning with plastic bead media, Part Number 3822735
2. Operating Pressure — 270 kPa (40 psi) for piston cleaning. Pressure should not cause beads to break.
3. Steam clean or wash the parts with solvent to remove all of the foreign material and plastic beads after cleaning. Rinse with hot water. Dry with compressed air.

⚠ CAUTION ⚠

The bead blasting operation must not disturb the metal surface. If the metal surface is disturbed the engine can be damaged due to increased parts clearance or inadequate surface finish on parts that move against other parts.

When cleaning pistons, it is **not** necessary to remove all the dark stain from the piston. All that is necessary is to remove the carbon on the rim and in the ring grooves. This is best done by directing the blast across the part as opposed to straight at the part. If the machining marks are disturbed by the blasting process, then the pressure is too high or the blast is being held on one spot too long. The blast operation **must not** disturb the metal surface.

Walnut shell bead blast material is sometimes used to clean ferrous metals (iron and steel). Walnut shell blasting produces a great amount of dust particularly when the pressure if the air pressure on the blasting machine is increased above media manufacturer's recommendation. Cummins Inc. recommends **not** using walnut shell media to clean engine parts due to the risk media embedment and subsequent contamination of the engine.

Cummins Inc. now recommends glass bead media **NOT** used to clean any engine parts. Glass media is too easily embedded into the material particularly in soft materials and when air pressures greater than media manufacturer's recommend are used. The glass is an abrasive so when it is in a moving part, that part is abrading all the parts in contact with it. When higher pressures are used the media is broken and forms a dust of a very small size that floats easily in the air. This dust is very hard to control in the shop, particularly if **only** compressed air (and not hot water) is used to blow the media after it is removed from the blasting cabinet (blowing the part off inside the cabinet may remove large accumulations but never removes all the media).

Bead blasting is best used on stubborn dirt/carbon build-up that has **not** been removed by first steam/higher pressure washing then washing in a heated wash tank. This is particularly true of pistons. Steam and soak the pistons first then use the plastic bead method to safely

remove the carbon remaining in the grooves (instead of running the risk of damaging the surface finish of the groove with a wire wheel or end of a broken piston ring. Make sure the parts are dry and oil free before bead blasting to prevent clogging the return on the blasting machine.

Always direct the bead blaster nozzle "across" rather than directly at the part. This allows the bead to get under the unwanted material. Keep the nozzle moving rather than hold on one place. Keeping the nozzle directed at one-place too long causes the metal to heat up and be moved around. Remember that the spray is **not** just hitting the dirt or carbon. If the machining marks on the piston groove or rim have been disturbed then there has **not** been enough movement of the nozzle and/or the air pressure is too high.

Never bead blast valve stems. Tape or use a sleeve to protect the stems during bead blasting. Direct the nozzle across the seat surface and radius rather than straight at them. The object is to remove any carbon build up and continuing to blast to remove the stain is a waste of time.

Fuel System

When servicing any fuel system components, which can be exposed to potential contaminants, prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. If the surrounding areas are **not** cleaned, dirt or contaminants can be introduced into the fuel system.

The internal drillings of some injectors are extremely small and susceptible to plugging from contamination. Some fuel injection systems can operate at very high pressures. High pressure fuel can convert simple particles of dirt and rust into a highly abrasive contaminant that can damage the high pressure pumping components and fuel injectors.

Electrical contact cleaner can be used if steam cleaning tools are **not** available. Use electrical contact cleaner rather than compressed air, to wash dirt and debris away from fuel system fittings. Diesel fuel on exposed fuel system parts attracts airborne contaminants.

Choose lint free towels for fuel system work.

Cap and plug fuel lines, fittings, and ports whenever the fuel system is opened. Rust, dirt, and paint can enter the fuel system whenever a fuel line or other component is loosened or removed from the engine. In many instances, a good practice is to loosen a line or fitting to break the rust and paint loose, and then clean off the loosened material.

When removing fuel lines or fittings from a new or newly-painted engine, make sure to remove loose paint flakes/chips that can be created when a wrench contacts painted line nuts or fittings, or when quick disconnect fittings are removed.

Fuel filters are rated in microns. The word micron is the abbreviation for a micrometer, or one millionth of a meter. The micron rating is the size of the smallest particles that will be captured by the filter media. As a reference, a human hair is 76 microns [0.003 in] in diameter. One micron measures 0.001 mm [0.00004 in.]. The contaminants being filtered out are smaller than can be seen with the human eye, a magnifying glass, or a low powered microscope.

The tools used for fuel system troubleshooting and repair are to be cleaned regularly to avoid contamination. Like fuel system parts, tools that are coated with oil or fuel attract airborne contaminants. Remember the following points regarding your fuel system tools:

- Fuel system tools are to be kept as clean as possible.
- Clean and dry the tools before returning them to the tool box.
- If possible, store fuel system tools in sealed containers.
- Make sure fuel system tools are clean before use.

ANADOLU ISUZU AFTER SALES

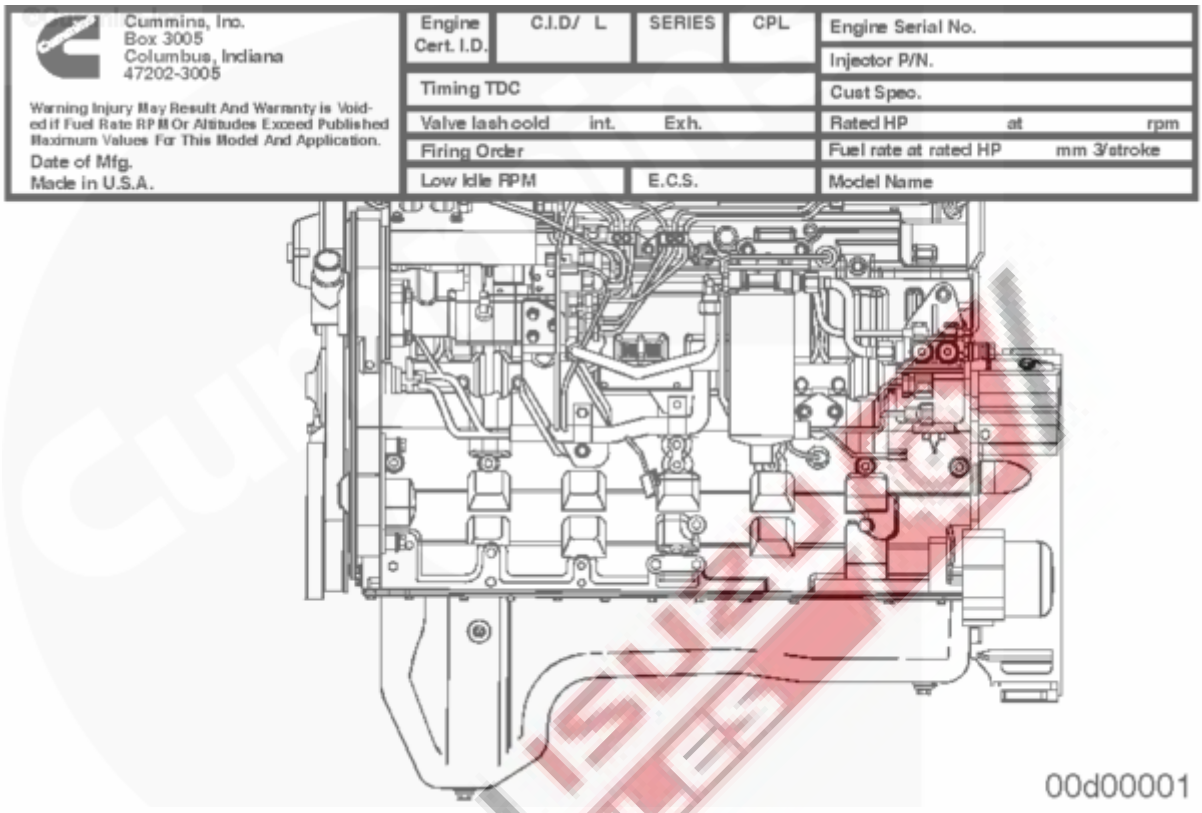
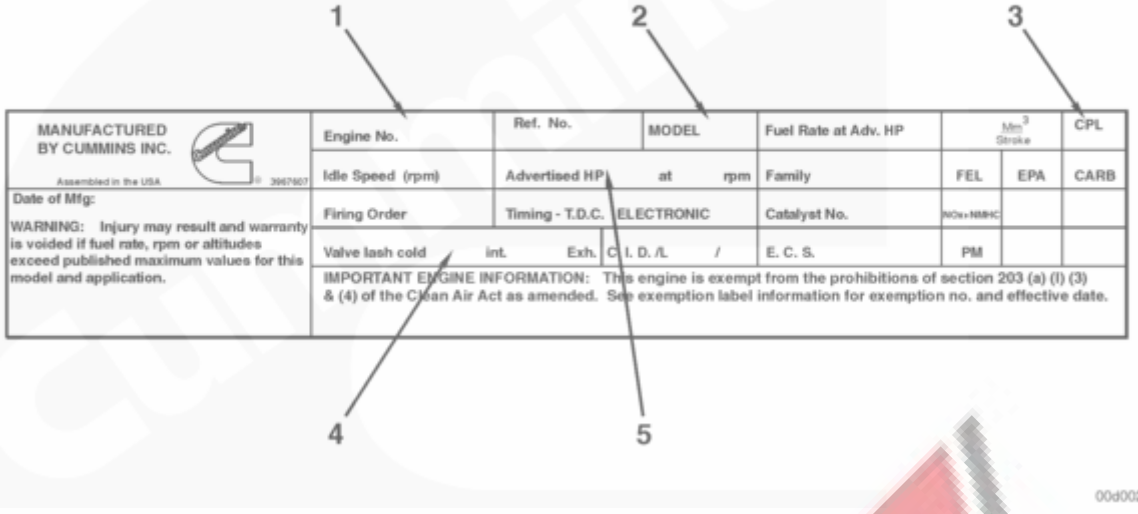
Engine Dataplate



The engine dataplate provides important information about the engine. The engine serial number (ESN) and control part list (CPL) provide information for service and for ordering parts. The engine dataplate **must not** be changed unless approved by Cummins Inc.

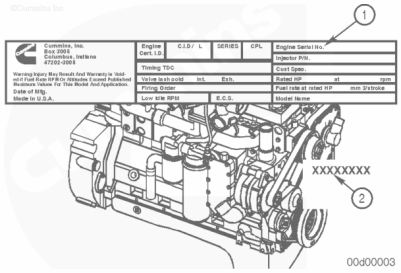
Have the following engine data available when communicating with a Cummins® Authorized Repair Location. The information on the dataplate is **mandatory** when sourcing service parts.



1. Engine serial number (ESN)
2. Engine model information
3. Control parts list (CPL)
4. Valve lash (overhead) setting
5. Horsepower and rpm rating.

Note : Depending on the manufacturing plant, calibration data can also be found on the engine dataplate.

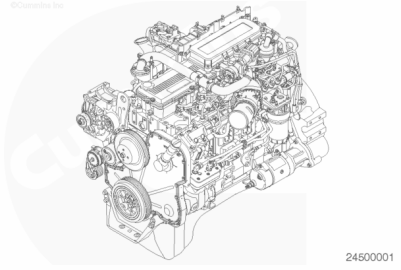
If the engine dataplate (1) is **not** legible, the ESN (2) can be found on the engine block, on top of the lubricating oil cooler housing. Additional engine information is on the engine control module (ECM) dataplate.



Cummins® Engine Nomenclature

The Cummins® Service Engine Model Identification procedure describes how to use the Cummins® Service Model Name to identify an engine. Refer to Procedure 100-008 in Section E. (/qs3/pubsys2/xml/en/procedures/99/99-100-008.html)

The Cummins® Product Technology procedure provides the Cummins® Service Model Name and describes the unique technology used by the engine covered by this manual.

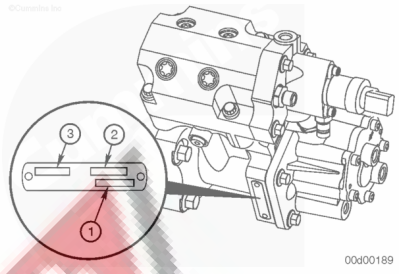


Refer to Procedure 100-006 in section E.
(/qs3/pubsys2/xml/en/procedures/425/425-100-006.html)

Fuel Pump Dataplate

The fuel pump dataplate is located on the side of the high-pressure pump. The dataplate contains the following information:

1. Cummins® part number
2. Pump serial number
3. Factory code.

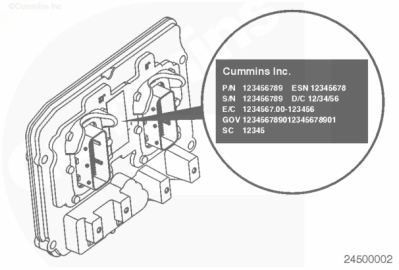


Engine Control Module Dataplate

The ECM dataplate is located on the front of the ECM.

The following information is found on the ECM dataplate:

- ECM part number (PN)
- ECM serial number (SN)
- ECM date code (DC)
- Engine serial number (ESN)
- ECM Code: identifies the software in the ECM).



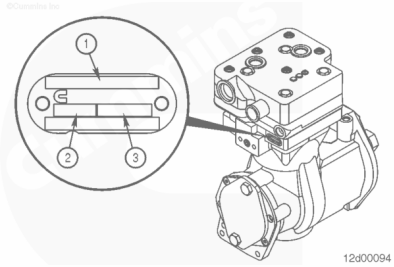
Note : The presence of an ECM dataplate depends on the manufacturing plant and the date the engine was manufactured. If an ECM dataplate was **not** installed by the manufacturing plant, calibration data can be found on the engine dataplate.

Note : Not all engines will have ECM dataplates.

Engines covered by this manual are equipped with a CM2350 ECM. A CM2350 engine control module has two 96 pin connectors.

Air Compressor

Note : Not all engines are equipped with an air compressor.

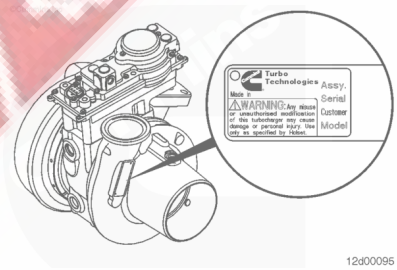


The Cummins® branded air compressor dataplate, identified by the Cummins Inc. logo on the dataplate, is typically located on the rear side of the air compressor. The dataplate contains the following information that assists in service or replacement.

1. Cummins® part number
2. Date code
3. Serial number.

Variable Geometry Turbocharger

The variable geometry turbocharger dataplate is located on the turbocharger inlet compressor housing. The dataplate contains the following information which will assist in service or replacement.

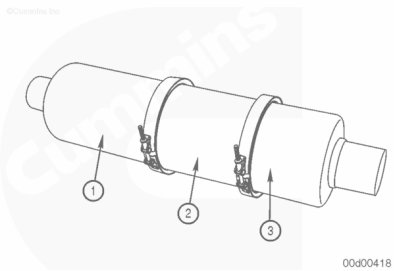


- Cummins® assembly part number
- Serial number
- Customer number
- Model number.

Note : The electronic actuator on the variable geometry turbocharger is a serviceable component and has a separate dataplate that assists in service or replacement.

Exhaust System

The diesel particulate aftertreatment assembly has important information for service and replacement stamped into the canister.



There are three important stamping locations on the aftertreatment assembly:

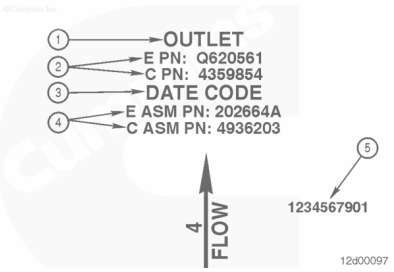
1. Aftertreatment diesel oxidation inlet/catalyst part number and serial number, located on the inlet/catalyst section
2. Aftertreatment diesel particulate filter part number and serial number, located on the filter section.

ANADOLU ISUZU AFTERSALES

3. Aftertreatment assembly outlet section part number, located on the outlet of the aftertreatment system.

A typical aftertreatment information stamping can provide the following:

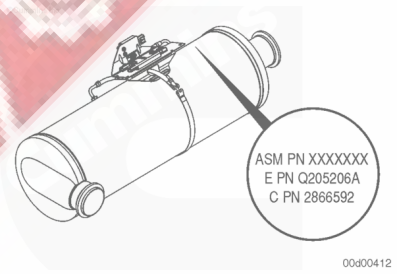
1. Section name
2. Part number
3. Date code
4. Assembly number (**only** located on the outlet section)
5. Serial number.



Note : Some aftertreatment components could possibly **only** have the Cummins Emission Solutions™ part number for cross referencing and part number identification. See QuickServe® Online.

The aftertreatment selective catalytic reduction catalyst identification is located on the side of the part and contains the following information to assist in service or replacement:

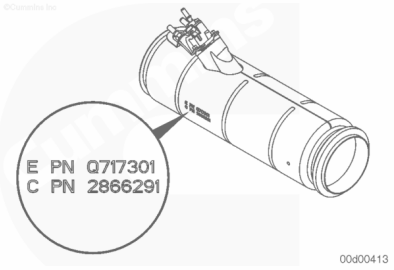
- Assembly part number
- Cummins Emission Solutions™ part number
- Cummins® part number.



Note : Some aftertreatment components could possibly **only** have the Cummins Emission Solutions™ part number for cross referencing and part number identification. See QuickServe® Online.

The aftertreatment decomposition tube identification is located on the side of the part and contains the following information to assist in service or replacement:

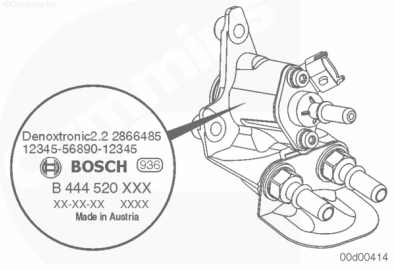
- Cummins Emission Solutions™ part number
- Cummins® part number.



Note : Some aftertreatment components may **only** have the Cummins Emission Solutions™ part number for cross referencing and part number identification. See QuickServe® Online.

The aftertreament diesel exhaust fluid dosing valve identification is located on the side of the valve and contains the following information to assist in service or replacement:

- Cummins® part number
- Cummins Emission Solutions™ part number
- Bosch™ part number
- Bosch™ production data (date code and serial number).

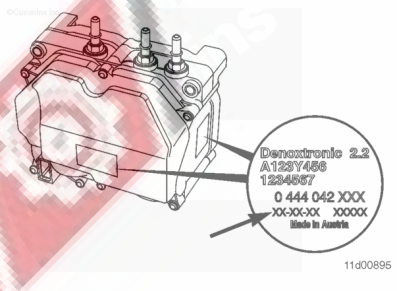


Example:

- 2866485 is the Cummins® part number
- 12345-67890-12345 is the Cummins Emission Solutions™ part number
- B 444 606 XXX is the Bosch™ part number
- XX-XX-XX is the date code
- XXXX is the serial number.

Note : Some aftertreatment components may **only** have the Cummins Emission Solutions™ part number for cross referencing and part number identification. See QuickServe® Online.

The aftertreament diesel exhaust fluid dosing unit identification is located on the side of the part and contains the following information to assist in servicing or replacement:



11d00895

- Cummins Emission Solutions™ part number
- Cummins® part number
- Bosch™ part number
- Bosch™ production data (date code and serial number).

Example:

- A123Y456 is the Cummins Emission Solutions™ part number
- 1234567 is the Cummins® part number
- 0 444 042 XXX is the Bosch™ part number
- XX-XX-XX is the date code
- XXXXX is the serial number.

Note : Some aftertreatment components may **only** have the Cummins Emission Solutions™ part number for cross referencing and part number identification. See QuickServe® Online.

ANADOLU ISUZU PARTS SALES

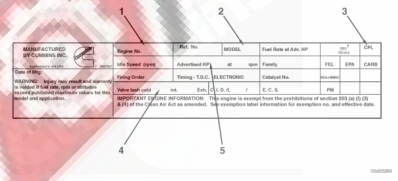
Last Modified: 10-Oct-2016

General Information

The Cummins® Service Engine Model Identification procedure describes:

- The purpose of the Cummins® Service Model Name.
- How to interpret a Cummins® Service Model Name to identify a Cummins® Engine.

The Cummins® Service Model Name differs from the Cummins® marketing model name. Service model names are more specific and help to match the correct Cummins® service information to the correct engine. Marketing engine model names are more generic and can capture multiple engine variations in the same model name.



Marketing Engine Model Name	Service Model Name
B6.7	B6.7 CM2350 B121B

Marketing engine model names (2) can be found on the engine dataplate, Cummins® brochures, and Cummins® promotional literature.

Examples of Cummins® service information and products that use service model names:

- QuickServe™ Online
- INSITE™ electronic service tool
- Owner's Manual
- Operation and Maintenance Manual
- Master Repair Manual
- Service Manual
- Wiring Diagram
- Fault Code Troubleshooting Manual
- Standard Repair Times
- Technical Service Bulletins
- Service Bulletins

The Cummins® Service Model Name begins with the marketing engine model name.

The first two letters of the marketing model may still contain an “IS” or “QS” if the engine is an electronic engine.

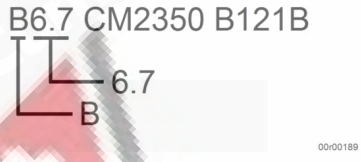
“IS” prefix designates an on-highway engine.

“QS” prefix designates an off-highway engine.

The first letter is the engine platform/series designation followed by the engine liter displacement. For the example shown in the graphic, the engine is a:

B Series engine.

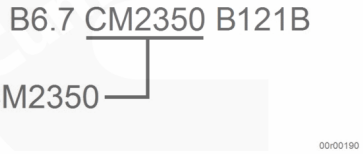
6.7 Liters in Displacement.



If no letter is located after the engine liter displacement information, the engine is fueled by diesel.

If the letter “N” is located after the engine liter displacement information, the engine is fueled by natural gas.

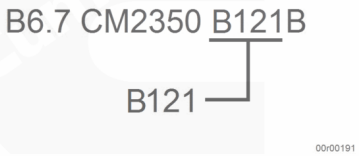
The engine control system is identified with the letters "CM" followed by the control system model number.



The identifier after the control system is a letter and number combination to identify variations between products.

The letter is the engine platform designation.

The number increments as new variations of the engine are released. The first number is 101.



The letter at the end of the suffix identifies the general application for which the product is intended to be used.

- B – Automotive
- C – Industrial

- G – Power Generation/Generator Drive
- M – Marine

General Information

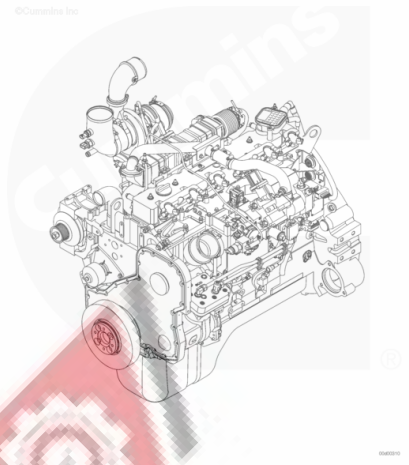
Note : All replacement steps will **not** apply to all types of equipment. Complete **only** the steps which apply to the equipment involved. Use equipment manufacturer recommendations and precautions for removal of chassis parts to gain access to the engine.



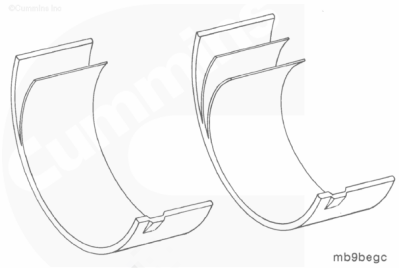
The procedures required to replace an engine will vary with different engine models, the type of equipment, optional equipment, and shop facilities. Use the following procedures as a guide.

ANADOLU ISUZU AFTER SALES

Last Modified: 25-Jul-2016

General Information

Bearing, Connecting Rod



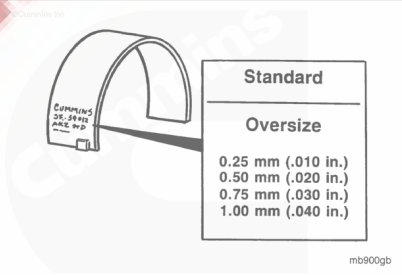
In general, various types of connecting rod bearings have been used in L series engines:

- Bi-metal overlays.
- Tri-metal overlays.

Note : Some engines may be built with a red polymer coating on the upper rod bearing, which gives the bearing a red texture finish.

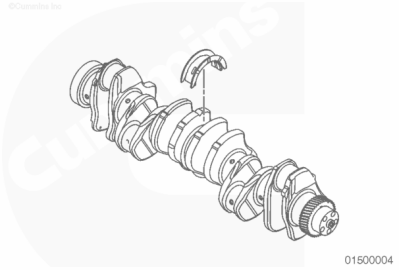
See the appropriate part information resources when replacing the connecting rod bearings, so the correct connecting rod bearings are installed.

Oversize connecting rod bearing shells are available for crankshafts that require being ground undersize.



The connecting rod bearing shells are identified by steel-stamped characters on the back of the bearings. The characters indicate either standard (STD) or the amount of oversize (OS).

Bearing, Main



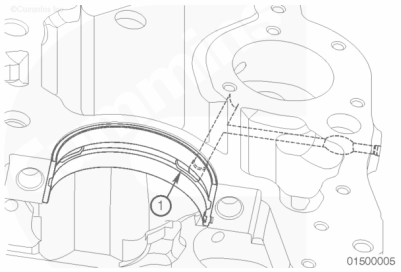
The crankshaft and cylinder block utilize main bearing journals. The main bearings for each journal are the same except for the number four main bearing journal, counted from the front of the engine. The number four main bearing journal is fitted with a flanged upper main bearing, referred to as a thrust bearing. The flanges on the main bearing control the end thrust of the crankshaft when axial loads are applied to the end of the crankshaft.

Note : During bearing inspection, while the engine is in chassis, try to avoid removing the thrust bearing. If the thrust bearing is removed for inspection, it **must** be replaced with a new thrust bearing. The 180 degree thrust washers are designed to separate from the main bearing shell in operation. Use the following procedure for more information on main bearings. Refer to Procedure 001-006 in section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-006.html)

ANADOLU ISUZU
DEALER SALES

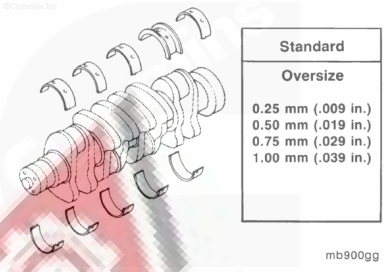
The upper bearings have two slots in them. The slot (1) on the intake side of the engine receives lubricating oil from the main oil rifle.

There is a drilling from the main bearing saddle to the camshaft bore. This drilling is bisected by the intake side oil rifle and provides oil to the main bearings.



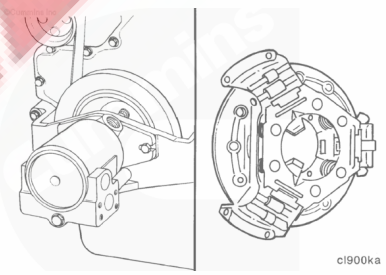
Oversize main bearing shells are available for crankshafts that require being ground undersize.

The main bearing shells are identified by steel-stamped characters on the back of the bearings. The characters indicate either standard (STD) or the amount of oversize (OS).

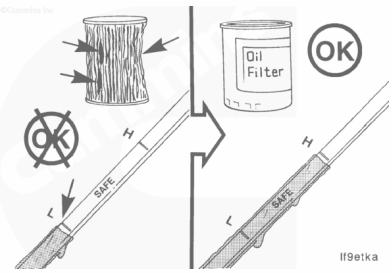


A common cause for increased crankshaft end clearance and thrust bearing damage is increased end-loading of the engine. The increased end-loading can be the result of driven units at the front or rear of the engine being:

- Incorrectly installed.
- Incorrectly adjusted.
- Incorrectly matched to the engine and exceeding the thrust load limits.



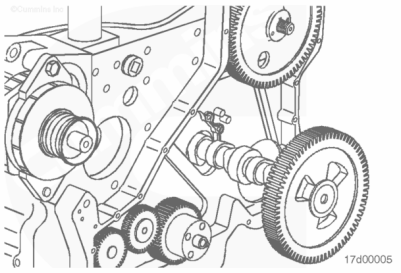
Improper maintenance of the lubricating system is the primary cause of reduced bearing life. Refer to Procedure 007-083 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-083.html)



Camshaft and Gear

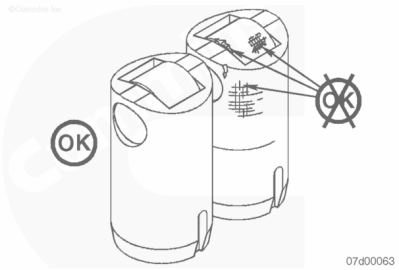
The camshaft is of a cast iron material and is gear-driven directly off of the crankshaft gear.

The camshaft gear is located at the front of the engine, and is pressed onto the camshaft.



ANADOLU ISUZU PARTS

The camshaft has lobes to operate the intake and exhaust valves. The valve lobes contact roller valve tappets that operate the push rods.

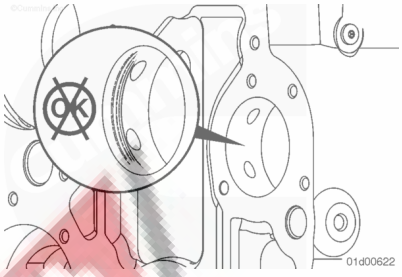


Camshaft Bushings

The engines covered by this manual have seven camshaft bushings, starting with camshaft bushing 1 at the front of the engine.

Camshaft bushings 1 through 6 can be replaced through the front of the engine by driving them towards the rear of the engine.

Replacing camshaft bushing 7 requires the flywheel housing and the cup plug at the rear of the camshaft to be removed, to drive camshaft bushing 7 forward for replacement.

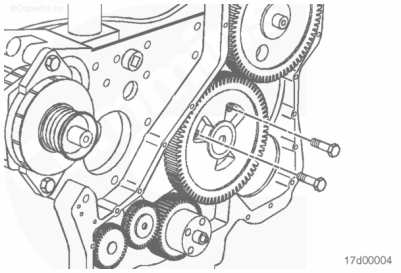


Camshaft Thrust Plate

The camshaft thrust plate is used to control the camshaft end clearance.

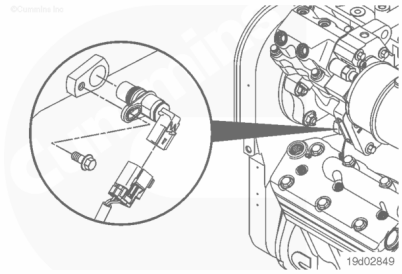
The camshaft thrust plate is located between the camshaft gear mounting flange and camshaft journal.

Note : Because the thrust plate extends more than 180 degrees around the camshaft, the thrust plate can **only** be removed from the camshaft after removing the camshaft gear from the camshaft.



Camshaft Speed Indicator Ring

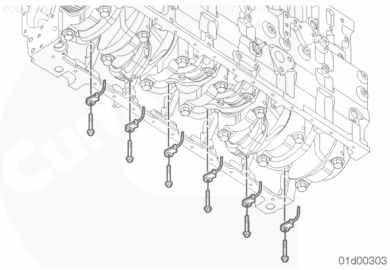
The camshaft speed indicator ring is located on the back side of the camshaft gear.



Piston Cooling Nozzles

The engines covered by this manual use J-jet piston cooling nozzles located in between the main bearing saddles on the exhaust side of the engine. Lubricating oil is supplied from

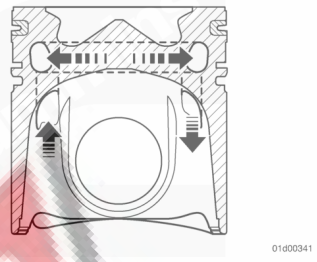
an oil gallery in the cylinder block on the exhaust side of the engine.



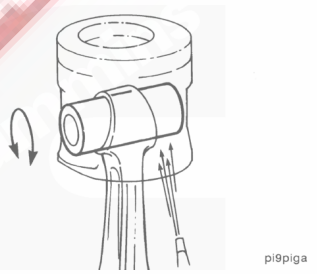
Piston and Connecting Rod Assembly

The piston cooling nozzles supply lubricating oil to the underside of the pistons.

An open chamber oil gallery is located on the underside of the crown of the piston to provide more oil contact with the piston and provide better piston cooling.

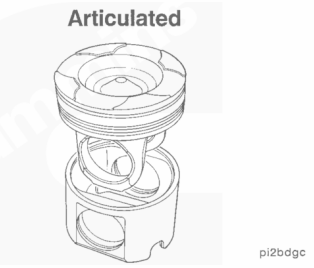


A free-floating, hollow piston pin is used to attach the piston to the connecting rod. Lubrication for the piston pin and journal is supplied by residual spray from the piston cooling nozzles.



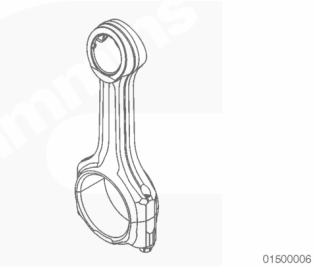
Pistons

Depending on horsepower rating, the engine has aluminum mono block pistons or articulated pistons. The articulated piston is a two piece piston consisting of a forged steel crown and an aluminum skirt.



Connection Rods

The engine has straight fracture split connecting rods with the fractured surface at the crankshaft end. These connecting rods can **not** be mixed in with previous product ISC/ISL engines.



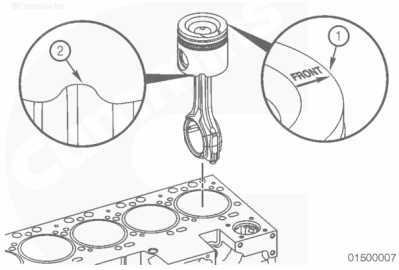
When assembling and installing the piston and connecting rod assembly, it is critical the orientation of the components is correct.

ANADOLU ISUZU AFTER SALES

For all piston types make sure the "FRONT" marking on the piston crown is pointed toward the front of the engine block.

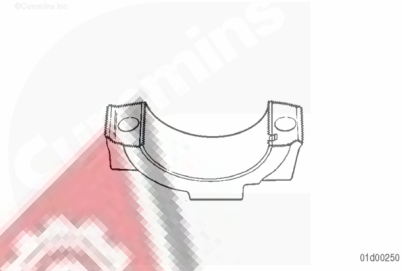
The notch in the piston skirt provides clearance for the J-jet piston cooling nozzle when the piston is at bottom dead center.

Piston grading is **not** required for the engines covered by this manual.



The contact surface between the connecting rod and connecting rod cap is **not** a machined surface. The surface is the result of the connecting rod being fractured during the manufacture process to separate the connecting rod cap from the connecting rod.

This surface can **not** be considered damaged unless there are deep nicks or cracks across the surface.

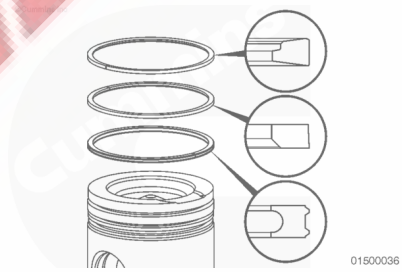


Piston Rings

The piston ring type and location can be identified by the piston ring profile.

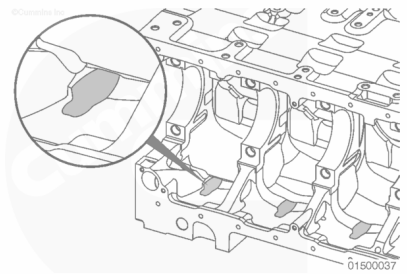
- Top piston ring (top)
- Intermediate piston ring (middle)
- Oil control ring (bottom).

Make certain to reference the appropriate part information resources when replacing the piston rings, so the correct components are installed.



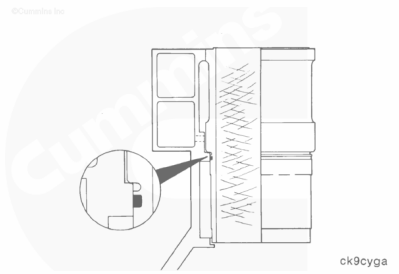
Cylinder Block

The CM2350 cylinder block design incorporates clearance scallops on the hot side skirt to accommodate the new larger rod design.



The cylinder block has a replaceable cylinder liner. A mid-stop design is used to locate the liner in the block. A press fit between the liner and block provides coolant sealing at the top of the liner. A rectangular ring seal (liner seal) is used for sealing at the mid-stop portion of the liner.

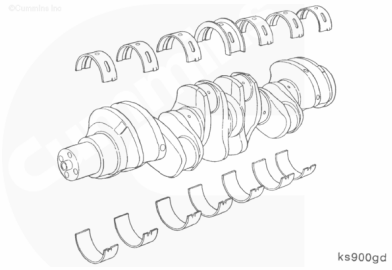
Note : If a liner bore is **not** acceptable for reuse, it **must** be replaced. Damaged liners can **not** be honed



ANADOLU ISUZU
PARTS SALES

or deglazed. This would destroy the cross-hatch pattern needed for oil control.

Crankshaft and Crankshaft Speed Indicator



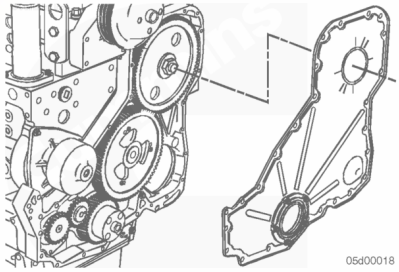
The crankshaft uses forged counterweights. Cummins Inc. recommends regrinding all of the main or the connecting rod journals when one requires regrinding.

The crankshaft speed indicator feature is located on the rear end of the crankshaft. The crankshaft speed sensor is mounted on the cold side of the engine block, near the flywheel housing.

Vibration Damper

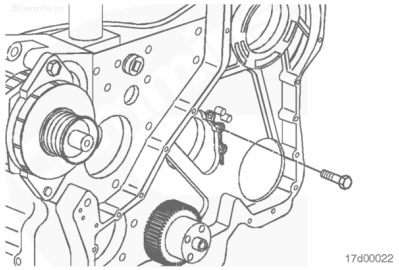
The engine uses a 5 bolt rubber or viscous damper.

Gear Cover, Front



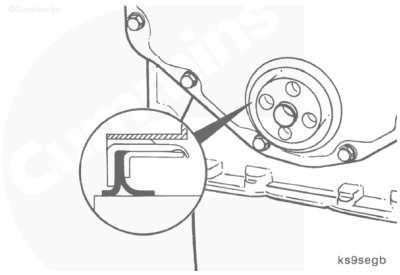
The front gear cover houses the lubricating oil pump, front crankshaft seal, and camshaft speed indicator ring.

Gear Housing, Front



The front gear housing is used to mount the fuel pump and a gear driven accessory drive.

Crankshaft Seal, Front

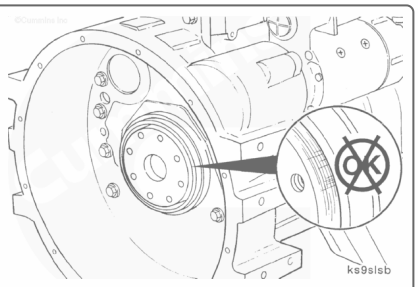


The engine uses a lip style front crankshaft seal (shown) in which the rotating portion of the sealing occurs at the contact surface between the lip of the seal and crankshaft.

Always replace the front crankshaft seal with the same style seal as was previously installed.

ANADOLU ISUZU AFTER SALES

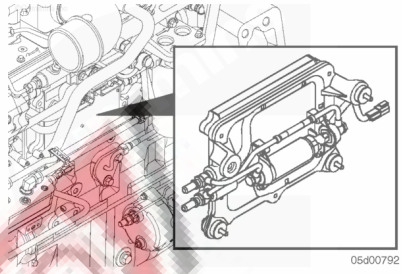
Crankshaft Seal, Rear



The engine uses a lip style rear crankshaft seal in which the rotating portion of sealing occurs at the contact surface between the lip of the seal and crankshaft.

The rear crankshaft seal is installed in the crankshaft seal carrier.

Engine Control Module (ECM) Mounting Plate



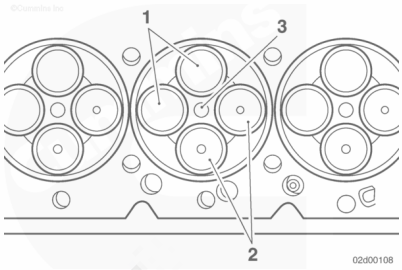
A composite mounting plate and rubber vibration isolators are used to mount the ECM to the cylinder block.

ANADOLU ISUZU
AFTER SALES

Last Modified: 25-Jul-2016

General Information

Cylinder Head Assembly

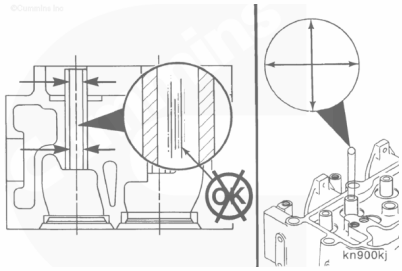


The cylinder head is a one-piece, cross flow design with four valves per cylinder. The cylinder head has an integral intake manifold and thermostat housing. The four valve per cylinder design allows for a centered injector in the cylinder head (3).

The intake and exhaust valves (1 and 2) are made of heat resistant steel, and have chrome plated stems to prevent scuffing. The intake and exhaust valves are both similar in head diameter and overall length, but have unique face angles, which makes them non-interchangeable. The exhaust valves are distinguished by unique dimples on the valve head (2).

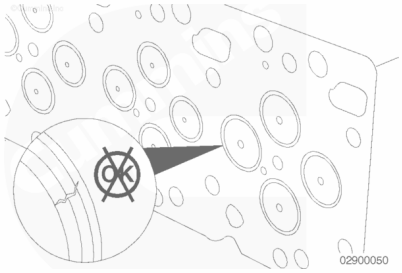
The exhaust valve springs are made from high strength, chrome silicon steel. The exhaust valve spring ratings allow for a exhaust back pressure device for enhanced engine braking.

Valve Guides



The cylinder head has pressed in valve guides that are **not** serviceable. If the valve guide inside diameter is damaged or worn larger than the maximum specified, the cylinder head must be replaced.

Valve Seat Inserts

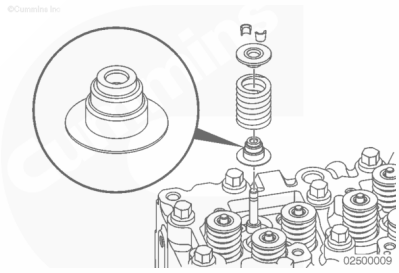


If the valve seat has dropped out and caused damage to the cylinder head combustion face, the cylinder head must be replaced. Use the following procedure for cylinder head inspection criteria. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)

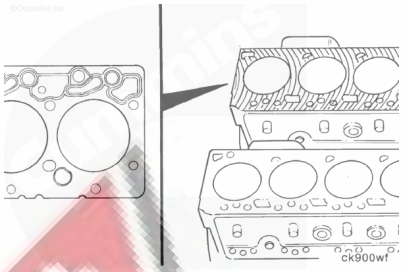
Valve Stem Seals

The valve stem seal utilizes the valve spring to secure the valve stem seal in place.

ANADOLU ISUZU PARTS SALES



Cylinder Head Gasket

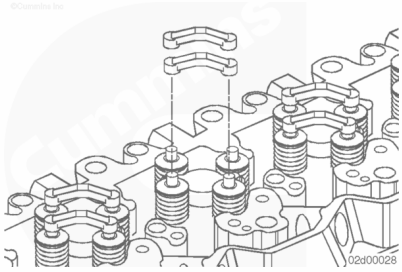


The cylinder head gasket is a graphite design with a printed silicone sealing path on both sides around the water holes. An embossment in the gasket seals the cylinder bores. The gasket also provides orifices to control coolant flow from the cylinder block to the cylinder head.

The head gasket grading is **not** required for the engines covered by this manual.

No specific head gasket with an increased thickness is available for cylinder head or block combustion deck resurfacing. If the combustion deck can **not** be resurfaced such that piston protrusion, valve depth, and injector protrusion specifications be maintained, the cylinder head and/or cylinder block **must** be replaced.

Crossheads



With the four valve per cylinder design, the rocker lever sockets do **not** directly contact the valve stem. With one rocker lever being required to operate two valves, a bridge, or crosshead, is needed to connect both intake and exhaust valves.

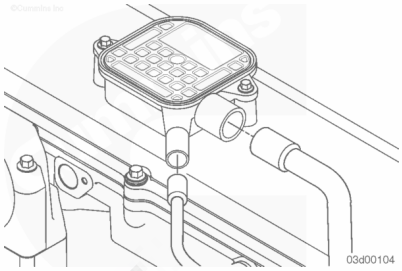
The socket on the rocker lever contacts the crosshead, which in turn contacts both corresponding valve stems.

ANADOLU ISUZU
PARTS SALES

Last Modified: 25-Jul-2016

General Information

The crankcase breather system utilizes a baffle system that is mounted on the valve cover. The breather contains two tubes. The larger tube is the crankcase gas draft tube. The smaller tube is for draining oil that is accumulated in the valve cover baffle. The oil is drained back to the oil pan through a port on the lower intake-side of the cylinder block.

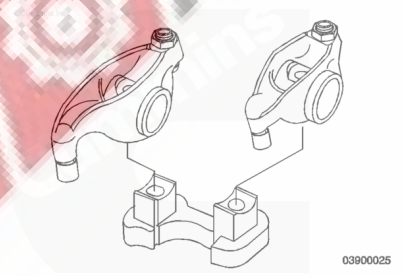


There is no maintenance required for any breather system components.

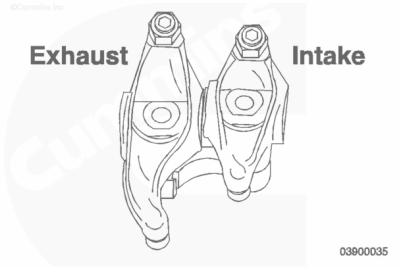
Rocker Levers

The exhaust and intake rocker levers are mounted on a common pedestal, but rotate on separate shafts.

Oil is supplied through a drilling in the cylinder head through the pedestals to supply oil to the rocker shafts, socket, and adjusting screw.

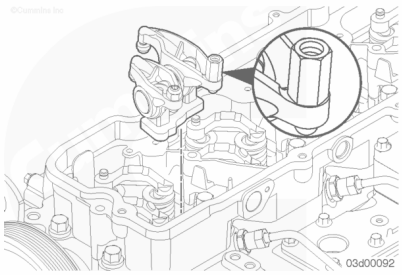


The exhaust and intake rocker levers are **not** interchangeable and **must** be located as shown.



If the engine is equipped with compression brakes, the exhaust rocker levers will have a longer adjusting screw locknut.

Special capscrews are also used to hold down the exhaust rocker levers on engines equipped with compression brakes.



Rocker Lever Cover

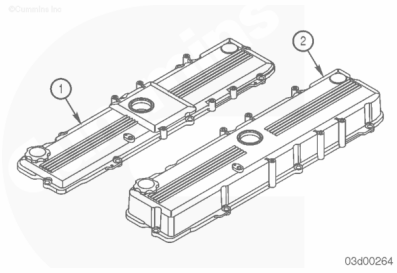
Several different kinds of rocker lever covers are available:

A tall rocker lever cover for engines with compression brakes (2).

ANADOLU ISUZU
AFTER SALES

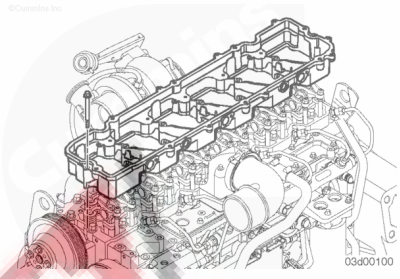
A short rocker lever cover for engines without compression brakes (1).

Additionally, various oil fill options are available (front oil fill, rear oil fill, or no oil fill).



Rocker Lever Housing

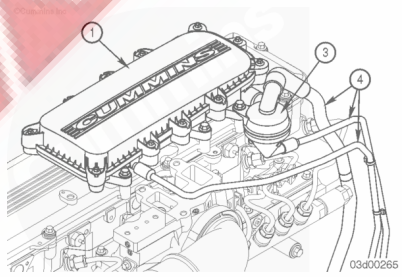
A rocker housing spacer is required on the engines covered by this manual to accommodate a pass-through location for the injector wiring harness. The rocker housing utilizes a press-in-place gasket to form a seal with the cylinder head. The valve cover is mounted to the rocker housing by capscrews, isolators, and a press-in-place gasket.



Crankcase Breather

The crankcase breather is located on top of the rocker lever cover towards the rear of the engine and consists of four main parts:

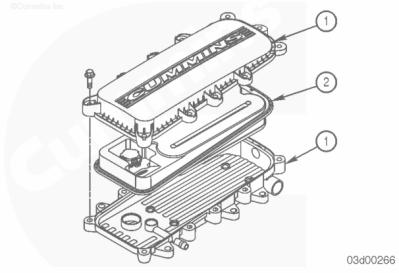
1. Crankcase breather housing
2. Crankcase breather element (**not** shown)
3. Oil separator
4. Oil drain and draft tubes.



The crankcase breather housing (1) is attached to the valve cover and contains the crankcase breather element.

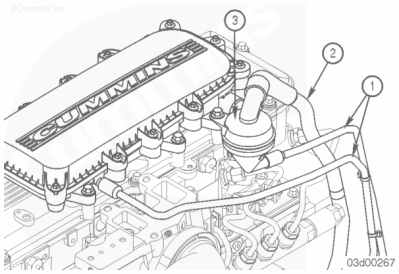
The crankcase breather element (2) filters engine oil from the blowby gas and returns it to the crankcase via an oil drain tube.

The crankcase breather element requires periodic replacement. Reference the appropriate Operation and Maintenance and/or Owner's Manual for the correct maintenance specification.



The drain lines (1) return excess lubricating oil from the crankcase breather housing and oil separator to the lubricating oil pan.

The crankcase breather draft tube (2) attaches to the oil separator and vents the filtered blowby gas to the atmosphere.



ANADOLU ISUZU
OTOR SALES

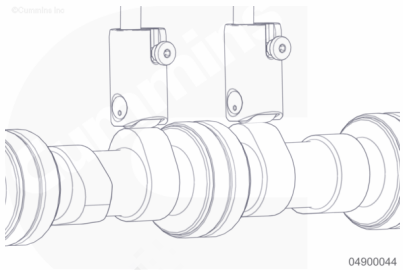
The oil separator (3) is attached to the outlet of the crankcase breather housing and removes any remaining lubricating oil from the blowby gas before the blowby gas is vented to the atmosphere.

Last Modified: 08-Nov-2016

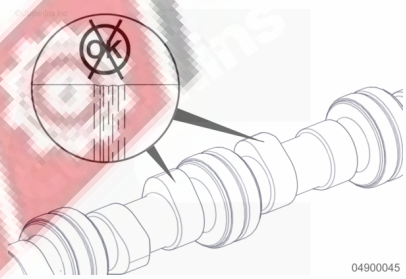
ANADOLU ISUZU AFTER SALES

General Information

The engine covered by this manual utilizes roller tappet assemblies.



Loose rocker lever lash and the need to reset the valve clearance frequently can indicate camshaft valve lobe or tappet wear. If an inspection of the rocker levers, valve stems, crossheads, and push rods does **not** show wear, the tappet and/or camshaft valve lobe wear **must** be checked.



The push rod is a solid link between the tappet and rocker lever. At the bottom, the ball end of the push rod fits into a ball socket in the tappet. At the top, the push rod is fitted with a socket into which the ball end of the rocker lever adjusting screw is seated.

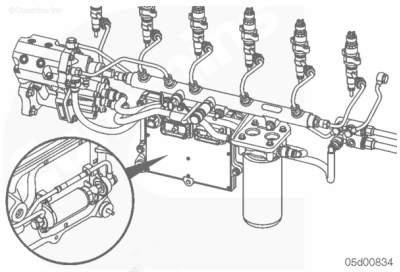
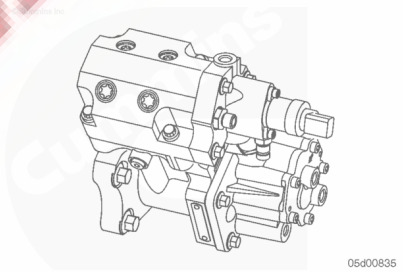
General Information

The fuel system is a high-pressure common rail injection system. A fuel rail is used to store pressurized fuel for fuel injection. There are four components that provide or receive input to the engine control module (ECM). The ECM powers the electric fuel lift pump (located behind the ECM) for approximately 30 seconds at keyswitch ON to prime the fuel system. The normally open fuel pump actuator receives a pulse width modulated (PWM) signal from the ECM to open or close in response to the signal from the fuel rail pressure sensor. The injectors have individual solenoids. The ECM powers each injector individually to provide fueling to each cylinder.

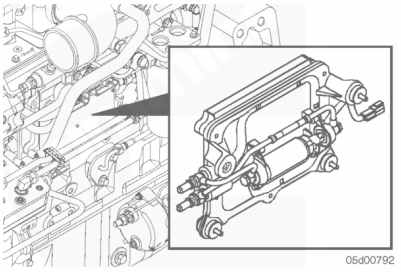


The high-pressure fuel pump can be divided into four distinct assemblies. They are the fuel gear pump, fuel pump actuator housing, cam housing, and high-pressure fuel pump head. Fuel flows through the gear pump to a pressure-side filter. After the pressure-side filter, fuel enters the fuel pump actuator housing. The fuel pump actuator housing includes an air-bleed fitting and fuel pump actuator. Some fuel continuously returns to drain through the air-bleed orifice fitting. Fuel metered through the fuel pump actuator enters the high-pressure fuel pump head where it is pumped to fuel rail pressure and exits at the high-pressure outlet fitting.



A lift pump is used for priming the gear pump at start-up. The lift pump runs for approximately 30 seconds after keyswitch ON. Once the engine is started, the gear pump is able to maintain prime without any assistance from the lift pump.

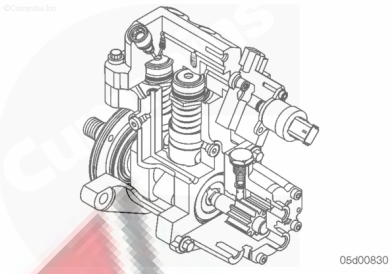
A bypass check valve in the ECM mounting plate makes sure the system is primed by the lift pump. This check valve opens under vacuum created by the gear pump, once the engine is started. High vacuum measured between the electric lift pump and gear pump can indicate this check valve has become plugged. The ECM mounting plate check valve is integral with the lower (outlet) fitting of the ECM mounting plate.



The ECM and ECM mounting plate **must** be removed to access the lift pump and lift pump fuel lines. This is accomplished by disconnecting the engine harnesses and fuel lines first. Removal of the ECM mounting plate capscrews allows the ECM, mounting plate, lift pump, and lift pump plumbing to be removed as one assembly.

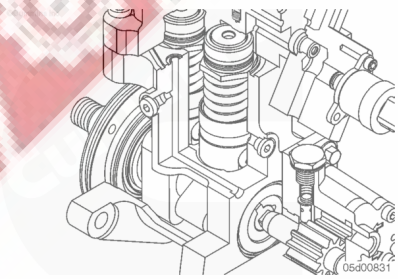
The gear pump output is routed to a fuel filter. The filtered fuel returns to the fuel pump actuator housing.

The high-pressure pump is driven by the engine camshaft. The gear pump is driven by the pump camshaft through an internal coupling.



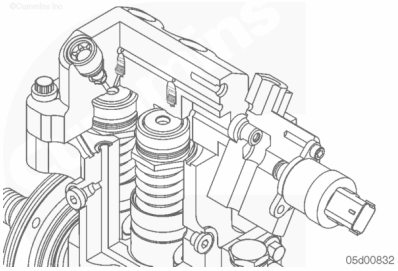
Each of the two pumping plungers is driven by a three lobed camshaft. The camshaft is located in the cam housing module by tapered roller bearings. The bearings that support the camshaft, as well as the tappets, rollers, and camshaft itself are lubricated with engine oil. These are the only components in the pump lubricated with engine oil.

Engine oil to the high-pressure pump is supplied through a drilling in the engine gear housing. The oil passes from the engine gear housing to the high-pressure pump cam housing. A small o-ring in a recess on the back of the engine gear housing seals this passage.



Pressurized fuel from the gear pump is supplied to the fuel pump actuator. The fuel pump actuator is opened or closed by the ECM to maintain the appropriate fuel rail pressure.

An air-bleed orifice fitting in the fuel pump actuator housing aids in purging air from the fuel supply. Because of the air-bleed orifice fitting, some fuel supplied by the gear pump will return to drain at all times.



Fuel metered past the fuel pump actuator enters the high-pressure fuel pump inlet drilling, past the inlet check valve, and fills the pumping chamber by pressing the pumping plunger downward. When the camshaft pushes the pumping plunger upward, fuel reaches rail pressure and causes the outlet check valve to lift. Fuel then enters the outlet drilling of the fuel pump and exits the high pressure fuel line to the fuel rail.

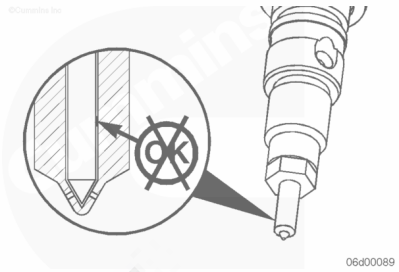
General Information

⚠ WARNING ⚠

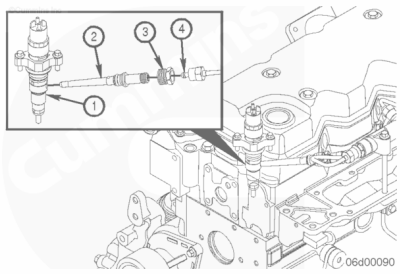
Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.



High-pressure common rail fuel systems use solenoid-actuated injectors. High-pressure fuel flows into the side of the injector. When the solenoid is activated, an internal needle lifts and fuel is injected. The clearances in the nozzle bore are extremely small and any dirt or contaminants can cause the injector to stick. This is why it is important to clean around all fuel connections before servicing the fuel system. Also, cap or cover any open fuel connections before a fuel system repair is performed.

⚠ CAUTION ⚠

To reduce the possibility of engine damage, always use the proper torque value and proper torque sequence on the high-pressure line nuts.



High-pressure fuel is supplied to the injector from the fuel rail by an injector supply line and a fuel connector. The fuel connector pushes against the injector body when the fuel connector nut is tightened. The injector supply line is then connected to the fuel connector.

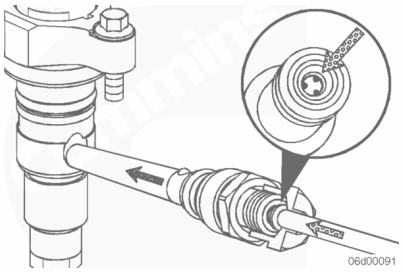
The torque and sequence for this joint is critical. If the nut or line is undertightened, the surfaces may **not** seal and a high-pressure fuel leak will result. If the nut is overtightened, the connector and injector will deform and can cause a high-pressure fuel leak. This leak will be inside the head and will **not** be visible. The result will be a fault code, low power, or no-start.

If the injector is **not** fully seated prior to the installation of the high-pressure connector, the joint will **not** seal.

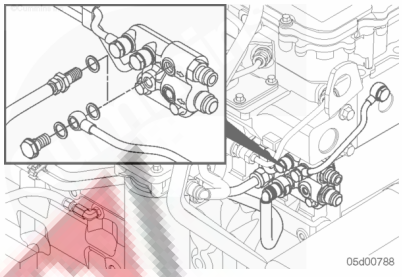
The fuel connector contains an edge filter that breaks up small contaminants that enter the fuel system.

The edge filters are **not** a substitute for cleaning and covering all fuel system connections during repair.

Make sure to cap or cover all fuel fittings and ports.



All injectors feed into a common return drilling contained within the cylinder head. Any excess fuel is returned to the tank via this drilling and return line attached to the rear of the cylinder head. A back-pressure valve is located on the back of the cylinder head where the drain line attaches.

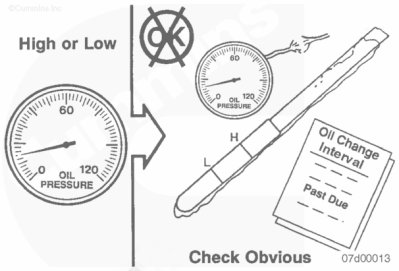


ANADOLU ISUZU
AFTER SALES

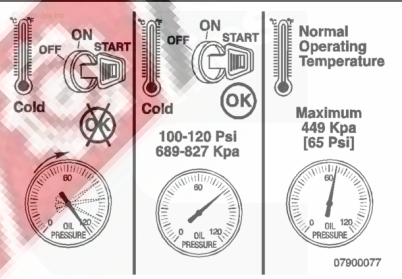
Last Modified: 25-Jul-2016

General Information

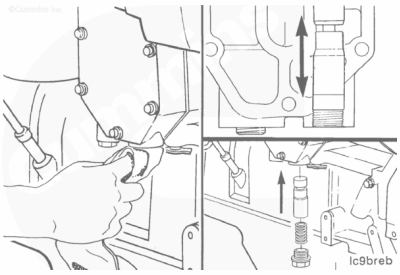
When diagnosing lubrication system malfunctions, check all obvious items related to oil pressure, such as gauges, high and low oil level, excessive oil contamination, and oil viscosity.



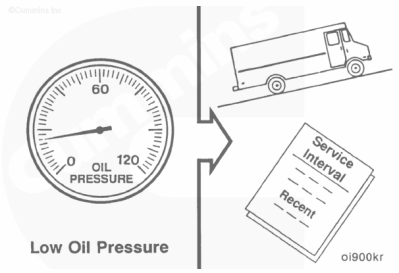
High oil pressure usually occurs after the engine is first started in cold weather. Cold start oil pressure typically will be approximately 827 to 1034 kPa [120 to 150 psi]. If the pressure regulator plunger is operating properly, the oil pressure should drop back to approximately 449 kPa [65 psi] when normal operating temperature is reached.



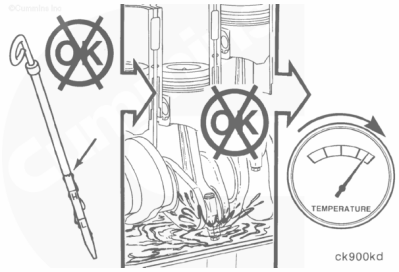
The engine will have high oil pressure at the normal operating temperature if the regulator sticks in the closed position. Check the regulator for freedom of movement. Refer to Procedure 007-029 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-029.html)



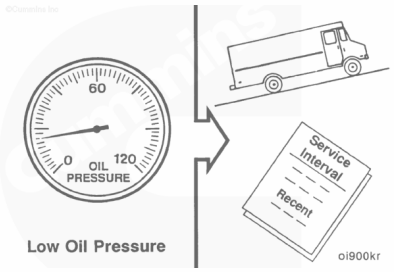
Low lubricating oil pressure (or no oil pressure) can be caused by several lubrication system-related malfunctions. To begin the investigation, determine the engine operating conditions when the low pressure was first observed; for example, following a service interval, at idle **only**, or while operating on a steep grade.



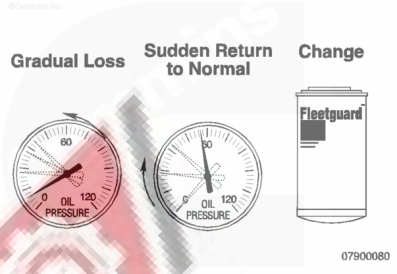
High oil level can cause low oil pressure. If the oil level is high enough for the connecting rods to dip into during operation, the oil can become aerated. This will result in low oil pressure and high engine temperature.



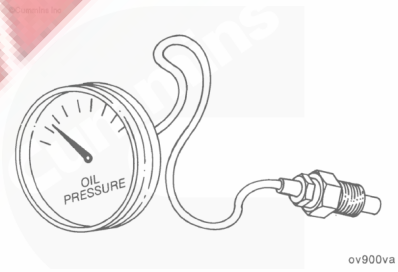
Low lubricating oil level will **not** normally appear as low oil pressure. Typically, it will appear as an intermittent loss of oil pressure when rounding a corner or operating on a steep grade. This condition exists when the oil level is extremely low and the suction tube can **not** pick up oil during all modes of operation.



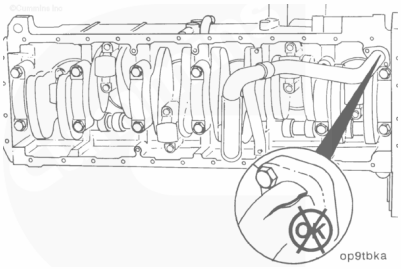
A plugged filter will cause a gradual loss of oil pressure by approximately 69 kPa [10 psi]. The pressure will return to normal when the filter bypass valve opens. If **not** corrected, this will result in severe engine wear, as the engine is running on unfiltered oil when the bypass valve is open.



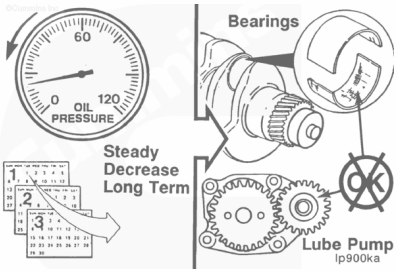
Check the lubricating oil gauge and sending unit to make sure they are operating correctly, by verifying the pressure with a manual gauge.



A loose suction tube, damaged gasket, or crack in the suction tube can cause a temporary loss of prime for the oil pump. The engine will have low pressure or no oil pressure at starting, followed by normal oil pressure.



A steady decrease in oil pressure over a long period can be an indication of worn bearings or excessive oil pump wear.

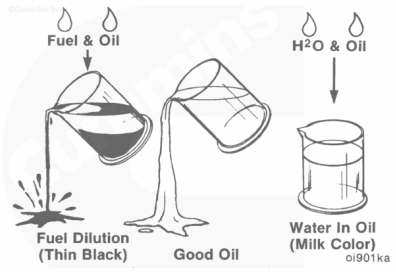


Check the condition of the lubricating oil.

- Thin, black lubricating oil is an indication of fuel in the lubricating oil.

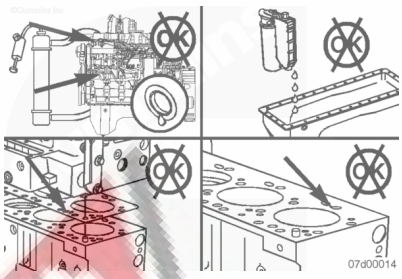
ANADOLU ISUZU
OFFICIAL SALES

- Milky discoloration is an indication of coolant in the lubricating oil.

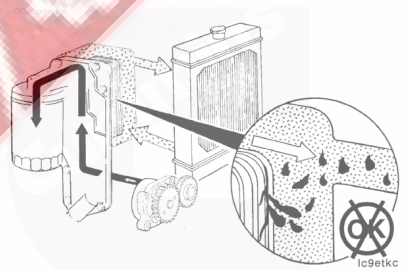


Coolant in the oil can be caused by:

- Expansion plugs leaking
- Lubricating oil cooler element leaking
- Damaged cylinder head or gasket
- Cracked engine block
- Casting porosity.

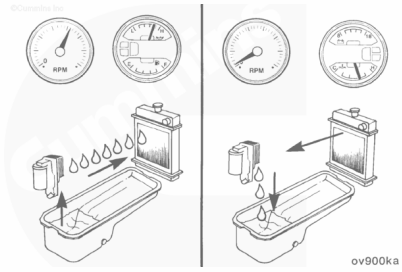


Since the lubricating oil cooler design does **not** require gaskets or seals to maintain the separation of oil and coolant, the element itself **must** leak to allow mixing of the fluids. Refer to Procedure 007-003 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-003.html)



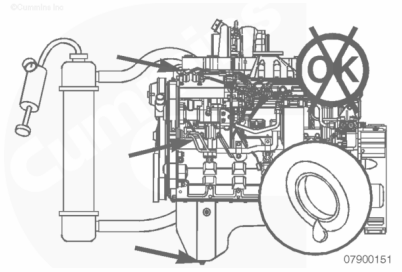
During operation, the lubricating oil pressure will be higher than coolant pressure. A leak in the lubricating oil cooler will appear as lubricating oil in the coolant.

However, following an engine shutdown, the residual pressure in the coolant system can cause coolant to seep through the leak path into the lubricating oil.



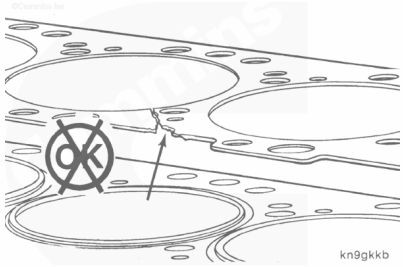
To check for leaks, pressurize the cooling system to 140 kPa [20 psi]. With the system pressurized, remove the following components, and inspect for leaks:

- Valve covers (leaks indicate cracked head)
- Lubricating oil drain plug (leaks indicate malfunctioning lubricating oil cooler, head gasket, cracked head, or block).



Coolant in the lubricating oil can be caused by a damaged cylinder head gasket or cracked cylinder head or block.

Remove the cylinder head and gasket, and inspect for cracks or other damage. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)



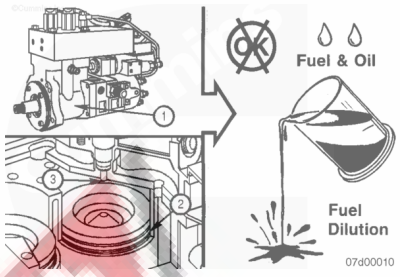
Fuel-Diluted Lubricating Oil

Use the following logic to determine the source of the oil dilution with fuel.

Fuel dilution is limited to three sources:

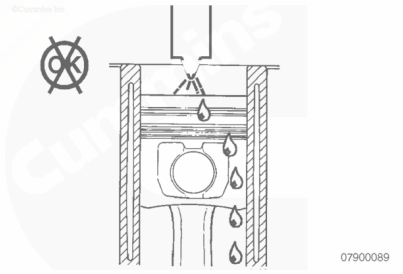
- Injection pump camshaft housing
- Fuel leaking by the rings
- Injector leakage.

A cracked camshaft housing can cause fuel to leak into the gear housing and then into the lubrication oil pan.



Incomplete combustion in the cylinders can result in unburned fuel draining into the oil pan.

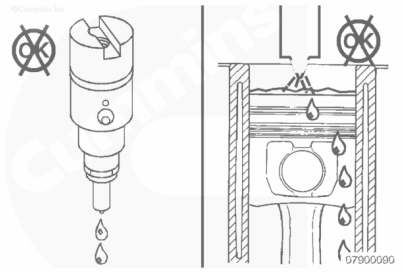
This condition can be caused by a leaking injector or reduced compression caused by inadequate piston ring sealing.



An increase in white exhaust smoke during the first start of the day is a symptom an injector is leaking.

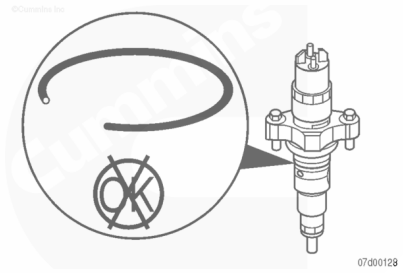
An injector leak will also cause the engine to run rough and have low power.

Use the following procedure for remove, repair, replace leaking injector, test, and repair instructions. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)



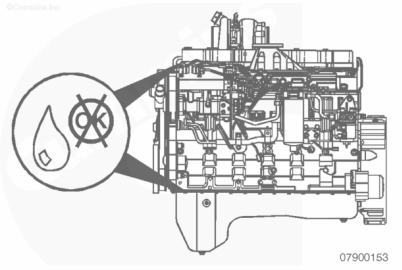
The o-rings in the injectors should be inspected for cracks or wear. A missing or damaged o-ring in an injector can result in improper injection of fuel into the cylinder.

Also, a poor seal between the injector and high-pressure transfer tube can also cause the injector o-rings to malfunction or leak into the top of the cylinder head.



ANADOLU ISUZU
AFTER SALES

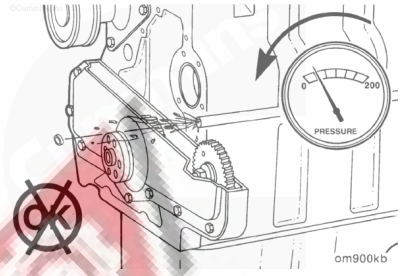
Various gaskets, seals, and plugs are used to contain the lubricating oil. Most leaks can be identified during routine inspection of the engine and vehicle.



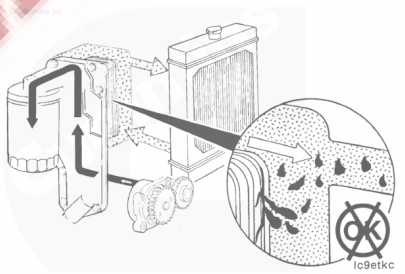
A blown expansion plug can allow a relatively large quantity of lubricating oil to escape, resulting in a sudden drop in the lubricating oil pressure.

When checking for such a leak, make sure to check all expansion plugs obscured by chassis parts.

Lubricating oil blowing out of the breather is a sign of a blown expansion plug.

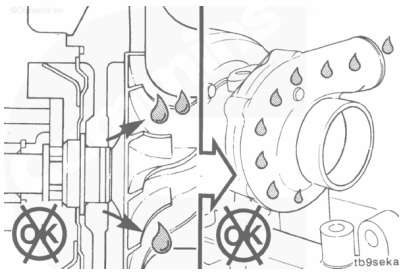


If the lubricating oil cooler element ruptures, the lubricating oil pressure can force lubricating oil into the cooling system. Lubricating oil in the coolant should be visible when the radiator cap is removed. Refer to Procedure 007-003 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-003.html)

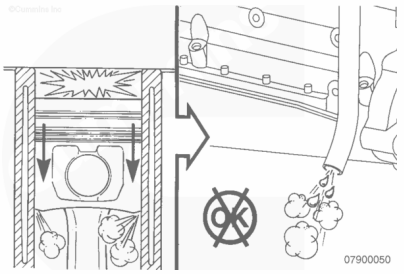


Worn or damaged seals in the turbocharger can also allow lubricating oil to leak into the air crossover pipe and be burned in the engine.

The condition can be verified by removing the air crossover tube or charge air cooler tubing and looking for oil.

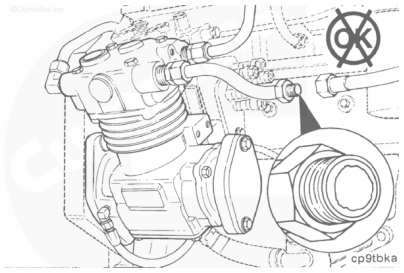


Inadequate sealing of the piston rings will result in lubricating oil being blown out the breather tube and/or consumed by the engine. Refer to Procedure 014-002 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-002.html)



ANADOLU ISUZU
ISUZU SALES

Lubricating oil can also be lost through a worn or malfunctioning air compressor. Check for carbon buildup in the air line from the compressor to the air tank. Also, a malfunctioning air compressor head or head gasket can allow oil to leak into the coolant, or coolant to leak into the oil, during hot shutdown.



The lubricating oil cooler contains two ports for measuring oil pressure or recording oil pressure drop across the lubricating oil filter. The top port is after the lubricating oil filter, filtered oil pressure port (A). The bottom port is before the lubricating oil filter, unfiltered oil pressure port (B).

Lubricating Oil Filters

The LF9009 oil filter is used on all engines. This filter is a spin-on element and contains an internal venturi that provides filter bypass oil flow through a stacked disk section of the filter. Lubricating oil filters **must** be of the venturi style. The use of a lubricating oil filter without a venturi will result in premature engine wear.

Lubricating Oil

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and can cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

Note : Use the following procedure for lubricating oil requirements and maintenance intervals in the Operation and Maintenance Manual, L9 CM2350 L119B, Bulletin 5411268. Refer to Procedure 358-001 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-358-001-om.html)

BURDLU ISUZU SALES

Use the following procedure when searching for bulletin numbers. Refer to Procedure 205-001 in Section L. (/qs3/pubsys2/xml/en/procedures/425/425-205-001.html)

Cummins Inc. recommends the use of a high quality, Society of Automotive Engineers (SAE), heavy-duty engine oil, such as Premium Blue™, which meets the American Petroleum Institute (API) performance classification.

Arctic Operation Engine Oil

⚠ CAUTION ⚠

Limited use of low-viscosity lubricating oils, such as 10W-30, can aid in starting the engine and providing sufficient lubricating oil flow at ambient temperatures below -5°C [23°F] as shown in the illustration. However, the continuous use of low-viscosity lubricating oils can decrease engine life.

When diagnosing lubricating system malfunctions, check all obvious items related to oil pressure, such as gauges, high and low oil level, excessive oil contamination, and oil viscosity. Refer to Procedure 007-048 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-048.html)

Lubricating Oil Pump

A gerotor type lubricating oil pump is used. It is similar in design to other same series engines. The lubricating oil pump is located at the front of the engine and is driven by the front crankshaft gear. Due to the lubricating oil pump similarity in design to other same series engine lubricating oil pumps, always verify the correct replacement lubricating pump is used before installing a new lubricating oil pump. See the appropriate part information resources when replacing the lubricating oil pump to make sure the correct lubricating oil pump is installed.

Lubricating Oil Cooler

A full-flow, plate-type lubricating oil cooler is used. It is similar in design to other same series engines. The lubricating oil cooler is located in a cylinder block cavity on the exhaust side of the engine, mounted between the

lubricating oil cooler cover and the cylinder block. Lubricating oil flows through the plates of the oil cooler, where it is cooled by engine coolant flowing past the plates.

Due to the similarity in design to other same series engine lubricating oil coolers, always verify the correct replacement lubricating oil cooler is used before installing the new replacement. The main difference between the various lubricating oil coolers is the number of plates. Depending on engine configuration, the engine can require more (B) or less (A) plates to adequately cool engine lubricating oil.

The use of incorrect components can cause high or low oil temperature, varnish, and sludge buildup in the lubricating oil system.

⚠ CAUTION ⚠

Be careful at debris is not poured into the filter. If using an oil supply with a metallic or plastic seal under the cap, be careful to peel the seal back. Puncturing the seal with a knife or sharp object can put debris in the oil container. Engine damage can occur.

Lubricating Oil Filter

A full-flow oil filter is used for engine oil filtration. The oil filter is located on the exhaust side of the engine, toward the front. Some applications utilize a remote lubricating oil filter option, mounting the lubricating oil filter on the vehicle instead of the engine.

Cummins Inc. recommends the oil filter be pre-filled when changed to prevent lubrication oil pressure delay at start-up.

Lubricating Oil Pressure Regulator

The lubricating oil pressure regulator is used to prevent high lubricating oil pressure. The oil pressure regulator is located in the lubricating oil cooler cover on the exhaust side of the engine. The lubricating oil pressure regulator consists of a cap, spring, and plunger.

The oil pressure regulator is similar in design to other same series engines. Always verify the correct replacement lubricating oil pressure regulator components are used before installation.

ANADOLU ISUZU OFFICIAL SALES

Lubricating Oil Thermostat

The lubricating oil thermostat mounted in the lubricating oil cooler regulates the temperature of the lubricating oil to 116°C [240°F] by bypassing the lubricating oil cooler at lower lubricating oil temperatures.

Lubricating Oil Pan

A front sump (1), rear sump (2), or center sump (3) lubricating oil pan option can be used, depending on the application. The mounting of the lubricating oil suction tube will vary with the type of lubricating oil pan used.

Engine Oil Heater

Some engine oil pans allow for an optional lubricating oil heater to be installed, to aid engines operating in cold climates.

Standard Oil Pan

Note : Applying RTV sealant to the gasket will help to hold the gasket in place during assembly.

A standard oil pan uses a non-reusable gasket between the lubricating oil pan and cylinder block.

Lubricating Oil Suction Tube

The lubricating oil suction tube is a formed steel tube with a cast iron mount at the cylinder block. The submersed portion of the tube in lubricating oil is perforated to prevent any large debris particles from entering the lubricating oil system.

The mounting of the lubricating oil suction tube will vary with the type of lubricating oil pan used.

Lubricating Oil Dipstick

Note : Some engine/applications also have an optional oil level sensor to notify the operator when the lubricating oil level is low.

The lubricating oil dipstick location for checking engine oil level varies by engine application.

If the dipstick is a locking type, twist the handle **counterclockwise** to unlock and **clockwise** to lock.

Lubricating Oil Pressure Sensor

To monitor oil pressure, an oil pressure sensor is used. If the oil pressure drops below a preset value, a fault will be recorded in the engine control module (ECM) and a dash light will illuminate to notify the operator there is a problem with the engine.

The oil pressure sensor is located along the main oil rifle.

Piston Cooling Nozzles

The engines covered by this manual use J-jet piston coolant nozzles located in between the main bearing saddles on the exhaust side of the engine. Lubricating oil is supplied from an oil gallery in the cylinder block on the exhaust side of the engine.

Lubricating Oil Flow Description

Lubricating Oil Pump

The engine uses a gerotor-type lubricating oil pump (1). Lubricating oil flow through the engine enters the suction tube and travels into the gerotor-type lubrication pump. The oil is then pressurized and fed into the oil cooler cover to the pressure regulating valve.

Pressure Regulating Valve

The pressure regulating valve is designed to keep the lubricating oil pressure from exceeding 449 kPa [65 psi]. When the lubricating oil pressure from the pump is greater than 449 kPa [65 psi], the valve opens, uncovering the dump port so part of the lubricating oil is routed back to the oil pan. Because of manufacturing tolerances of the components and oil passages, the lubricating oil pressure can differ as much as 69 kPa [10 psi] between engines.

Lubricating Oil Thermostat

The lubricating oil thermostat regulates the lubricating oil temperature at the oil filter inlet to 116°C [240°F] by allowing the oil to bypass the lubricating oil cooler as long as the lubricating oil temperature at the oil filter inlet is below 116°C [240°F].

Bypass Valve

Lubricating oil continues through the lubricating oil cooler to the lubricating oil bypass valve. The lubricating oil filter bypass valve will open if pressure across the lubricating oil filter exceeds 345 kPa [50 psi].

Oil Filter

Lubricating oil from the oil cooler flows through the full-flow lubricating oil filter. Oil exiting the full-flow oil filter is directed to the main oil gallery(s) of the cylinder block.

Lubrication for the Turbocharger

The turbocharger is the first component to receive filtered, cooled, and pressurized lubricating oil through a supply tube from the lubricating oil filter head. A drain tube connected to the bottom of the turbocharger housing returns the lubricating oil to the lubricating oil pan through a port in the cylinder block.

Lubrication for the Power Components

J-Jet Piston-Cooling Nozzle Oil Rifle

Lubricating oil leaving the full-flow oil filter supplies oil to the J-jet piston-cooling nozzle oil rifle, which supplies oil to the J-jet piston-cooling nozzles. Spray from the nozzles is directed at the underside of the pistons to an internal passage in the piston for cooling.

Main Oil Rifle

Lubricating oil from the oil filter also supplies oil to the main oil rifle through a drilling between cylinders 2 and 3. The main bearings, overhead components, and accessory drive are lubricated by pressurized oil directly from the main oil rifle. The other power components, connecting rods, pistons, and camshaft receive pressurized oil directly from the main oil rifle.

The drillings in the crankshaft supply oil to the connecting rod bearings. The oil is supplied to the camshaft journals through drillings in the main bearing saddle.

Lubrication for the overhead components is supplied through separate drillings in the block. The oil flows through the drillings and across the slot in the cylinder head gasket.

Lubrication for the Overhead Components

From the cylinder block, the drilling continues in the cylinder head to a drilling in the rocker lever pedestal. Internal drillings in the pedestal supply lubricating oil to the rocker shaft, push rod socket, and crosshead pad. Residual oil from the overhead lubricates the camshaft and tappets.

Lubrication for the Accessory Drive

From the main oil rifle, oil is supplied to a drilling in the rear gear housing that feeds the accessory drive. Return oil from the accessory drive is returned to the oil pan through the rear gear housing.

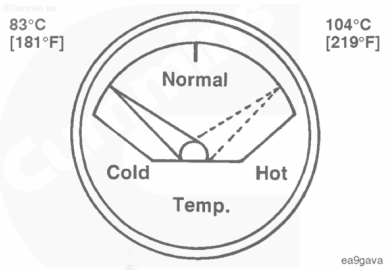
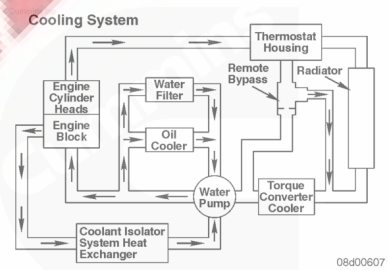
General Information

The function of the cooling system is to maintain a specified operating temperature for the engine. Some of the heat generated by the engine is absorbed by the engine coolant flowing through the passages in the cylinder block and cylinder head. Heat is removed from the coolant as it flows through the radiator.



On engines equipped with exhaust gas recirculation (EGR) and a variable geometry turbocharger (VGT), there are additional components that depend on the cooling system for heat dissipation. Refer to Procedure 010-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-010-999.html)

Conventionally cooled engines with automatic transmissions typically use oil-to-water transmission torque converter coolers plumbed between the radiator and the engine water pump.

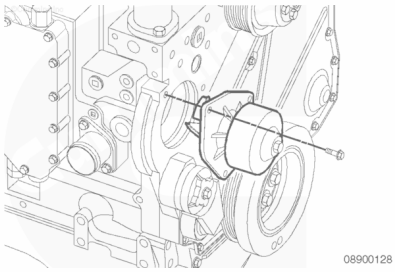


A torque converter cooling system with a remote bypass allows the torque converter to receive coolant flow when the thermostat is closed (engine cold).

Transit bus applications use a water-to-water heat exchanger to isolate the engine cooling system from the bus heat system.

Water Pump

The water pump is a belt-driven, centrifugal-type pump with the inlet and bypass as integral parts of the cylinder block. The water pump is located at the front of the engine and can **only** be replaced as an assembly.



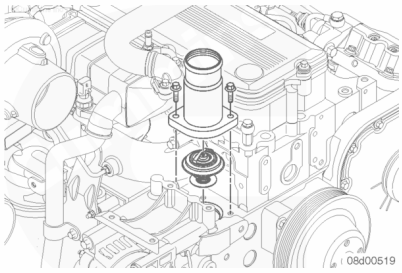
Due to water pump design similarities, especially in same-series engines, **always** verify the correct replacement water pump is used before installing a new water pump.

The main difference in the various available water pumps is the drive pulley size. The use of the incorrect water pump can cause decreased coolant flow and damage due to overheating conditions.

Thermostat

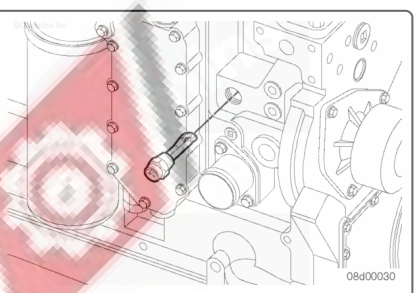
The thermostat controls the engine coolant temperature. The thermostat is located at the front of the engine in the cylinder head. The opening and closing of the thermostat is controlled by a wax motor.

When the coolant temperature is below the operating range of the thermostat, engine coolant is bypassed back to the inlet of the water pump. When the engine coolant temperature reaches the operating range, the thermostat opens, sealing off the bypass, forcing engine coolant to flow to the radiator.



Coolant Heater

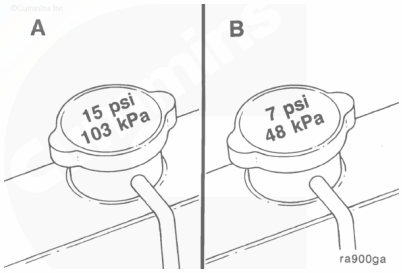
An optional coolant heater is available for engines operating in cold climates. A dedicated port in the cylinder block located adjacent to the lubricating oil cooler is available for the coolant heater.



Radiator Pressure Cap

The cooling system is designed to use a pressure cap to prevent boiling of the coolant. See the original equipment manufacturer's (OEM's) cooling system specifications for the correct radiator pressure cap for the application being serviced.

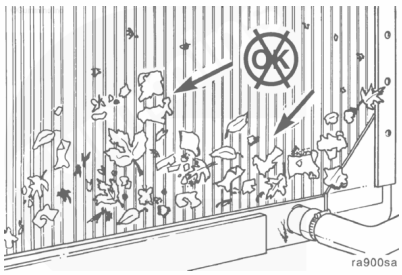
An incorrect or malfunctioning cap can result in the loss of coolant and an engine overheat condition.



Radiator

Air forced through the fins of the radiator by a fan cools the coolant flowing through the radiator. Environmental debris (such as paper, straw, lint, and dust) can obstruct the fins and reduce the flow of air, which will reduce the cooling effect of the radiator.

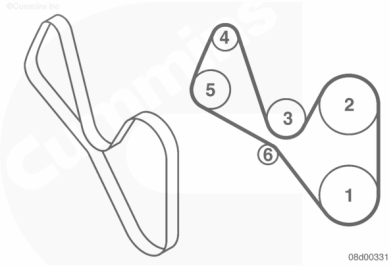
For maintenance, removal and/or installation of the radiator, see equipment manufacturer service information.



Drive Belt (Cooling Fan, Water Pump, Alternator)

The drive belt is an 8 rib design commonly referred to as a “serpentine” belt and is used to drive the various front engine mounted accessories. A number of different drive belt arrangements are available to cover various applications. To

make sure the drive belt is routed correctly upon installation, make a diagram of the cooling fan belt routing prior to removing the belt, as shown in the illustration. The cooling fan belt routing typically consists of the following components, but could possibly **not** include all of them:

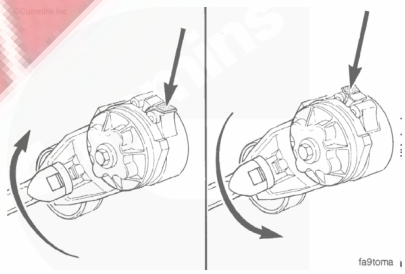


1. Crankshaft pulley/vibration damper
2. Fan pulley
3. Water pump pulley
4. Alternator pulley
5. Refrigerant compressor pulley
6. Belt tensioner pulley
7. Idler pulley(s) (not shown).

Note : Some engine driven belts are installed/supplied by the vehicle's OEM. See equipment manufacturer service information for removal and installation procedures.

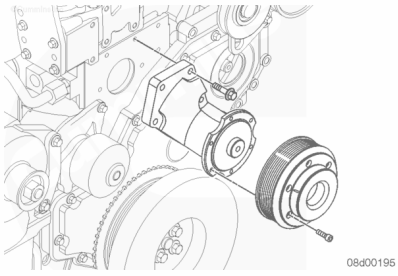
Fan Belt Tensioner

An automatic belt tensioner is used to maintain proper drive belt tension. The tensioner maintains proper drive tension through an internal spring. The belt tensioner mounting location varies depending on the front accessory drive configuration. The belt tensioner winds in the direction that the spring tang is bent over the tensioner body. To loosen the tension on the belt, rotate the tensioner to wind the spring tighter.



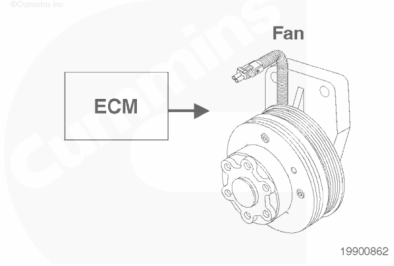
Fan Hub

The fan hub is mounted at the front of the engine to support the cooling fan and drive belt configuration. The fan hub is typically a cast iron mount that houses a pulley/bearing assembly. The type and location of the fan hub is dependent on the front accessory drive configuration.



Cooling Fan Clutch

Some applications utilize a cooling fan clutch to control cooling fan operation. All fan clutches can be controlled by the engine electronic control module (ECM). The ECM monitors coolant temperature and intake manifold temperature to determine when to engage the cooling fan. Some applications have additional sensors monitored by the

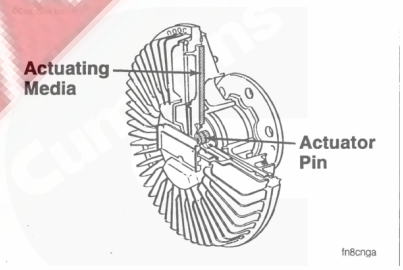


ECM for fan control (for example, air conditioner pressure and transmission temperature). There are various fan clutch types, such as:

- Air engaged
- Air disengaged
- Electric
- Viscous
- ON-OFF.

See the manufacturer's service manual to determine fan clutch type. The ECM is capable of using either a zero (“0”) VDC or +12/24 VDC signal to engage the fan clutch. The exact enable logic can be selected in the Features and Parameters section of INSITE™ electronic service tool. See equipment manufacturer service information for fan clutch troubleshooting and repair information.

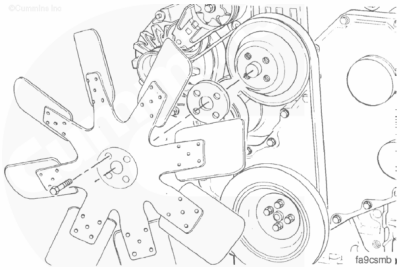
Some applications use viscous fan drives that are activated by built-in sensor that monitors air temperature.When the air temperature reaches a specific level, depending on the temperature setting of the sensor used, the temperature-sensing control moves an actuator that allows viscous fluid to engage the fan drive and increase the fan speed.



Cooling Fan

The cooling fan is typically mounted at the front of the engine and is driven by the drive belt. Some cooling fans, depending on the application, can be mounted off the engine, as in the case for side mount radiators.

The cooling fan is supplied by the OEM. See equipment manufacturer service information for fan troubleshooting and repair information.



⚠ CAUTION ⚠

Never operate the engine without a thermostat. Without a thermostat, the coolant will not flow to the radiator and the engine will overheat.

Cooling System Flow

Cylinder Block and Water Pump

Through the water/coolant inlet connection, engine coolant is drawn into an integral water pump cavity machined into the block. The cylinder block mounted water pump is belt driven and pressurizes the coolant before flowing into the cylinder block water jacket. The coolant first flows around the lubricating oil cooler plates and enters the lower water manifold before passing through the water jacket cavity around the cylinder liners. Coolant flows around the cylinders and between the inner cylinder bores. From the cylinder block water jacket, the coolant flow continues through holes around and between each cylinder in the cylinder block combustion deck to the cylinder head.

Cylinder Head and Gasket

From the cylinder block, the coolant flows into the cylinder head through orifices in the cylinder head gasket. The orifices in the cylinder head gasket control the coolant flow from the cylinder block to the cylinder head. Coolant flow continues around the valve guide and injector areas before continuing to the exhaust side of the cylinder head, then into the upper water manifold and back to the integral thermostat housing.

Thermostat Bypass

Before the engine reaches thermostat opening temperature, a bypass port is open to allow engine coolant to flow back to the inlet of the water pump. Until the thermostat opens, engine coolant is continuously recirculated through the engine **only**. Once the engine reaches the thermostat opening temperature, the thermostat opens, allowing the coolant to flow to the radiator. This action also closes the bypass passage to the water pump.

Variable Geometry Turbocharger

From a port in the cylinder block adjacent to the lubricating oil cooler, coolant is supplied from the cylinder block to the bearing housing of the variable geometry turbocharger through an external coolant hose. Coolant flow internally circulates through the variable geometry turbocharger bearing housing and actuator. Coolant flow exiting the variable geometry turbocharger is directed to the cylinder block through an external coolant hose.

EGR Cooler

From a port in the cylinder block, coolant is supplied to the EGR cooler through an external coolant tube. Coolant flows through the EGR cooler parallel to the EGR gas flow toward the front of the engine. Coolant flow exiting the EGR cooler is directed to the water/coolant inlet connection through an external coolant tube.

The EGR cooler and turbocharger are equipped with a de-aeration port that is connected to the OEM coolant top tank. This port constantly flows coolant to the top tank to make sure air is **not** trapped in the cooling system and plumbing during coolant fill and operation.

Selective Catalytic Reduction System

The aftertreatment diesel exhaust fluid dosing valve and tank are cooled and heated respectively by the engine coolant. Use the following procedure for further information on the aftertreatment dosing valve or see equipment manufacturer service information. Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html)

ANADOLU ISUZU AFTER SALES

General Information

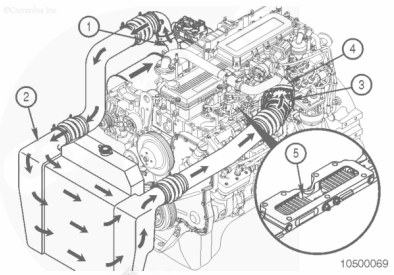
On an engine with exhaust gas recirculation (EGR), the air intake system and exhaust system components work together to provide the correct amount of intake charge flow into the engine. This overview will cover the major components of the intake system.

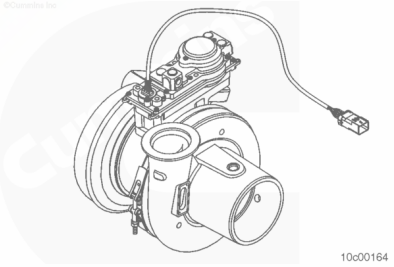


1. Turbocharger
2. Chargeair cooler
3. Engine intake throttle actuator
4. Air intake connection
5. Air intake manifold/cold starting aid.

The exhaust system components are covered in Exhaust System - Overview. Refer to Procedure 011-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-011-999.html)

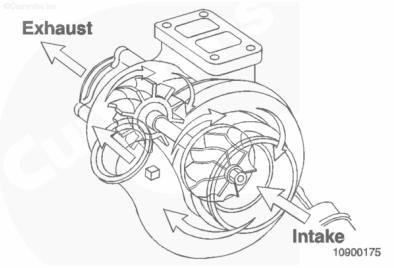
Turbocharger

The turbocharger is a variable geometry turbocharger (VGT) with:



- Serviceable actuator mounted to the bearing housing of the turbocharger
- Speed sensor in the bearing housing to monitor turbocharger operation
- Water-cooled bearing housings (in addition to oil lubrication).

The turbocharger uses exhaust gas energy from the engine to turn the turbine wheel.



The turbine wheel drives the compressor wheel through a common shaft.

The impellers on the compressor wheel draw intake air through the original equipment manufacturer (OEM) air filter and inlet plumbing into the compressor housing of the turbocharger.

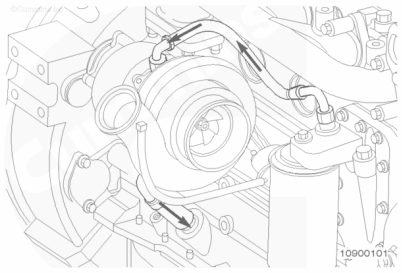
The air is then pressurized by the compressor wheel before being delivered to the charge air cooler.

ANADOLU ISUZU SPARE PARTS SALES

Engine lubricating oil is used to lubricate the bearings and provide some cooling for the turbocharger.

The lubricating oil supplied to the turbocharger through the supply line is at the engine oil operating pressure.

A return line connected to the bottom of the turbocharger routes the lubricating oil back to the engine lubricating oil pan.



The turbine, compressor wheel, and shaft are supported by two rotating bearings in the bearing housing.

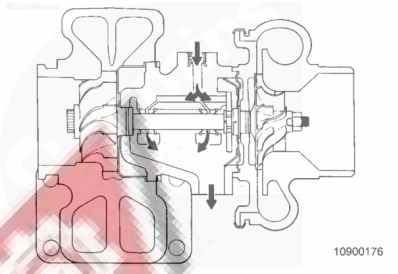
Passages in the bearing housing direct filtered, pressurized engine oil to the shaft bearings and thrust bearings.

The oil is used to lubricate and cool the rotating components.

Oil then drains from the bearing housing to the engine sump, through the oil drain line.

An adequate supply of good, filtered oil is very important to the life of the turbocharger.

Make sure a high quality oil is used and the oil and oil filter are changed according to maintenance recommendations.



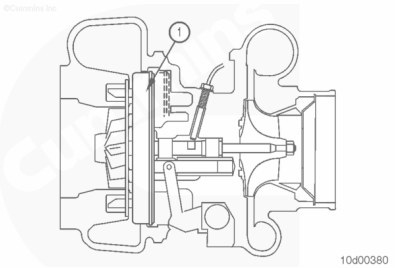
The actuator mounted on the turbocharger is used to control a sliding nozzle ring (1) internal to the turbine housing of the turbocharger.

The position of the sliding nozzle ring is controlled by the engine control module (ECM) through a data link connection.

The position of the sliding nozzle ring, internal to the VGT, allows for control of turbine wheel speed and exhaust flow through the turbocharger.

This allows for control of:

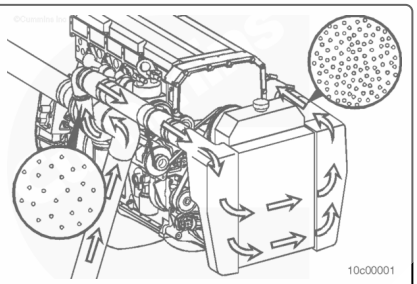
- Exhaust pressure
- Turbocharger compressor wheel speed
- Exhaust outlet temperatures.



Charge Air Cooler

Automotive engines use a chassis-mounted charge air cooler to improve engine performance.

This system also uses large diameter piping to transfer the air from the engine turbocharger to the charge air cooler, then returns the air from the charge air cooler to the engine



intake manifold.

As the intake air is compressed by the turbocharger, the air temperature increases.

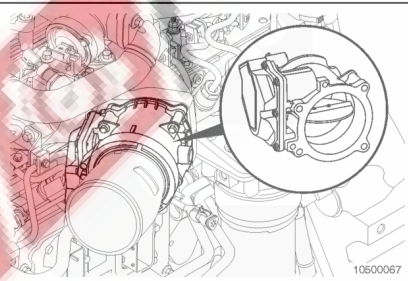
This heated air is then passed through the charge air cooler, which cools the air.

Cool air is more dense, which allows more air to be compressed into the cylinder, yielding higher combustion efficiency.

Note : The long-term integrity of the charge air cooling system is the responsibility of the vehicle and component manufacturers.

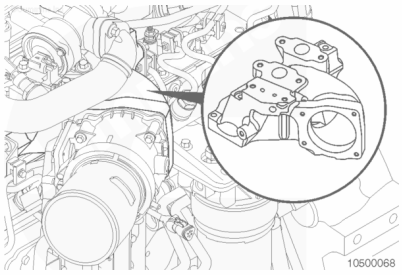
Engine Intake Throttle Actuator

The engine intake throttle actuator attaches to the air intake connection. It is used in combination with the EGR valve to control the flow of compressed and cooled air and cooled exhaust gases into the air intake connection.



Air Intake Connection

The air intake connection attaches to the top of the air intake manifold. It mixes compressed and cooled air from the charge-air plumbing with the cooled exhaust gases from the EGR cooler, then directs the mixture into the air intake manifold.



Air Intake Manifold/Cold Starting Aid

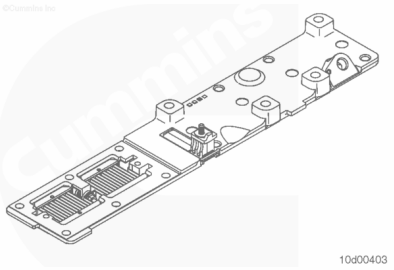
An air intake manifold with an integral cold starting aid is used to cover the intake portion of the cylinder head.

The integral cold starting aid is a single element intake air heater used to pre-heat the intake air under cold ambient conditions.

The ON/OFF operation of the intake air heater is controlled by the engine ECM.

The ECM controls a single OEM supplied relay which provides power for the intake air heater when commanded.

Note : The cold starting aid is **not** a serviceable part. If the cold starting aid has cracked, broken, or melted elements, the engine air intake manifold **must** be replaced. Refer to Procedure 010-023 in Section 10.



(/qs3/pubsys2/xml/en/procedures/425/425-010-023.html)

Intake Air Flow Description

Air Cleaner

Air first flows through the OEM supplied air cleaner, where foreign material and debris are removed from the air.

Air flows first through the Cummins Inc. supplied air cleaner element (direct flow) where foreign material and debris are removed from the air. Refer to Procedure 010-031 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-031.html)

Air Inlet Piping and Turbocharger

Air then flows through the OEM supplied air inlet piping to the turbocharger compressor inlet. Once air reaches the compressor wheel, it is compressed to a level determined by the ECM. The ECM regulates the level of pressure (boost) by using the electronically controlled variable geometry turbocharger. The electronic controls on the turbocharger adjust the compressor wheel speed, and thus boost, to meet the commands of the ECM.

Charge Air Cooler

After the air flows through the turbocharger compressor outlet, it gets passed through an OEM supplied charge air cooler to remove some of the heat generated by compressing the air. By lowering the temperature of the air, its density is increased. The increased density of the air allows the engine to maintain a higher level of performance.

Air Intake Connection Adapter, Engine Intake Throttle Actuator, Air Intake Connection, and Air Intake Manifold

From the outlet of the charge air cooler compressed and cooled air flows into the air intake connection adapter. The air intake connection adapter allows different OEM arrangements to plumb to the engine. Compressed and cooled air then flows through the engine intake throttle actuator and into the air intake connection. The air intake connection mixes the compressed and cooled air with the cooled exhaust gases then directs the mixture into the air intake manifold where the air is distributed to the cylinders for combustion.

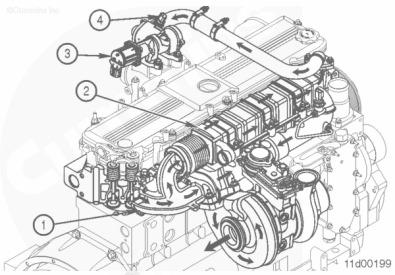
AFTER SALES

General Information

On an engine with exhaust gas recirculation (EGR), the air intake system and exhaust system components work together to provide the correct amount of intake charge flow into the engine. This overview covers the major components of the exhaust system.

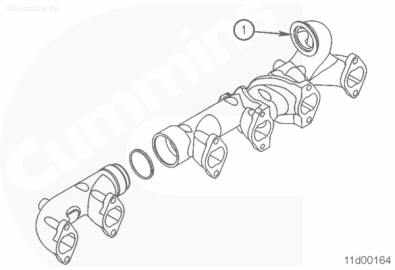


1. Exhaust manifold and seal
2. EGR cooler
3. EGR valve
4. Exhaust pressure sensor and mounting.

Note : Use the following procedure for intake air components. Refer to Procedure 010-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-010-999.html)

This overview also covers the aftertreatment system components located off the engine in the exhaust system.

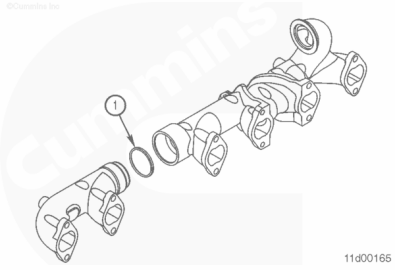
The exhaust manifold is a two-piece design with a sealed slip-joint to allow for thermal expansion.



Depending on the application, the exhaust manifold used can vary in order to locate the turbocharger in various positions, as required by the application.

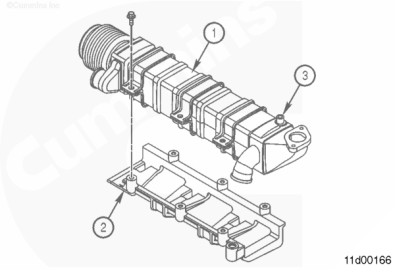
The exhaust manifold has an additional port that connects to the EGR cooler inlet (1).

The exhaust manifold sections are sealed by a metallic exhaust seal (1), which is replaceable in the event the seal malfunctions and leaks exhaust gas.



The seal requires a special installation tool to be properly installed to the exhaust manifold.

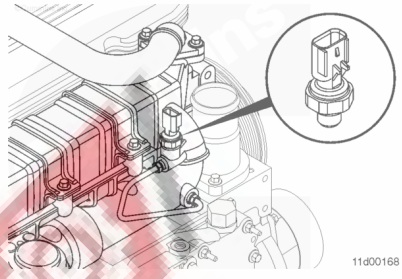
The EGR cooler (1) cools the exhaust gases flowing to the EGR valve. The EGR cooler is mounted above the exhaust manifold and is supported by the EGR cooler mounting bracket (2) attached to the cylinder head.



Because the EGR valve is mounted after the EGR cooler, the EGR cooler is under the same exhaust temperatures and pressures as the exhaust manifold.

The EGR cooler has a coolant vent (3) near the exhaust outlet of the EGR cooler. This vent prevents air from being trapped in the cooler during coolant filling and engine operation by continuously flowing coolant to the top tank of the vehicle cooling system.

Exhaust pressure in the exhaust manifold (which determines the position of the variable geometry turbocharger and the EGR valve) is measured by an exhaust pressure sensor. To maximize the longevity of the exhaust pressure sensor, the sensor does **not** mount directly in the exhaust manifold. The exhaust pressure sensor is connected by a tube to the exhaust manifold and is located on the EGR cooler coolant outlet connection, for additional cooling of the sensor.

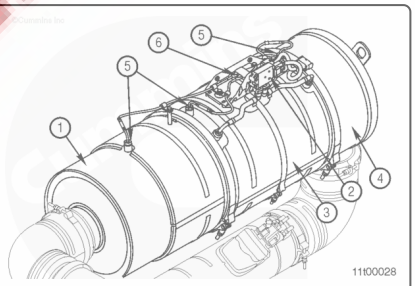


The aftertreatment diesel particulate filter system is used to reduce particulate emissions and is composed of six main components:

1. Aftertreatment inlet and aftertreatment diesel oxidation catalyst
2. Aftertreatment diesel particulate filter differential pressure sensor
3. Aftertreatment diesel particulate filter
4. Aftertreatment outlet
5. Aftertreatment exhaust gas temperature sensor probes
6. Aftertreatment diesel particulate filter temperature sensor interface module.

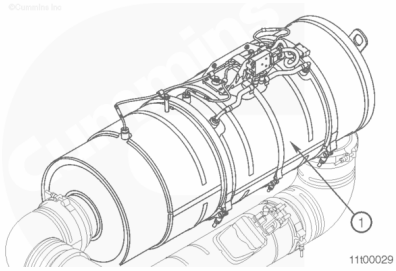
Note : In some applications, the aftertreatment diesel oxidation catalyst can be contained within the inlet section of the aftertreatment system.

Note : The temperature sensor module and temperature sensor probes are **not** serviceable separately and must be replaced as an assembly.



Passive regeneration occurs when the exhaust temperatures are naturally high enough to oxidize the soot collected in the aftertreatment diesel particulate filter (1) faster than the soot is collected.

Passive regeneration typically occurs when the temperature of the aftertreatment diesel particulate filter is above 316°C [600°F]. This occurs during highway driving or driving with

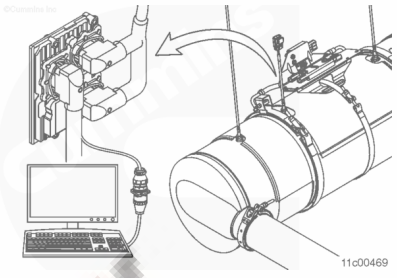


ANADOLU ISUZU Limited Sales

heavy loads.

Since passive regeneration occurs naturally, it is considered to be normal engine operation. No fuel is added to the exhaust stream during passive regeneration.

Active regeneration occurs when passive regeneration is unable to oxidize the soot faster than it is collected in the diesel particulate filter.



Active regeneration occurs when the exhaust temperatures are **not** naturally high enough to oxidize the soot collected in the aftertreatment diesel particulate filter faster than it is collected.

Active regeneration requires assistance from the engine in order to increase the exhaust temperature. This is typically done by injecting a small amount of diesel fuel into the exhaust stream (called aftertreatment injection) which is then oxidized by the aftertreatment diesel oxidation catalyst. The oxidation of this additional fuel creates the heat needed to regenerate the aftertreatment diesel particulate filter.

For active regeneration to occur, the engine control module (ECM) **must** detect that the aftertreatment diesel particulate filter restriction has reached a specified limit. Once this limit is reached, the engine will alter its operation in order to create exhaust temperatures high enough to actively regenerate the aftertreatment diesel particulate filter.

Aftertreatment injection requires that temperatures in the aftertreatment system reach approximately 288°C [550°F]. At this temperature and above, the small quantities of fuel injected into the exhaust will properly oxidize across the aftertreatment diesel oxidation catalyst creating the additional heat required to actively regenerate the aftertreatment diesel particulate filter.

During active regeneration, the engine ECM monitors the exhaust temperatures before and after the aftertreatment diesel particulate filter and maintains the temperatures in a range of approximately 482 to 649°C [900 to 1200°F]. The quantity of fuel used for aftertreatment injection will vary as the temperature is controlled within these limits.

The temperatures achieved during active regeneration are typically higher than those achieved during passive regeneration. The conversion of soot to carbon dioxide occurs much faster as temperatures increase.

A typical active regeneration event will take approximately 20 to 40 minutes to complete while the vehicle is operating. The vehicle operator can notice additional turbocharger noise during this time, along with an illuminated high exhaust temperature lamp.

The frequency at which an engine will require an active regeneration varies greatly from application to application. In general, vehicles with a low vehicle speed, such as urban vehicles, or a low-load duty cycle, will require more active regeneration events than a heavily loaded vehicle or a vehicle with a highway speed duty cycle.

The engine ECM also contains a time-based feature for active regenerations which is used to verify correct aftertreatment operation when the vehicle duty cycle is typically high enough that active regeneration events are **not** necessary.

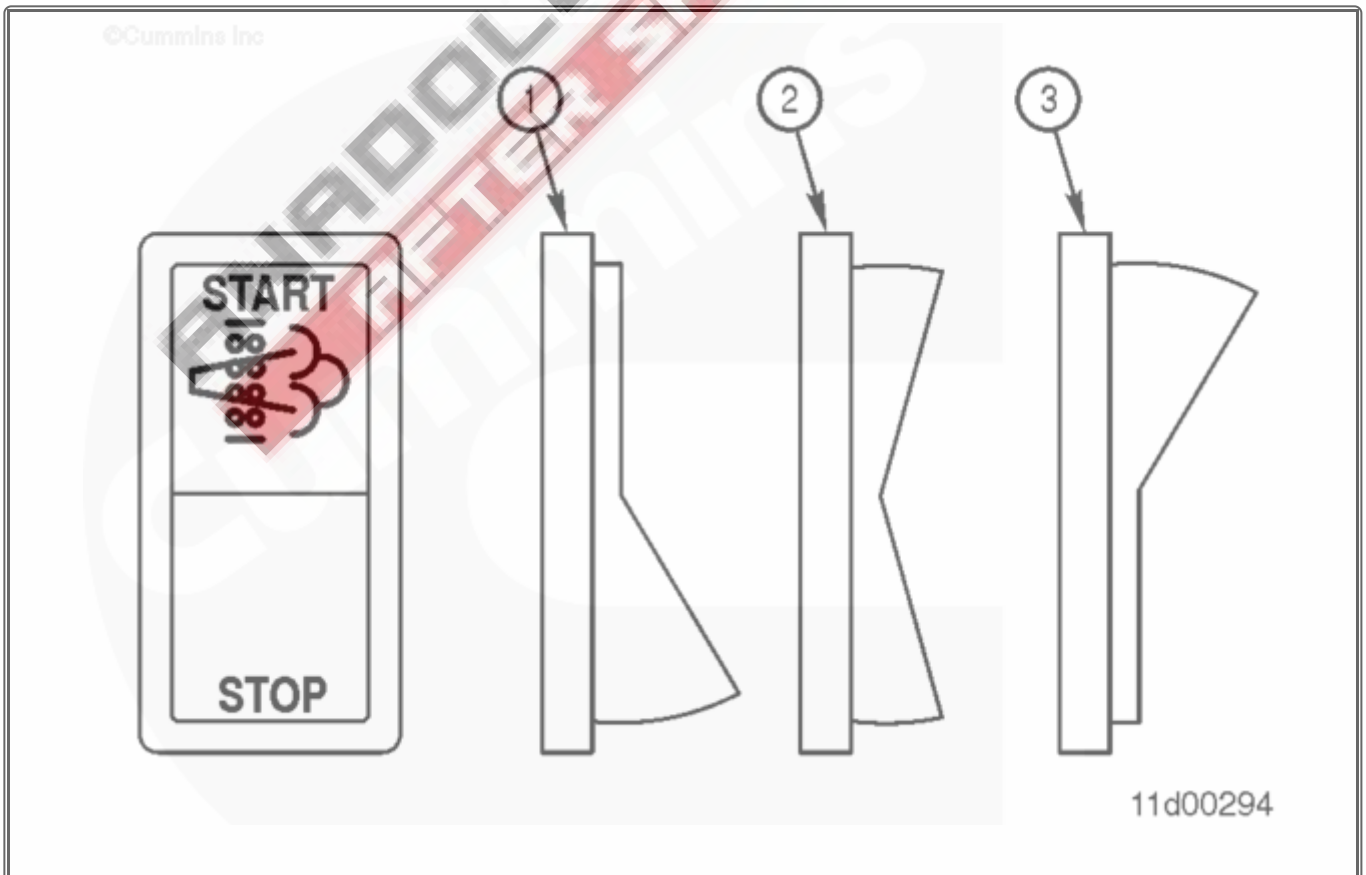
If the engine has **not** completed an active regeneration within the last 24 hours of operation, the engine ECM will call for a time-based active regeneration event.

The 24 hour timer resets each time the ECM detects an active regeneration event has completed.

Under some operating conditions, such as low speed, low load, or stop-and-go duty cycles, the engine may **not** have enough opportunity to regenerate the aftertreatment diesel particulate filter during normal vehicle operation. When this occurs, the engine illuminates the aftertreatment diesel particulate filter lamp to inform the vehicle operator assistance is required, typically in the form of a stationary (parked) regeneration.

Stationary (parked) regeneration is a form of active regeneration initiated by the vehicle operator when the vehicle is **not** moving.

Use the following procedure for more information on stationary (parked) regeneration. Refer to Procedure 014-016 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-016.html)



The equipment manufacturer installed two switches that control aftertreatment functions: the start switch and the permit switch.

The start switch (known as the Diesel Particulate Filter Regeneration Start Switch in INSITE™ electronic service tool) is used to start a manual (non-mission) regeneration. The equipment manufacturer can also reference this switch as a manual (non-mission) regeneration switch, start switch, or parked regeneration switch.

The permit switch (known as the Diesel Particulate Filter Permit Switch in INSITE™ electronic service tool) is used to allow the equipment operator to disable active regeneration, if necessary. The equipment manufacturer can also reference this switch as an inhibit switch, stop switch, or disable switch.

Use the following procedure for switch operation and troubleshooting. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)

The Minimum Vehicle Speed for Automotive Mobile Regeneration parameter in INSITE™ electronic service tool allows the vehicle manufacturer to program a minimum vehicle speed at which active regeneration is allowed.

This parameter is controlled by the vehicle manufacturer and can be protected by an original equipment manufacturer (OEM) password. Do **not** change the value of this parameter without written consent of the vehicle manufacturer.

This parameter can be set between 0 to 40 kph [0 and 25 mph].

When this parameter is set to zero mph, the engine is allowed to activate an active regeneration event at any vehicle speed.

If the engine needs to initiate an active regeneration event, but the vehicle speed is zero and the engine is at low idle speed, the engine will **not** immediately enter an active regeneration event. The ECM will wait until the engine speed increases to begin the active regeneration event. Once the active regeneration begins, and the exhaust temperatures have increased, the engine will maintain the active regeneration event, even if the vehicle speed returns to zero and the engine speed returns to idle.

When the vehicle speed is greater than zero and the engine speed is above idle speed, an active regeneration event can occur at any time.

When this parameter is set to any speed other than zero mph, the triggers for active regeneration change.

In order for an active regeneration event to start, the vehicle speed **must** exceed 64 kph [40 mph], regardless of minimum vehicle speed parameter setting. Once the vehicle speed exceeds 40 mph, an active regeneration event can begin.

Once the vehicle speed has exceeded 64 kph [40 mph] and the active regeneration event has started, the active regeneration event will continue until the vehicle speed drops below the minimum speed parameter. Once the vehicle speed drops below the minimum speed parameter, the active regeneration stops.

The vehicle **must** once again exceed 64 kph [40 mph] to begin the active regeneration event again.

If a vehicle has a non-zero minimum vehicle speed for mobile active regeneration, and has a low vehicle speed or stop-and-go duty cycle (such as a transit bus, delivery vehicle, school bus), the engine may **not** have enough opportunity to perform or complete an active regeneration event. An engine in this situation can illuminate the diesel particulate filter lamp on a frequent basis, signaling the need for a stationary regeneration.

The Active Regeneration in power takeoff (PTO) and Remote Modes parameter in INSITE™ electronic service tool allows the vehicle manufacturer to allow/disallow regeneration when a vehicle is in a PTO or remote operating mode.

This parameter is controlled by the vehicle manufacturer and can be protected by an OEM password. This parameter can be set to enable or disable. Do **not** change the value of this parameter without written consent of the vehicle manufacturer.

When this parameter is set to Disable, an active regeneration event can **not** occur when the vehicle is in a PTO or remote operating mode. Certain applications (such as a fire truck, delivery vehicle, and transit bus) can assume a PTO or remote operating state many times during normal operation and may **not** have enough opportunity to perform or complete an active regeneration event. An engine in this situation can illuminate the diesel particulate filter lamp on a frequent basis, signaling the need for a stationary regeneration. Consult the vehicle manufacturer for information regarding specific engine operating states.

The aftertreatment warm-up feature activates during periods of extended idle time.

The purpose of this feature is to increase the temperature of the aftertreatment system to remove any water condensation built up during the idle time.

After the ECM detects the exhaust temperature entering the aftertreatment system has been below 150°C [302°F] for 4 hours, the ECM automatically increases the engine speed to between 1000 and 1100 rpm for approximately 10 minutes.

For the aftertreatment warm-up feature to activate, the following conditions **must** be met:

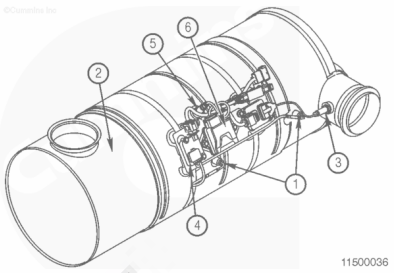
- The clutch pedal is released.
- The brake pedal is released.
- The transmission is in neutral or park.
- PTO or remote PTO is off.
- The vehicle speed is zero mph.
- The accelerator pedal is released.

The aftertreatment warm-up feature is similar to stationary regeneration because it uses the same engine speeds and inputs. However, the aftertreatment warm-up feature does **not** require aftertreatment injection, as it does **not** require the higher temperatures needed during stationary (parked) regeneration.

The aftertreatment warm-up feature is similar to manual (non-mission) regeneration because it uses the same engine speeds and inputs. However, the aftertreatment warm-up feature does **not** require aftertreatment injection, as it does **not** require the higher temperatures needed during manual (non-mission) regeneration.

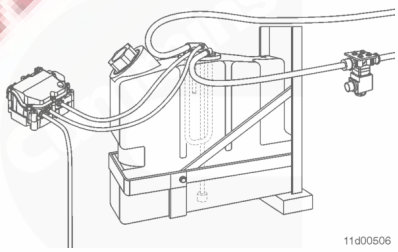
Increasing the exhaust temperature entering the aftertreatment system to above 150°C [302°F] for approximately 10 minutes allows the aftertreatment warm-up to deactivate. This can be done by allowing the engine to operate in this condition for approximately 10 minutes or by driving the vehicle.

Aftertreatment selective catalyst reduction (SCR) system is designed to reduce the nitrogen oxide (NOx) emissions from the engine exhaust into nitrogen and water. This is accomplished by two main entities: the aftertreatment SCR dosing system and the aftertreatment SCR exhaust system.

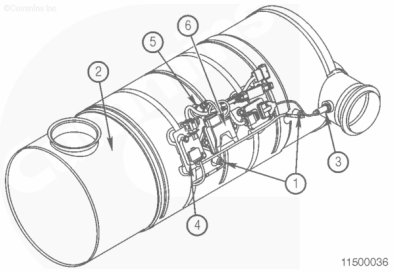


1. The aftertreatment SCR exhaust system mixes and converts the diesel exhaust fluid (DEF) to eliminate unwanted gases from being released in the atmosphere. This system includes the aftertreatment SCR catalyst, aftertreatment decomposition tube, and any ancillary tubing (elbows, etc) involved.

2. The aftertreatment SCR dosing system monitors and injects DEF into the exhaust stream. The SCR dosing system is comprised of the aftertreatment DEF dosing valve, aftertreatment DEF dosing unit, aftertreatment DEF tank, and aftertreatment DEF lines.



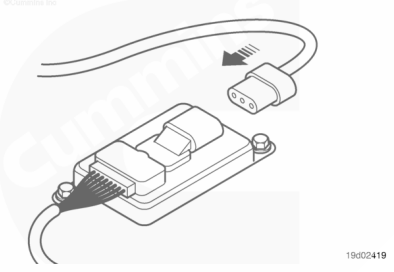
The aftertreatment SCR is designed to reduce NOx emissions from the engine using these main components:



1. Aftertreatment SCR intake/outlet temperature sensor probes
2. Aftertreatment SCR catalyst
3. Aftertreatment outlet NOx sensor
4. Aftertreatment SCR catalyst temperature sensor interface module.

Note : The temperature sensor module and temperature sensor probes are **not** serviceable separately and **must** be replaced as an assembly.

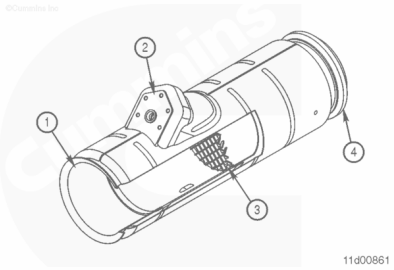
During initial cold start up the engine will go into SCR warm up condition. This condition will sound and act like an active diesel particulate filter regeneration. The SCR catalyst will need to have a temperature of over 150°C [302°F] degrees in order to properly convert NOx in the exhaust stream.



ANADOLU ISUZU PARTS SALES

The NOx sensors at the outlet of the turbo and SCR catalyst will monitor the NOx output of the exhaust system and relay the information back to the ECM.

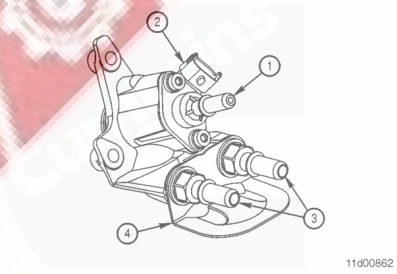
Aftertreatment Decomposition Tube:



The DEF dosing valve is mounted to the decomposition tube. The decomposition tube contains a mixer to help DEF mists distribute evenly in the exhaust stream to convert DEF into ammonia.

1. Aftertreatment decomposition tube inlet
2. Aftertreatment DEF dosing valve mounting
3. Aftertreatment decomposition tube mixer
4. Aftertreatment decomposition tube outlet.

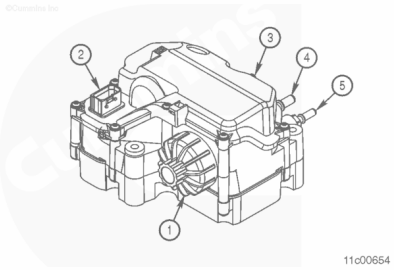
Aftertreatment Diesel Exhaust Fluid Dosing Valve:



The aftertreatment DEF dosing valve is controlled by the ECM and sprays the correct amount of DEF into the exhaust stream. Engine coolant is supplied to the DEF dosing valve to keep the valve cool and operable.

1. DEF intake port
2. Electrical connection to the OEM harness
3. Coolant ports
4. Heat shield.

Aftertreatment Diesel Exhaust Fluid Dosing Unit:



The aftertreatment DEF dosing unit is the pumping mechanism of the dosing system. The aftertreatment DEF dosing unit draws DEF through its suction port and pressurizes it. The aftertreatment DEF dosing unit then filters the DEF which is eventually sprayed into the exhaust stream via the pressure port. Any unused DEF is returned to the DEF tank through the return port.

The main components of the aftertreatment DEF dosing unit:

1. Aftertreatment DEF dosing unit filter (internal) and cap
2. Electrical connector
3. Inlet port
4. Backflow port
5. Outlet port.

Aftertreatment Diesel Exhaust Fluid Tank:

ANADOLU ISUZU AFTER SALES

The DEF tank is designed to store DEF and report DEF tank level and DEF tank temperature to the ECM.

If the tank level becomes too low, it will set fault codes followed by a power derate. See equipment manufacturer service information.

If the tank is filled with the incorrect fluid, (anything other then DEF), the aftertreatment system will fail to operate correctly. A fault will become active and power derates will follow.

See the appropriate Owner's Manual and/or Operation and Maintenance Manual in Section V for DEF specifications.

See Service Bulletin, Diesel Exhaust Fluid Specifications for Cummins® Selective Catalytic Reduction Systems, Bulletin 4021566 (/qs3/pubsys2/xml/en/bulletin/4021566.html).

DEF tanks will vary in size and shape. For further details, see equipment manufacturer service information.

Aftertreatment Diesel Exhaust Fluid Lines:

The aftertreatment DEF lines carry the DEF to and from the DEF tank, aftertreatment DEF dosing unit, and aftertreatment DEF dosing valve.

DEF will fill the lines during a prime or operating state and then be removed in a purge state to prevent freezing of the lines.

DEF line connectors, length, and design will vary by vehicle manufacturer. The DEF lines incorporate electrically heated elements. See the vehicle manufacturer owner's manual for further details.

The SCR system is comprised of many components, but requires a minimal amount of servicing or driver intervention. The SCR system is comprised of four main states: priming, dosing, purging, and heating.

Priming State

- Once the SCR reaches a temperature of 150°C [302°F] the ECM will command the aftertreatment DEF dosing unit to start its priming process. The aftertreatment DEF dosing unit will draw DEF from the DEF tank, pressurize the DEF, and then filter the DEF to the aftertreatment DEF dosing valve. The aftertreatment DEF dosing valve will open and close to rid any air from the system. Once the system is able to build up pressure and has removed most of the air bubbles from the DEF lines, the aftertreatment DEF dosing system is capable of dosing.

Dosing State

- The aftertreatment DEF dosing valve will open and spray DEF in the exhaust stream when the engine ECM aftertreatment calibration limits are met. The DEF will then be chemically altered by the aftertreatment SCR catalyst to clean the exhaust gases. As long as the dosing system is in the dosing state, the aftertreatment DEF dosing unit will continue to run regardless if the aftertreatment DEF dosing valve is or is **not** spraying DEF. DEF dosing rates are dependent on vehicle duty cycle. The dosing rates are **not** necessarily constant under most duty cycles. The aftertreatment DEF dosing valve will pulse the demanded amount of DEF into the exhaust stream. Any DEF **not** used by the aftertreatment DEF dosing valve is returned to the DEF tank.

Purging State

- When a driver keys OFF, the dosing system will shut itself down with a purge cycle to prevent DEF from being left in the system, and in cold climates, potentially freezing. An audible click and pumping sound will be heard from the DEF dosing unit when it is in a purge cycle. The DEF dosing unit will slide its internal reverting valve and cause a change in the flow direction of the DEF. The DEF dosing unit will pull all the DEF out of the aftertreatment DEF dosing valve and pressure line, then return the unused DEF to the DEF tank. In this process the aftertreatment DEF dosing valve will open, eliminating the vacuum created in the lines for a more complete purge process. After a complete purge the majority of the system will be free of any remaining DEF. If the main power to the ECM is removed, via battery cut off or other means before the purging state is competed, an internal fault will be logged in the ECM. The incomplete purge counter can be viewed in INSITE™ electronic service tool.

Heating State

- DEF freezes at -11°C [12°F]. If a driver starts the engine in a cold climate, the dosing heating state will be activated. If the ambient air temperature sensor reads ambient conditions are below -4°C [25°F] the ECM will command the dosing system to go into the defrost state. The aftertreatment dosing unit will turn on its internal heater to defrost any remaining DEF inside it. The heated DEF lines will also be commanded on. If the DEF tank temperature drops below -5°C [23°F], the DEF tank coolant valve will be commanded open by the ECM. Engine coolant will flow though the tank to defrost the frozen DEF. The DEF dosing system will **not** prime until every component is completely defrosted. If ambient conditions continue to be cold after the system has primed, the ECM will command a maintenance heating feature to prevent the DEF dosing system from refreezing. This feature will cycle the heating on and off to the DEF lines, DEF tank, and aftertreatment DEF dosing unit.

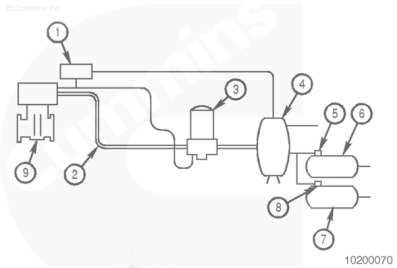
General Information

The compressed air system normally consists of an on-engine/gear-driven air compressor, air governor, air tanks, and all necessary plumbing.



10200070

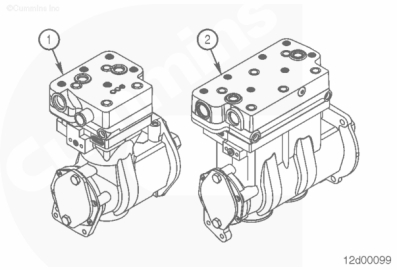
The components listed below are commonly used in a compressed air system:

1. Air governor
2. Discharge line
3. Air dryer
4. Supply tank
5. Check valve
6. Primary tank
7. Secondary tank
8. Check valve
9. Air compressor.

The engine is supplied with the air compressor and related coolant plumbing **only**. The remainder of the compressed air system is the responsibility of the vehicle manufacturer.

Air Compressor

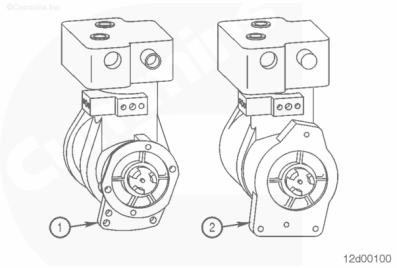
Several different air compressors are available for the engine covered in this manual. Both single cylinder (1) and two cylinder (2) modules are available.



12d00099

The air supplied to the air compressor is pressurized by the turborcharger on all models.

The air compressor can also be a low throughput torque or high throughput torque model, depending on the application.



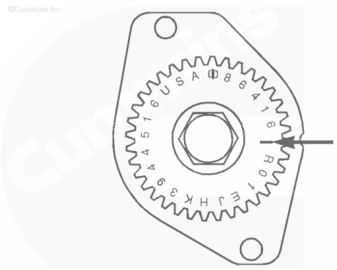
12d00100

Low throughput torque models have a Society of Automotive Engineers (SAE) A rear flange (1).

High throughput torque models have an SAE B rear flange (2).

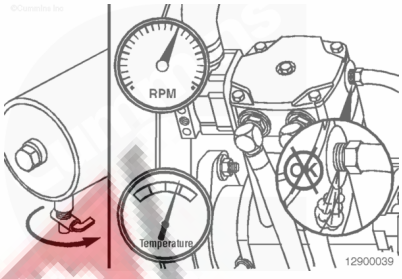
To make sure the air compressor does **not** contribute to engine vibrations, when installed, the air compressor **must** be properly timed on the engine.

ANADOLU ISUZU
WEB SALES



12800057

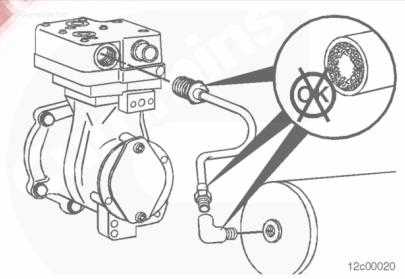
The key factor which determines the reliability and durability of an air compressor in an application is the amount of time the air compressor is supplying air during the vehicle/machine operation, known as the duty cycle of the air compressor.



12900039

Air compressors are **not** designed to pump continuously and will generate a lot of heat when pumping, which is dissipated during the time the compressor is **not** pumping (called the unloaded operation).

Compressed air system maintenance/servicing can help minimize air compressor duty cycle and ensure reliability and durability of the air compressor. These item include but are **not** limited to:



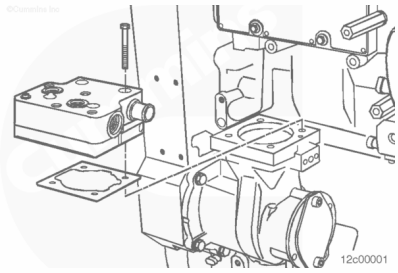
12c00020

1. Find and stop all leaks in the system. Air leaks can double or triple operating duty cycles. Close attention to correcting air system leaks is critical.
2. Checking the air compressor exhaust port, discharge line, and fittings for carbon build up. If the carbon buildup is greater than 1.6 mm [0.06 in], clean or replace as necessary.
3. Check the air lines and fittings between the outlet port of the air dryer and the first tank after the air dryer for any water or oil. The tank should be dry. If oil is present, replace the dryer desiccant and clean the downstream system and components as required.

See equipment manufacturer service information for the vehicle for maintenance and service information for the compressed air system. For air compressor specific maintenance, see the Operation and Maintenance and/or Owner's manual for the engine being serviced.

Air Compressor Cylinder Head

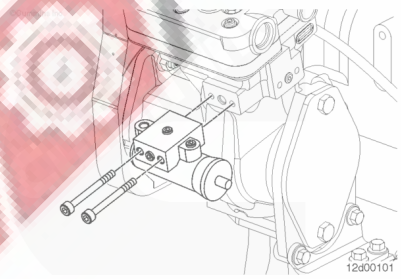
The air compressor cylinder head is cooled by engine coolant. The cylinder contains intake and exhaust valves to regulate air flow into and out of the cylinder head.



Most air compressor cylinder heads can be serviced without removing the compressor from the engine. This manual covers servicing of the cylinder head with the compressor installed on the engine. If there is internal damage to the air compressor, the air compressor **must** be replaced.

Prior to removing the air compressor cylinder, make sure to check if replacement parts are available. Some air compressor cylinder heads may **not** be able to be serviced separately from the air compressor.

The compressor operates continuously, but has a ”loaded" and ”unloaded" operating mode. The operating mode is controlled by a pressure activated air governor and the air compressor unloader assembly. The air governor can be located on the air compressor or remotely on the vehicle.



When the air system reaches a predetermined pressure, the governor applies an air signal to the unloader assembly, causing the unloader to either hold open or shut off the compressor intake valve. This causes compressed air to stop flowing into the compressed air system.

As the system is used, the pressure drops. At a predetermined pressure, the governor directs an air signal to the compressor unloader assembly, allowing the compressor to again pump compressed air into the system.

General Information

The engine test is a combination of an engine run-in and performance check. The engine run-in procedure provides an operating period that allows the engine parts to achieve a final finish and fit. The performance check provides an opportunity to perform final adjustments needed to optimize engine performance.

An engine test can be performed using **either** an engine dynamometer **or** a chassis dynamometer. If a dynamometer is **not** available, an engine test **must** be performed in a manner that simulates a dynamometer test.

Check the dynamometer before beginning the test. The dynamometer **must** have the capability to test the performance of the engine when the engine is operating at the maximum rpm and horsepower range (full power).

The engine crankcase pressure, often referred to as engine blowby, is an important factor that indicates when the piston rings have achieved the correct finish and fit. Rapid changes of blowby or values that exceed specification by more than 50 percent indicate something is wrong. The engine test **must** be discontinued until the cause has been determined and corrected.

General Information

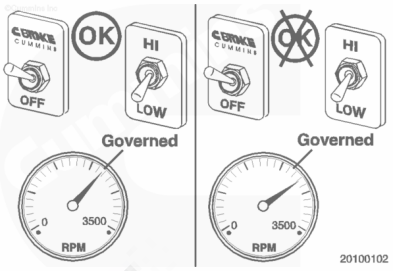
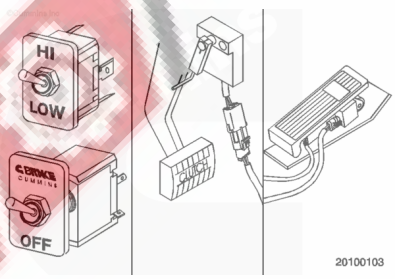
Note : The engine brake is comprised of two assemblies. The following instructions apply to both of the engine brake assemblies.

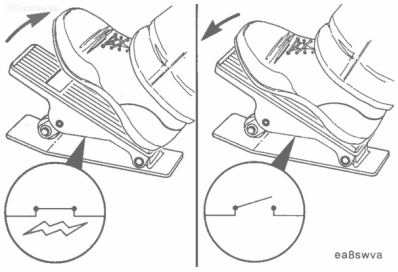


Engine brake controls consist of the following:

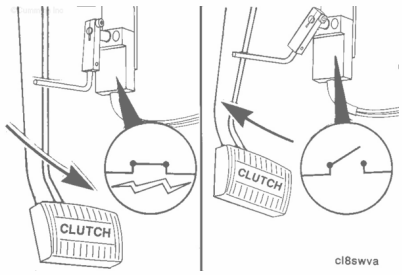
- ON/OFF switch
- Clutch switch
- Throttle sensor
- Two-position selector switch (optional).



The throttle sensor is part of the accelerator pedal assembly located in the cab, and will deactivate the engine brakes when depressed.

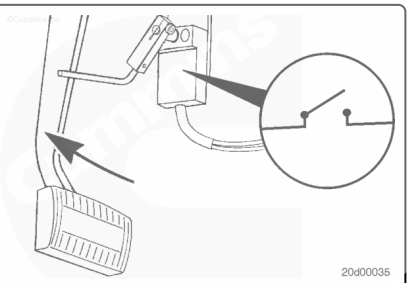


The clutch switch uses the motion of the clutch linkage to deactivate the engine brakes when the clutch pedal is depressed. Depressing the clutch while in cruise control will disengage the cruise control.



The service brake switch is attached to the service brake.

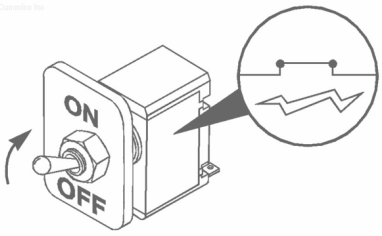
Applying the service brakes while in cruise control will disengage the cruise control and enable the engine brakes.



ANADOLU ISUZU
DEALER SALES

Note : Reference the appropriate pages in this section for specific information about engine brake operation under certain road conditions.

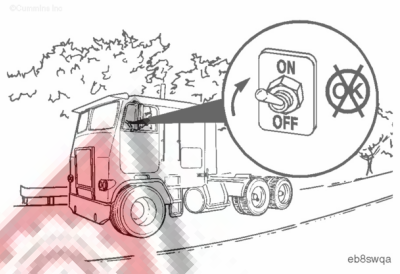
To activate the engine brakes, switch the ON/OFF switch to the ON position. Once activated, the operation of the engine brakes is fully automatic.



eb8swvc

⚠ WARNING ⚠

Do not use the engine brakes while bobtailing or pulling an empty trailer. With the engine brakes in operation, wheel lockup can occur more quickly when the service brakes are applied, especially on vehicles with single-drive axles.

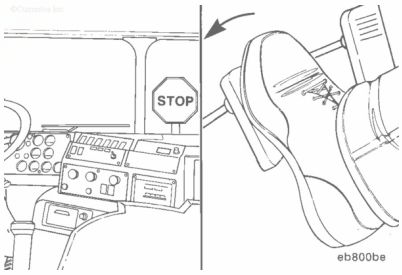


eb8swqa

Make sure the engine brakes are switched to the OFF position when bobtailing or pulling an empty trailer.

⚠ CAUTION ⚠

The engine harness is designed to assist vehicle service brakes in slowing the vehicle to a stop.

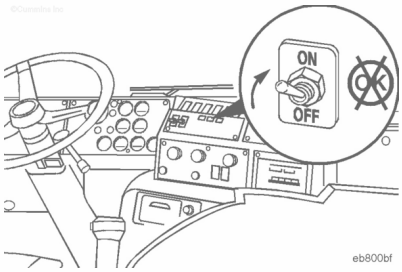


eb800be

Service brakes will be required to bring the vehicle to a stop.

⚠ CAUTION ⚠

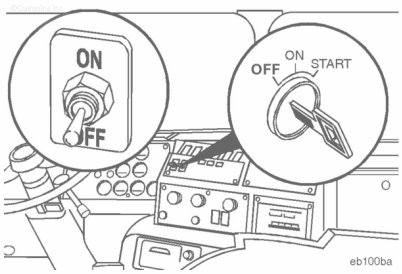
Do not use the engine brakes to aid clutchless gearshifting. This can cause the engine to stall or lead to engine damage.



eb800bf

⚠ CAUTION ⚠

Do not operate the engine if the engine brakes will not deactivate.



eb100ba

If the engine brakes will **not** shut off, shut off the engine immediately.

ANADOLU ISUZU

Last Modified: 25-Jul-2016

General Information

Cummins Inc. produces many engines that are electronically controlled. These engines have special diagnostic requirements for the engine control module (ECM) in the system. To interface with the ECMs, electronic service tools have been developed.

The recommended Cummins® electronic service tool or equivalent interfaces with the electronic engines via a data link. A data link provides a means of transmitting and sorting electric signals, and consists of special electronic circuitry and electrical harnesses. Connection points from electronic service tools are also part of the data link. An original equipment manufacturer (OEM) data link, if available, is provided by the OEM and consists of circuitry located in the OEM harness. An engine data link consists of circuitry located in the engine harness. Both engine and OEM data links alike are defined by standards written by the Society of Automotive Engineers (SAE). Cummins Inc. uses two such standards for electronic service tools. One is a combination of SAE J1587 and SAE J1708 and the other is SAE J1939. The J1939 data link is described in more detail in Procedure 019-165 in the appropriate engine service manual. The J1587/J1708 data link is described in more detail in Procedure 019-166 in the appropriate service manual, and is hereafter referred to as J1708 in this document. Engine data links (both J1939 and J1708) are discussed in more detail in Procedure 019-428 in the appropriate engine service manual.

Electronic Service Tool Description

The recommended Cummins® electronic service tool, or equivalent, is a Windows® based software application that works with Cummins® ECMs to diagnose and troubleshoot engine problems, store and analyze historical information about an engine, and to modify an engine's operating values. The electronic service tool Professional also enables you to transfer calibrations to an ECM.

The electronic service tool is used on a personal computer (PC) that is attached to an ECM through an INLINE™ data link adapter kit.

Note : 1. The INLINE™, INLINE™ I, INLINE™ 2, INLINE™ 4, and INLINE™ 5 adapters have become obsolete. They can be used with the electronic service tool, but technical support for these adapters is not available.

After registering a copy of the electronic service tool and connecting to an ECM data source, the electronic service tool enables you to retrieve present or recorded data about an engine, alter ECM settings, store data for viewing at a later time, analyze data to monitor and assess the operation of an engine, and view active or inactive engine fault codes.

The electronic service tool is installed in the INTELECT™ folder on the hard drive of a personal computer. User manuals are available in the INTELECT™ and Manuals folder for specific Cummins® electronic engines. Additional information for service and support from a Cummins® distributor for the electronic service tool questions is included in the front of the user manuals.

Different versions of the electronic service tool may be available for use at one time, although some electronic service tool versions may **not** be compatible with some ECMs. ECM and electronic service tool compatibility information is available at the Product website. Electronic service tool improvements are sometimes released as Feature Packs. The latest Feature Pack information for specific electronic service tool versions is also available at the electronic service tool product website. It is important to maintain the electronic service tool with the latest versions and Feature Packs that become available.

The electronic service tool can utilize either a communication port (COM port), universal serial bus (USB), WIFI, or Bluetooth connection on the PC when communicating with an ECM. A COM port **must** be configured properly for the electronic service tool to function correctly. It is possible for other software programs on the PC to take control of a COM port and prevent the electronic service tool from accessing the COM port. Troubleshooting information for the electronic service tool communication issues is available in the base user manual and also in the ECM No Communication Troubleshooting Tree on QuickServe™ Online or Intercept.

Initial Check

Electronic service tool

- In the main electronic service tool window, verify that the data link selected in the ECM Data Source Connection drop-down matches the data link hardware being used
- Verify the correct version is installed. The version can be determined from the main window by selecting Help, About.
- Verify the infrared port is disabled so the serial port is **only** being used for ECM communications.
- If you have the Palm Pilot Hot Sync Manager on a PC that **only** has one serial port, you **must** disable the Hot Sync Manager before connecting to an ECM.

Data Link Adapters

- Check the firmware version of the INLINE™ data link adapter to make sure it is the latest firmware version available
- Verify that the data link adapter being used is compatible with the data link wiring available on the engine or vehicle.

- A data link adapter is a device that converts the J1708, or J1939 data link messages from the ECM into a message that a PC can process. Because the electronic service tool is a

PC based tool, a data link adapter is required to troubleshoot engines.

- Cummins® Service Products offer the following data link adapter kits:
  - INLINE™ 4 adapter kit, Part Number 4918190
  - INLINE™ 5 adapter kit, Part Number 4918416
  - INLINE™ 6 adapter kit, Part Number 2892092
  - INLINE™ 7 adapter kit, Part Number 5299899.

- The following illustration shows INLINE™ data link adapters.

Power for the INLINE™ data link adapters depends upon the communication setup in use. The 12 VDC power is supplied by the vehicle power system for the vehicle and engine communication setups. The 12 VDC power is supplied by an auxiliary power supply for the bench communication setup.

The INLINE™ data link adapter will support either J1708 or J1939 protocol. When connecting with the electronic service tool using an INLINE™ data link adapter, the electronic service tool will attempt to establish communication with an ECM on J1939 first. If no communication is established on J1939, the electronic service tool will then attempt to establish communication on J1708.

1. Power light
2. J1939 communication light
3. J1708 communication light
4. RS-232 to PC light.

The INLINE™ 4 is an RP1210A compliant data link adapter that will support both J1708, and J1939 protocol. RP1210A is an industry wide standard that defines data link message format for service tools. The INLINE™ 4 **must** be configured correctly within the electronic service tool to define the COM port being used on the PC and the type of data link protocol that is available, J1708, J1939, or autodetect.

Data Link Adapter Identification Diagram - INLINE™ 5.

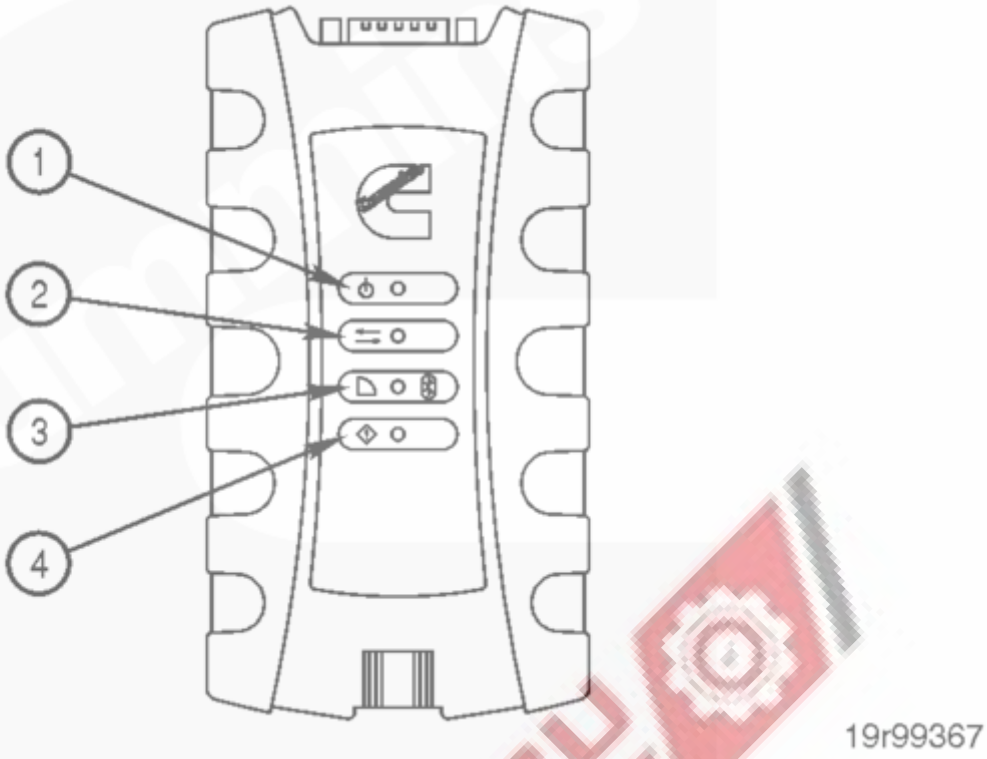
1. Power light
2. J1939 communication light
3. J1708 communication light
4. RS-232 to PC light
5. USB to PC light.

The INLINE™ 5 is an RP1210A compliant data link adapter that will support both J1708, and J1939 protocol. It can be used with either a COM port or USB port. The INLINE™ 5 **must** be configured correctly within the electronic service tool to define the COM or USB port being used on the PC and the type of data link protocol that is available, J1708, or J193, or autodetect.

Data Link Adapter Identification Diagram - INLINE™ 6

1. Power light
2. CAN 1 communication light (J1939)
3. CAN 2 communication light (J1939)
4. J1708 communication
5. RS-232 to PC light
6. USB to PC light.

The INLINE™ 6 is an RP1210A compliant data link adapter that will support both J1708 and J1939 protocols. It can be used with either a COM port or USB port. The INLINE™ 6 **must** be configured correctly within the electronic service tool to define the COM or USB port being used on the PC and the type of data link protocol that is available, J1708, J1939, or autodetect.



Data Link Adapter Identification Diagram - INLINE™ 7

1. Power light
2. Communication light
3. Communication-type light/indicator
4. Fault light.

The INLINE™ 7 is an RP1210A, RP1210B, and RP1210C compliant data link adapter that will support J1587/J1708 as well as J1939 (250K, 500K, or 1MB Baud Rate). It can **only** be connected to the PC via USB, WIFI, or Bluetooth connection. The tool **must** be configured correctly within the electronic service tool to define the connection type on the PC and the type of data link protocol that is available, either J1587/J1708 or J1939.

The INLINE™ data link adapters require firmware software in order to operate correctly. Firmware versions are updated periodically and **must** be uploaded into data link adapters when updates are released. The latest firmware version is always available on the most recent INCAL™ DVD-ROM as well as from the website http://cumminsengines.com/inline. The firmware version for a data link adapter can be found within the recommended Cummins electronic service tool or equivalent. When using the electronic service tool, the firmware version is displayed at the lower right corner of the main window when connected to an ECM. The electronic service tool **must** be connected to an ECM in order for the firmware version to be displayed.

Setup

General Information

Communication with the ECM can be established at three basic locations:

- Bench communication setup
- Vehicle communication setup
- Engine communication setup.

The communication setups are described in more detail in the remainder of this procedure. Each location utilizes different data link adapter cables. All three locations require either a serial cable, USB cable, WIFI, or Bluetooth connection to interface from the data link adapter to the PC. Reference the table below.

The ECM on newer engines can support data link communication on the OEM data link through the OEM connector at the ECM. It can also support data link communication on the engine data link through the engine connector at the ECM. The wiring diagram for a specific engine and ECM **must** be consulted to determine if an ECM supports both OEM data link and engine data link communication.

For Midrange and Heavy Duty engines, the recommended communication setup, if available, is the Cummins Inc. bench communication setup which establishes communication directly to the ECM. The bench communication setup can support both J1708 and J1939 data link protocols, when used with ECMs that support both protocols.

For High Horsepower engines with multiple ECMs, the recommended communication setup is the engine communication setup through the 9 pin connector provided in the engine harness.

J1939 data link communication, if available, is preferred for transferring calibrations because of less interference from other data link devices such as traction control systems and electronic dashes. J1708 communication can require extra time to disable the OEM ECMs that are also communicating on the J1708 data link in order to avoid interference from those devices. Also, the J1939 information transfer rate is faster than J1708 and a calibration download will take less time to complete using J1939 communication compared to J1708 communication.

The functionality of a communication setup can be verified by testing the communication setup on a second ECM or vehicle, if available, or by completing the resistance checks defined for each setup type.

The following table summarizes the ECM communication setups.

Communication Setup	Data Link Connection Location	Engine ECM data link Source	Data Link Protocols Supported
Bench	ECM connector	OEM	J1708, J1939
Vehicle 6 pin	Dash 6 pin connector	OEM	J1708
Vehicle 9 pin	Dash 9 pin connector	OEM	J1708, J1939[1]

Communication Setup	Data Link Connection Location	Engine ECM data link Source	Data Link Protocols Supported
Engine	Engine harness 3 pin connector	Engine	J1939
Engine	Engine harness 6 pin connector	Engine	J1708[2]
Engine	Engine harness 9 pin connector	Engine	J1939[3]

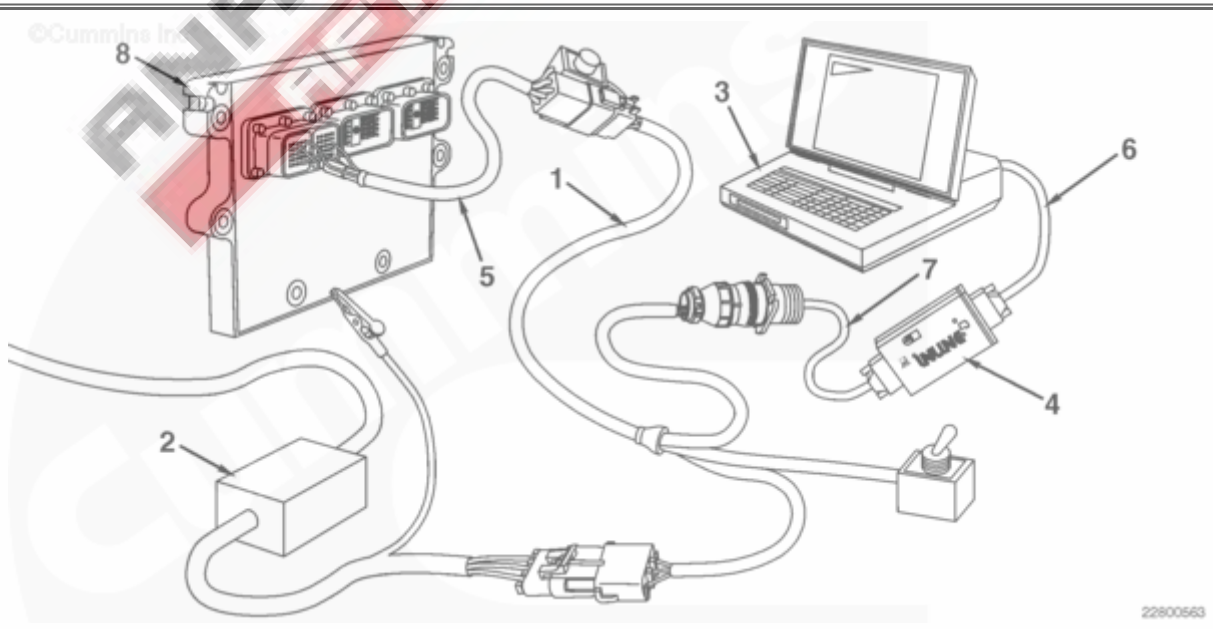
Notes:

1. The 9 pin connector **must** be fully wired to support J1939 protocol.
2. Available **only** on selected older engines.
3. Available **only** on selected High Horsepower engines.

Bench Communication Setup

The bench communication setup establishes communication directly with the ECM through the connector port on the ECM. An example of a bench communication setup is shown below.

The bench calibration harness (1) is common for most bench setups and can be used with the appropriate bench calibration cable (5) to communicate with various ECMs. A list of available bench calibration cables (5) for various ECMs is included in Service Tool Instruction, Bulletin 3377791, which is accessible on QuickServe™ Online. Proper function of the bench calibration harness (1) and bench calibration cable (5) can be verified by using the wiring diagrams provided to complete resistance checks.



Bench Communication Setup

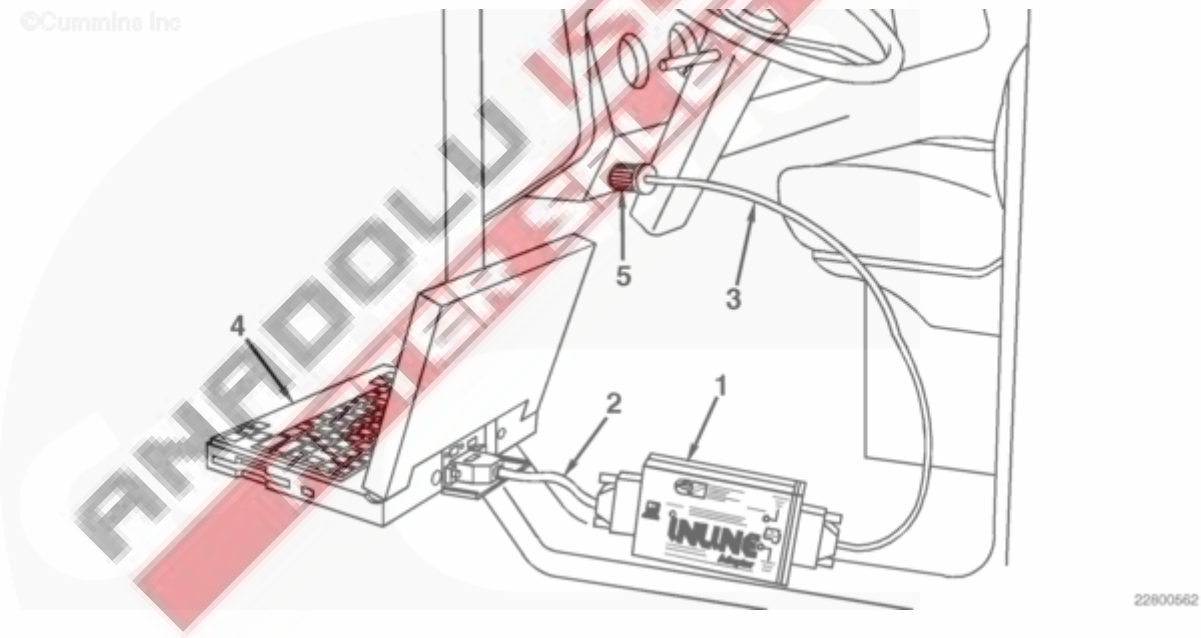
1. Bench calibration harness, Part Number 3163151

2. Power supply$_1$
3. Electronic service tool
4. Data link adapter
5. ECM$_1$ bench calibration cable
6. USB cable, Part Number 4918591, or serial cable, Part Number 4918418 (reference table above for cable type)
7. Data link adapter cable, Part Number 3165159 (INLINE™ 4, 5, and 6
8. CM570 ECM (example).

Note : 1. See Service Tool Instruction, ECM Bench Calibration Base Harness, Bulletin 3377791, for part number.

Vehicle Communication Setup

An additional communication setup is a 9 pin or 6 pin Deutsch™ connection that is commonly located in the cab of a vehicle. The vehicle communication setup utilizes the OEM harness and connects to the ECM at the OEM connector port. A 9 pin connector in the cab, if fully wired, is capable of supporting both J1939 and J1708 protocol. Some OEMs place a 9 pin connector in the cab but do **not** provide wiring to support J1939 protocol. A 6 pin connector will **only** support J1708 protocol.



On Vehicle Communication Setup

1. Data link adapter
2. USB cable, Part Number 4918591, or serial cable, Part Number 4918418 (reference table above for cable type)
3. Data link adapter cable$_1$
4. Electronic service tool
5. Vehicle data link adapter connector$_1$.

Note : 1. See Service Tool Instruction, ECM Bench Calibration Base Harness, Bulletin 3377791, for part number.

Note : INLINE™ 6 data link networks equipped to support 500K baud data link speeds require an adapter tool, Part Number 5299126, to connect to the 9 pin connector.

Note : Only the INLINE™ 6 and INLINE™ 7 are capable of supporting data link speeds of 500K baud. The INLINE™ 4 and INLINE™ 5 do **not** support 500K baud data link speeds.

Engine Communication Setup

The engine communication setup utilizes the engine data link provided on the engine wiring harness. Depending upon the engine, the engine communication setup available on the engine harness can be a 3 pin Deutsch™ connector, a 6 pin Deutsch™ connector, or a 9 pin Deutsch™ connector.

A 3 pin Deutsch™ connector on the engine harness is available on newer engines and provides a connection point to the J1939 data link. A mini-backbone cable, which includes a 60 ohm resistor and a gender changer cable, may be required in order to connect to the ECM on the J1939 protocol. An auxiliary power supply is required for the data link adapter.

2. Power supply cable$_1$
3. Electronic service tool
4. Data link adapter
5. Gender changer cable, Part Number 3163597
6. Mini-backbone cable, Part Number 3163096

7. USB cable, Part Number 4918591, or serial cable, Part Number 4918418 (reference table above for cable type)
8. Engine harness 3 pin connector, Part Number 3165141.

Note : 1. See Service Tool Instruction, ECM Bench Calibration Base Harness, Bulletin 3377791, for part number.

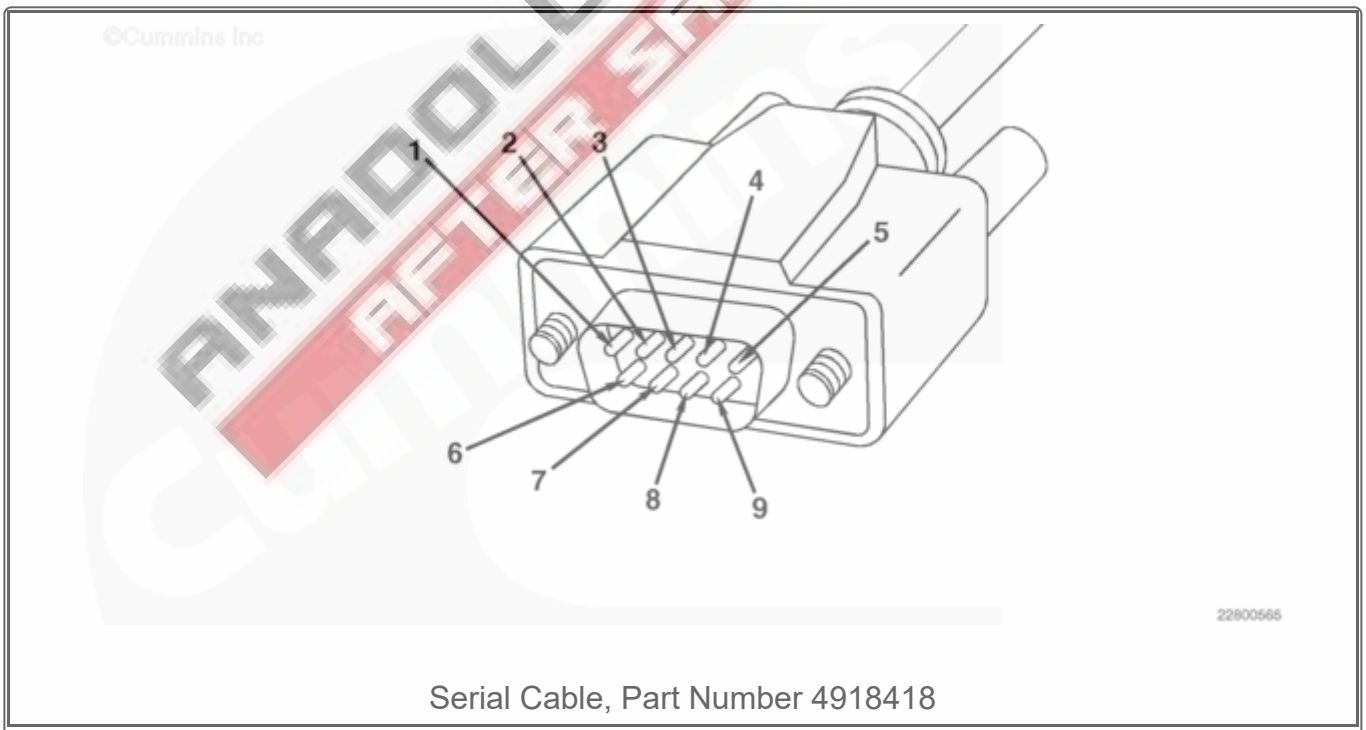
A 6 pin Deutsch™ connector is available on the engine harness for some older engines and provides a connection point to the engine J1939 data link. The 6 pin connector includes a power supply for the data link adapter.

Resistance Check

A serial cable is required to interface from the data link adapter to the PC, or a USB cable can be used with an INLINE™ 5/6/7 data link adapter.

⚠ CAUTION ⚠

Use test lead, Part Number 3822758, and test lead, Part Number 3822917, to avoid the possibility of damage to the serial cable pins.



Serial Cable, Part Number 4918418

1. Open
2. Transmit data
3. Receive data
4. Data terminal ready (+5 VDC)
5. Signal ground
6. Open

7. Request to send (+5 VDC)
8. Clear to send
9. Open.

- Insert a test lead into pin 1 of the female end of the serial cable, and connect it to the multimeter probe. Attach the other test lead to pin 1 of the male end of the serial cable, and connect it to the multimeter probe.
- Measure the resistance. The multimeter **must** show a closed circuit (10 ohms or less). Repeat the resistance measurement for pins 2 through 9. The multimeter **must** show a closed circuit (10 ohms or less) for each pin. If the circuit is **not** closed, replace the serial cable.

⚠ CAUTION ⚠

To avoid the possibility of damage to connector pins, use test lead, Part Number 3823993, on the 8 pin connector. Use test lead, Part Number 3823994, on the round 9 pin connector. Use test lead, Part Number 3824812, on the 3 pin connector.

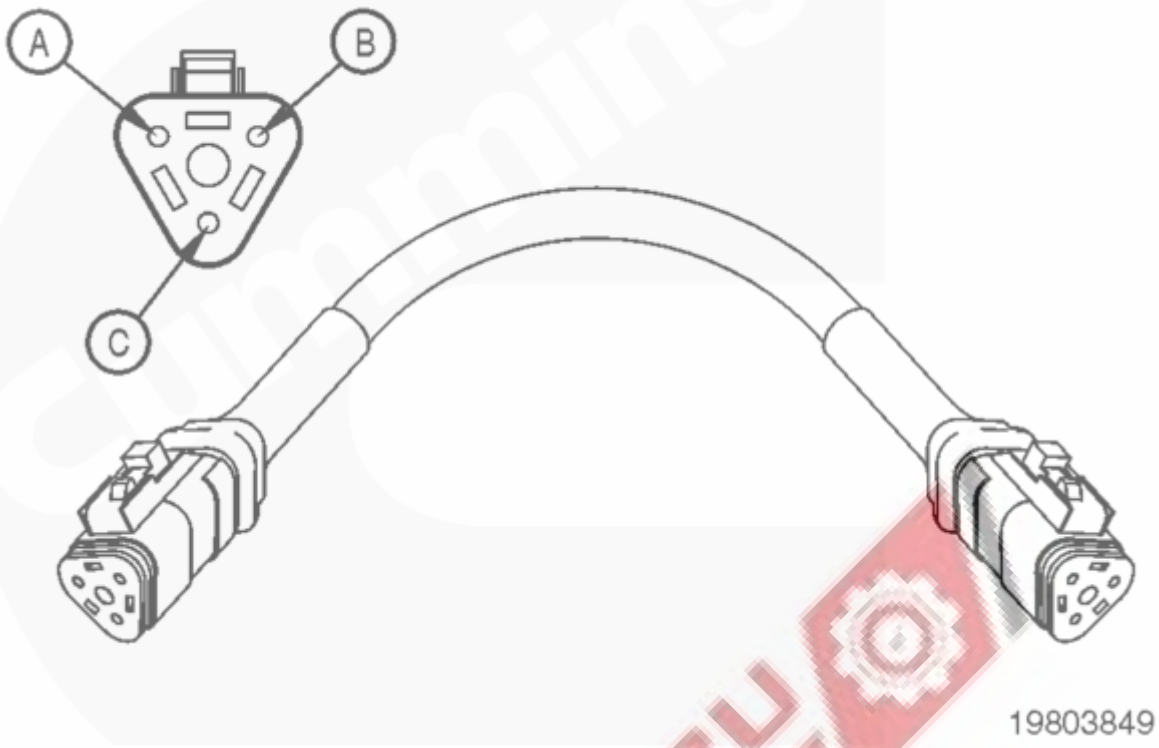
3 Pin Data Link Cable, Part Number 3165141

- Measure the resistance from pins A, B, and C in the 3 pin connector to the corresponding location in the 25 pin connector, as shown. Measure the resistance from pins D and E in the 2 pin power supply connector to the corresponding location in the 5 pin connector, as shown. The multimeter **must** show a closed circuit (10 ohms or less). If a circuit is **not** closed, replace the data link cable.

⚠ CAUTION ⚠

To avoid the possibility of damage to connector pins, use two male test leads, Part Number 3823993, on each 3 pin connector.



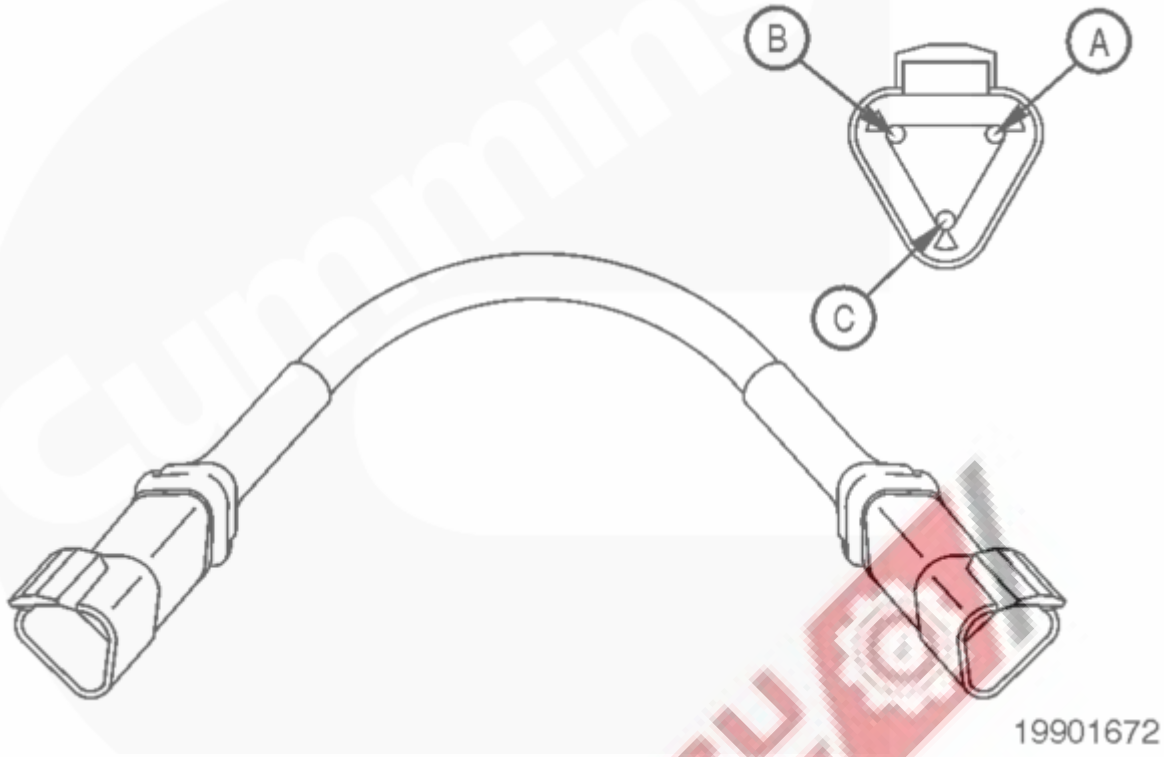
Mini Backbone Cable, Part Number 3163096

- Measure the resistance from pin A in one end of the backbone cable to pin A in the opposite end of the backbone cable. Repeat for pins B and C. The multimeter **must** show a closed circuit (10 ohms or less). If a circuit is **not** closed, replace the backbone cable. Measure the resistance across pins A and B at either end of the cable to measure the terminating resistance. The terminating resistance value **must** measure between 50 to 70 ohms.

⚠ CAUTION ⚠

To avoid the possibility of damage to connector pins, use two female test leads, Part Number 3823994, on each 3 pin connector.

©Cummins Inc

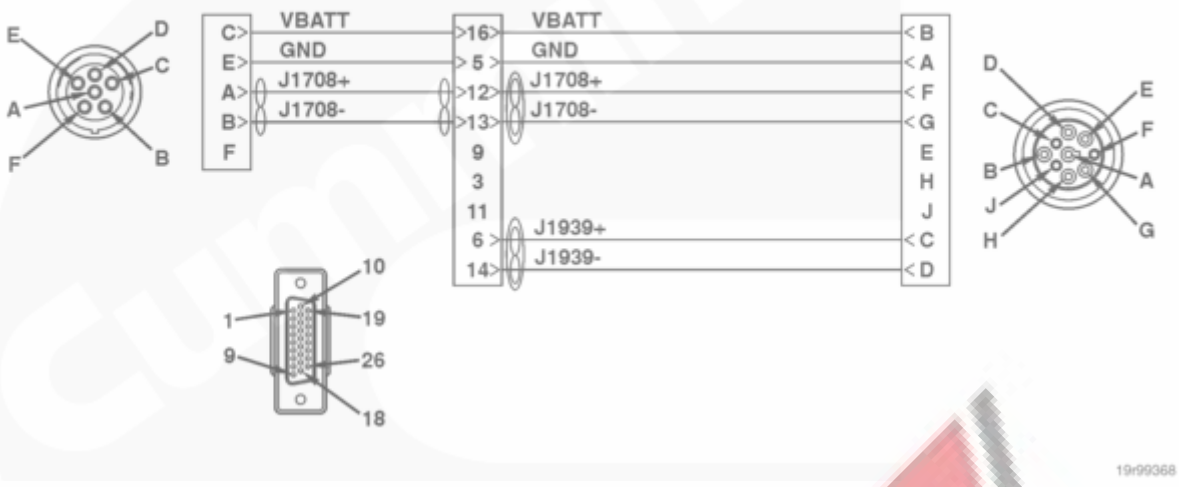


Gender Changer Cable, Part Number 3163597

- Measure the resistance from pin A in one end of the gender changer cable to pin A in the opposite end of the gender changer cable. Repeat for pins B and C. The multimeter **must** show a closed circuit (10 ohms or less). If a circuit is **not** closed, replace the gender changer cable.

⚠ CAUTION ⚠

To avoid the possibility of damage to connector pins, use two male test leads, Part Number 3164113, on the 26 pin connector to the INLINE™ 7. Use male test lead, Part Number 3824811, on the 6 pin Deutsch™ connector. Use male test lead, Part Number 3823993, on the 9 pin Deutsch™ connector.



INLINE™ 7 Data Link Cable

6 Pin Deutsch™ Connector Troubleshooting

- Measure the resistance from pins A, B, C, and E in the 6 pin connector to the corresponding location in the 26 pin connector, as shown. The multimeter **must** show a closed circuit (10 ohms or less). If a circuit is **not** closed, replace the data link cable.

9 Pin Deutsch™ Connector Troubleshooting

- Measure the resistance from pins A, B, C, D, E, F, and G in the 9 pin connector to the corresponding location in the 26 pin connector, as shown. The multimeter **must** show a closed circuit (10 ohms or less). If a circuit is **not** closed, replace the data link cable.

General Information

This section provides guidance on how to properly disassemble the engine. Cummins Inc. recommends that the product be disassembled according to the disassembly procedure in this section.

If your product is equipped with a component or accessory **not** manufactured or supplied by Cummins Inc., see the removal instructions provided by the component manufacturer.

Always follow general safety instructions when servicing products. See General Safety Instructions procedure in Section I.

Always follow general cleaning instructions when servicing products. See General Cleaning Instructions procedure in Section I.

Prior to beginning engine disassembly, the following should be completed.

- Customer supplied components or accessories should be removed
- Engine removed from chassis and installed on a stand (if applicable). See Engine Removal Procedure in Section 0.

Procedures required to disassemble the engine are listed in order from removing the first item to removing the last item and completing engine disassembly. The procedures can be found using the reference information listed.

Multiple steps are included in procedures for basic repair and troubleshooting information, but **not** all of them should be completed when disassembling an engine. The Engine Disassembly procedure indicates which step(s) should be completed for the designated procedure.

Steps titled “Clean,” “Inspect for Reuse,” or “Clean and Inspect for Reuse” are all covered in one column titled “Clean and Inspect for Reuse.” Perform the steps as applicable in the procedure. If the “Clean and Inspect for Reuse” column is marked, complete the Clean and Inspect for Reuse steps, no matter how they are divided in the procedure.

ANADOLU ISUZU AFTER SALES

General Information

This section provides guidance on how to properly assemble the engine. Cummins Inc. recommends that the product be assembled according to the assembly procedure in this section.

If your product is equipped with a component or accessory **not** manufactured or supplied by Cummins Inc., see the installation instructions provided by the component manufacturer.

Always follow general safety instructions when servicing products. See General Safety Instructions procedure in Section I.

Always follow general cleaning instructions when servicing products. See General Cleaning Instructions procedure in Section I.

Procedures required to assemble the engine are listed in order from installing the first item to installing the last item and completing engine assembly. The procedures can be found using the reference information listed.

Multiple steps are included in procedures for basic repair and troubleshooting information, but **not** all of them should be completed when assembling an engine. The Engine Assembly procedure indicates which step(s) should be completed for the designated procedure.

After assembling the engine, the following may need to be performed.

- Validate the engine assembly.
- Install the engine in-chassis. See Engine Installation procedure in Section 0.
- Install customer supplied components or accessories as needed. See equipment manufacturer service information.

For engine storage less than 6 months, complete the following:

- Prevent dirt and moisture from entering the engine.
- Cover all open ports of the engine. Utilize heavy paper, plastic, and tape.
- Cover the engine with plastic.

For engine storage greater than 6 months, follow the specified long term storage instructions. See Engine Storage - Long Term procedure in section 0.

Remove

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

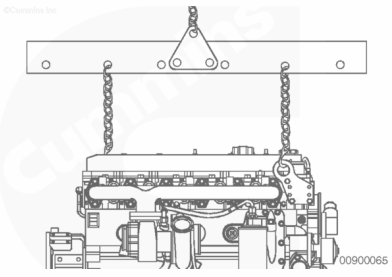
Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

- Place a tag on all hoses, lines, linkages, and electrical connections as they are removed to identify their locations.
- Disconnect the batteries. See equipment manufacturer service information.
- Drain the engine coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Disconnect the starter cable, engine ground straps, cab or chassis to engine hoses, tubing, electrical wires, wire harnesses, and hydraulic lines.
- Disconnect the drive units from the flywheel. See equipment manufacturer service information.
- Remove all chassis components necessary to remove the engine from the equipment.
- Cover all engine openings to prevent dirt and debris from entering the engine.

Note : On applications where the rear engine mounts are attached to the transmission, it will often be necessary to remove the engine and transmission as an assembly. See equipment manufacturer service information.

⚠ WARNING ⚠

The engine lifting equipment must be designed to lift the engine and transmission as an assembly without causing personal injury.



Use a properly rated hoist and engine lifting fixture, attached to the engine-mounted lifting brackets, to remove the engine. Refer to Procedure 018-015 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-015.html)

Note : If the transmission is **not** removed with the engine, place a support under the transmission to prevent it from falling before removing the engine.

Place the engine on suitable engine support stands.

Remove all remaining accessories and brackets to use with the replacement engine.

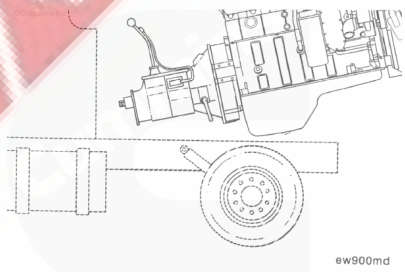
Install

⚠ WARNING ⚠

The engine lifting equipment must be designed to lift the engine and transmission as an assembly without causing personal injury.



Install all accessories and brackets removed.

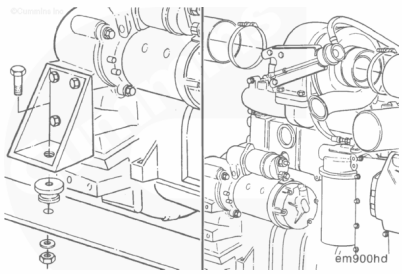
Note : On applications where the rear engine mounts are attached to the transmission, it will often be necessary to install the engine and transmission as an assembly.

Use a properly rated hoist and engine lifting fixture, attached to the engine-mounted lifting brackets, to install the engine.

Use the following procedure for engine weights. Refer to Procedure 018-015 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-015.html)

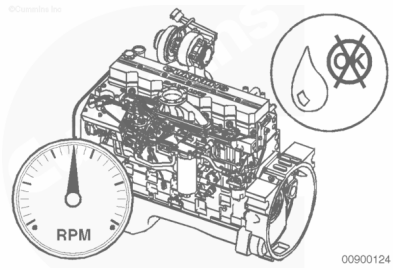
Align the engine in the chassis. Tighten the engine-mounting capscrews. See equipment manufacturer service information for torque specifications.

Connect all engine- and chassis-mounted accessories removed.



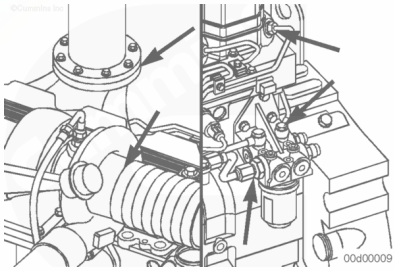
Note : Make sure all lines, hoses and tubes are properly routed and fastened to prevent damage.

Make sure the air intake and exhaust pipe connections are tight and free of leaks.



- Uncover all engine openings.
- Connect the drive units to the flywheel. See equipment manufacturer service information.
- Connect the starter cable, engine ground straps, cab or chassis to engine hoses, tubing, electrical wires, wire harnesses, and hydraulic lines.
- Fill the lubricating oil system. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Fill the engine cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Remove all tags on all hoses, lines, linkages, and electrical connections.

Perform a final inspection to make sure all hoses, wires, linkages, and components have been properly installed and tightened.

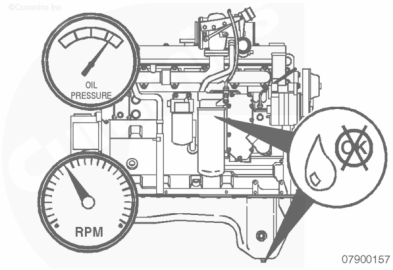


Crank the engine until the oil pressure gauge indicates a positive pressure.

Operate the engine at low idle for two to three minutes.

Shut off the engine. Wait five to seven minutes for the oil to drain to the oil pan. Check the oil and coolant levels again.

Fill the engine to the correct oil and coolant levels, if necessary.



Operate the engine at 1000 to 1200 rpm for eight to 10 minutes. Check for proper operation, unusual noises, coolant, or oil leaks.

Repair all leaks and component problems. Refer to Procedure 014-008 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-008.html)

General Information

Introduction

This procedure describes the proper method for placing an engine into long-term storage (more than 1 year), and returning a stored engine to service. The storage procedure applies to engines in running condition and applies whether the engine will remain in the equipment or will be removed for storage.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [122°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

⚠ CAUTION ⚠

Never use diesel fuel containing bio components for internal preservation of fuel system for engine storage. Fuel degradation may cause damage and lead to malfunction of fuel system components.

Preparing Spare or Rebuilt Engine for Long Term Storage

The steps below **only** apply to engines that are received directly from a Cummins Inc. assembly plant or a Master Rebuild Center.

- Apply a lightweight lubricant or rust preventative to machined surfaces that are **not** painted.

- Apply a lightweight lubricant or rust preventative to any internal cast surfaces, such as coolant inlet and outlet connections, that are visible and **not** painted.
- Cover engine and component openings with clean care caps or heavy paper and tape to prevent dirt and moisture from entering engine.
- Remove all external drive belts.
- Install appropriate desiccant on engine to absorb any moisture.
- Cover entire engine with plastic.
- Move engine or equipment to an appropriate storage area.
    - Storage area **must** be dry with uniform temperature. Recommended storage temperature is between -12˚C [10˚F] and 49˚C [120˚F], with relative humidity less than 60 percent.

Preparing an In-Use Engine for Long Term Storage

To prepare an engine for long term storage, complete the following steps. Reference corresponding service procedures as necessary.

- Change engine lubricating oil.
- Replace engine lubricating oil filters.
- Replace fuel filters.
- Verify fuel supply contains less than 5% bio components.
- Start engine. Operate engine under normal operating conditions for 25 minutes.
    - For further information on engine operating instructions, see corresponding Operation and Maintenance Manual. Reference Section 1.
- Turn engine off.
- If engine has been removed from equipment:
    - Drain engine lubricating oil.
    - Drain coolant.
    - Apply a lightweight lubricant or rust preventative to machined surfaces that are **not** painted.
    - Apply a lightweight lubricant or rust preventative to any internal cast surfaces, such as coolant inlet and outlet connections, that are visible and **not** painted.
- If engine has **not** been removed from equipment:
    - Verify cooling system is filled with an approved, fully formulated coolant.
    - Measure supplemental coolant additive (SCA) concentration and adjust, if necessary.
    - Check coolant quality annually during storage.
- If engine is equipped with a marine heat exchanger:
    - Drain raw water system
    - Flush raw water system
    - Drain water
- Cover all of engine and component openings with clean care caps or heavy paper and tape to prevent dirt and moisture from entering engine.
- Remove all external drive belts.
- Cover entire engine with plastic.
- Move engine or equipment to an appropriate storage area.
    - Storage area **must** be dry with uniform temperature. Recommended storage temperature is between -12˚C [10˚F] and 49˚C [120˚F], with relative humidity less than 60 percent.

ANADOLU ISUZU PARTS SALES

Preparing Aftertreatment Components for Long Term Storage

- For Engine with a displacement of 19 L and above refer to Service Bulletin, Storage of Individual UL2 Aftertreatment Diesel Exhaust Fluid (DEF) System Components, Bulletin 5504262 (/qs3/pubsys2/xml/en/bulletin/5504262.html) for instructions on preparing aftertreament components for long term storage. Refer to procedure 011-143 in Section 11 for instructions on Purging the Diesel Exhaust Fluid in preparation for storage.

Refer to procedure 011-143 Aftertreatment Diesel Exhaust Fluid Dosing Unit Manual Purge, for instructions on Purging the Diesel Exhaust Fluid in preparation for storage

Removing Engine from Long Term Storage

To remove the engine from long term storage, complete the following steps below. Also reference corresponding Service Manual procedures.

- Install new fuel and coolant filters, if equipped.
- Fill engine to high mark with engine lubricating oil.
- Cooling system procedures:
    - If engine cooling system was drained:
        - Fill cooling system with coolant. See Coolant Recommendations and Specifications procedure in Section V of corresponding Owners or Operation and Maintenance manual for cooling system specifications.
    - If engine was stored with fully formulated coolant:
        - Check coolant quality. Replace coolant if necessary.
        - Measure SCA concentration and adjust, if necessary.
        - Verify cooling system is properly filled. See Coolant Recommendations and Specifications procedure in Section V of corresponding Owners or Operation and Maintenance manual for cooling system specifications.
- Prime lubricating oil system.
    - With Prelubricating Oil Pump:
        - Complete a pre-lubricating oil system cycle.
        - Rotate crankshaft 240 degrees.
        - Complete a pre-lubricating oil system cycle.
        - Rotate crankshaft 300 degrees.
        - Complete a pre-lubricating oil system cycle.
        - Rotate crankshaft 240 degrees.
        - Complete a pre-lubricating oil system cycle.
    - Without Pre-lubricating Oil Pump:
        - Install oil pressure gauge or pressure transducer in the engine lubricating oil system as far downstream of the lubricating oil pump as possible.
        - Crank engine without firing for 30 seconds while observing oil pressure.
        - Pause for 3 minutes.
        - Repeat steps 2 and 3 above until nominal oil pressure is observed.
- Install all external drive belts.
- Replace all spark plugs, if applicable.
- If engine is equipped with a marine heat exchanger:
    - Open raw water supply valves
    - Prime raw water pump
- Verify all fuel supply hoses have been tightened.

- Verify all fuel supply and return shutoff valves are open.
- Install all aftertreatment components, if applicable.
- Start engine. See Normal Starting Procedure in Section 1 of corresponding Owners or Operation and Maintenance Manual.
- For electronically controlled engines, troubleshoot any active fault codes.

Removing Aftertreatment Components for Long Term Storage

For Engine with a displacement of 19 L and above refer to Service Bulletin, Storage of Individual UL2 Aftertreatment Diesel Exhaust Fluid (DEF) System Components, Bulletin 5504262 (/qs3/pubsys2/xml/en/bulletin/5504262.html) for instructions on preparing aftertreament components for removing from long term storage.

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

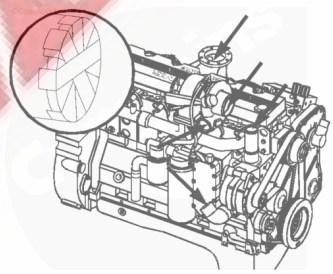
- No additional service items required.

Preparatory Steps

Remove all belts from the engine.

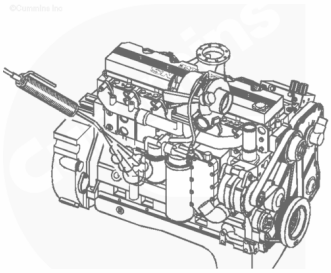
Cover the following parts of the engine:

- Exhaust and intake openings
- Electrical components
- Fuel inlet and drain connections.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Note : Make sure all engine surfaces are clean and dry before painting the engine.

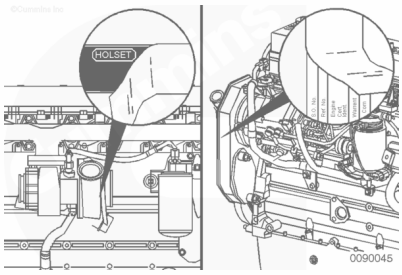
Clean the engine. Use steam.

Dry with compressed air.

Avoid prolonged direct steam or water spray on electrical components.

ANADOLU ISUZU SPARE PARTS

Protect the following components from the paint:



- All dataplates (engine, engine control module (ECM), fuel pump, turbocharger, air compressor, etc.)
- Exhaust manifold
- Turbocharger turbine housing
- Flywheel
- Flywheel housing transmission mounting surface
- Electrical connections
- All decals
- All pulley belt surfaces
- Any exposed fittings, threads, and electrical wire terminals.

Paint the engine.

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

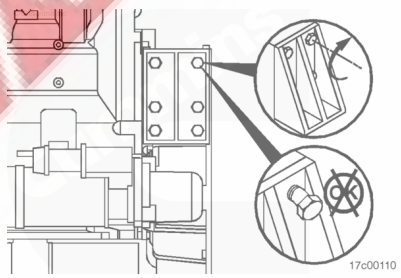
Additional Service Items

- No additional service items required.

Inspect

⚠ CAUTION ⚠

Damaged engine mounts and brackets can cause engine misalignment. Driveline component damage can result in vibration complaints.



Inspect all rubber-cushioned mounts for cracks or damage.

Inspect all mounting brackets for cracks or damaged bolt holes.

Check the torque on the engine-mounting nuts and bolts. Tighten any that are loose. See equipment manufacturer service information for torque specifications.

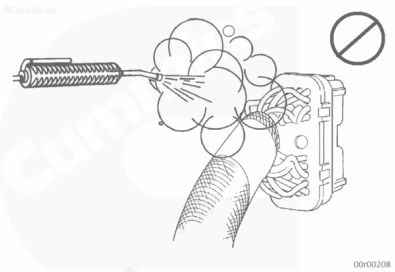
ANADOLU ISUZU

Last Modified: 25-Jul-2016

Clean

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ CAUTION ⚠

Steam ingress into electrical components can cause damage.

Steam is the recommended method of cleaning a dirty engine or a piece of equipment.

Protect all electrical components, openings, and wiring from the full force of the cleaner spray nozzle.

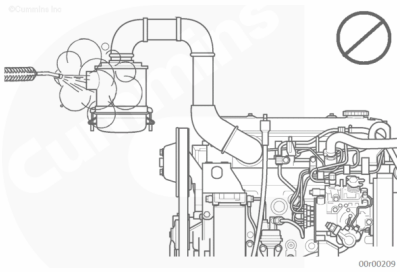
Components to protect include, but are **not** limited to the following:

- Electrical components and connectors
- Wiring harnesses
- Electronic control module (ECM) and connectors, if equipped.
- Belts and hoses
- Bearings (ball or taper roller)

For additional cleaning information. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)

⚠ CAUTION ⚠

Soap, solvent, or water ingress into air intake system can cause engine damage.



Do **not** directly spray or allow soap, solvent, or water to enter any passages, ports, or cowlings that lead to the engine air intake system.

Last Modified: 06-Mar-2017

Select Service Tools

Recommended Cummins® Service Tools

- Barring tool, Part Number 3824591, or equivalent

Additional Service Items

- No additional service items required.

General Information

⚠ WARNING ⚠

Do not pull or pry on the fan to manually rotate the engine. To do so can damage the fan blades. Damaged fan blades can cause premature fan failures which can result in serious personal injury or property damage.

This procedure instructs how to rotate the engine for service events.

Note : The illustrations in this procedure are generic and may **not** represent the hardware on all engines.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

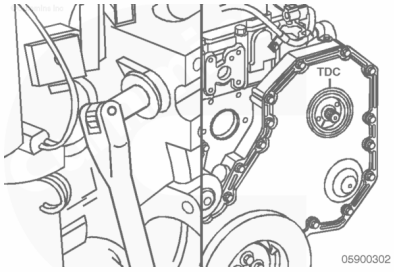
- Disconnect the batteries. See equipment manufacturer service information.

Rotate

Remove the access cover from the flywheel housing.

Use barring tool, Part Number 3824591, or equivalent, to rotate the engine by hand.

Rotate the engine **clockwise** when viewed from the front of the engine.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Remove all tools.
- Connect the batteries. See equipment manufacturer service information.

©Cummins Inc
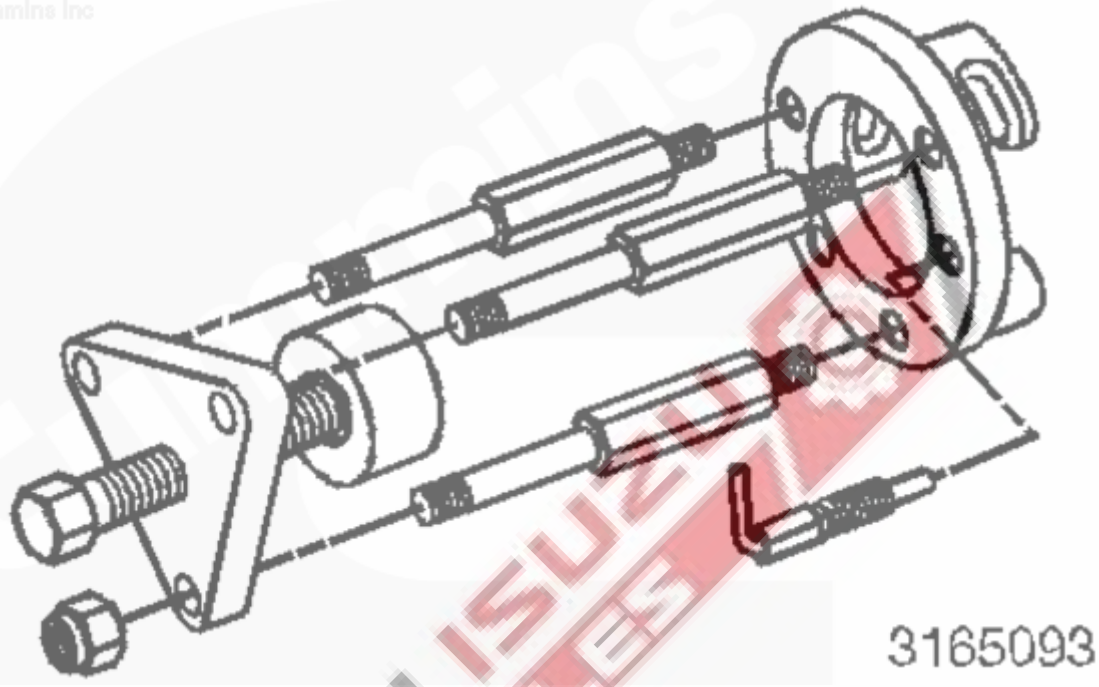
ANADOLU ISUZU
AFTER SALES

Tool Number

3165093

Camshaft Gear Installation and Removal Tool

Used to remove and install the camshaft gear without removing the camshaft. Can only be used on engines with a tapped hole in the camshaft. Use with camshaft gear installation and removal tool, Part Number 3163054.

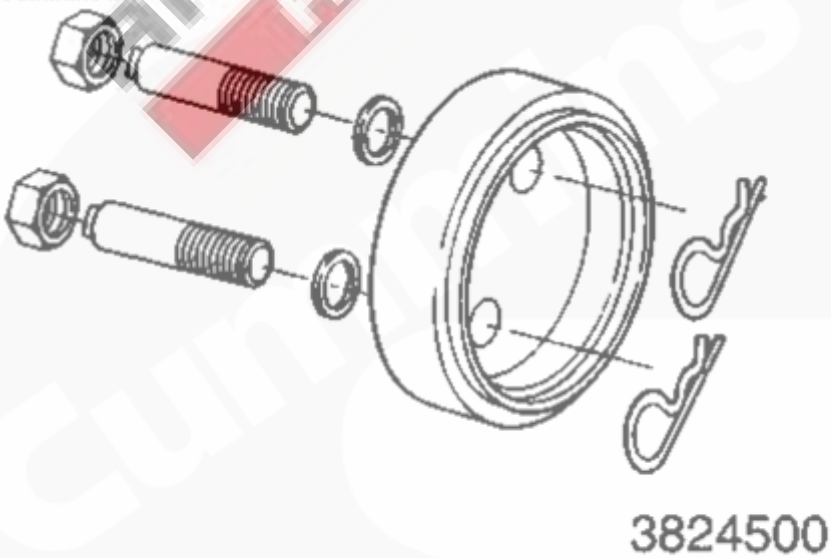


Tool Number

3165112

Wear Sleeve Installation Tool

Used to install the crankshaft front oil wear sleeves.



Tool Number

3375068

Cup Plug Sealant

Used when installing pipe plugs and cup plugs, to prevent leaks.

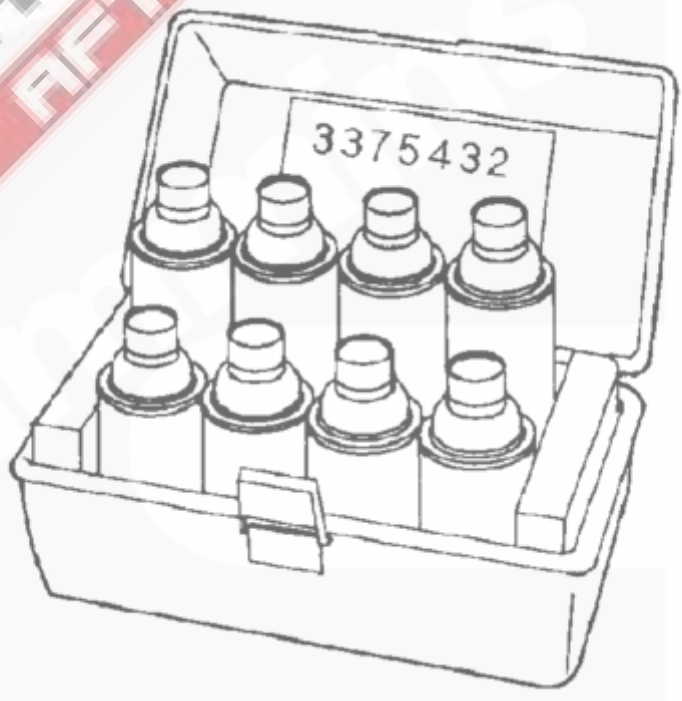
bp8togk

Tool Number

3375432

Crack Detection Kit

Used to locate cracks in cylinder blocks, cylinder heads; as well as in other engine components.



3375432

ANADOLU ISUZU AFTER SALES

Tool Number

3375434

Crack Detection Penetrant

This is a non-magnetic crack detection test kit to detect cracks in engine components.

Tool Number

3376015

Cylinder Liner Puller (Universal)

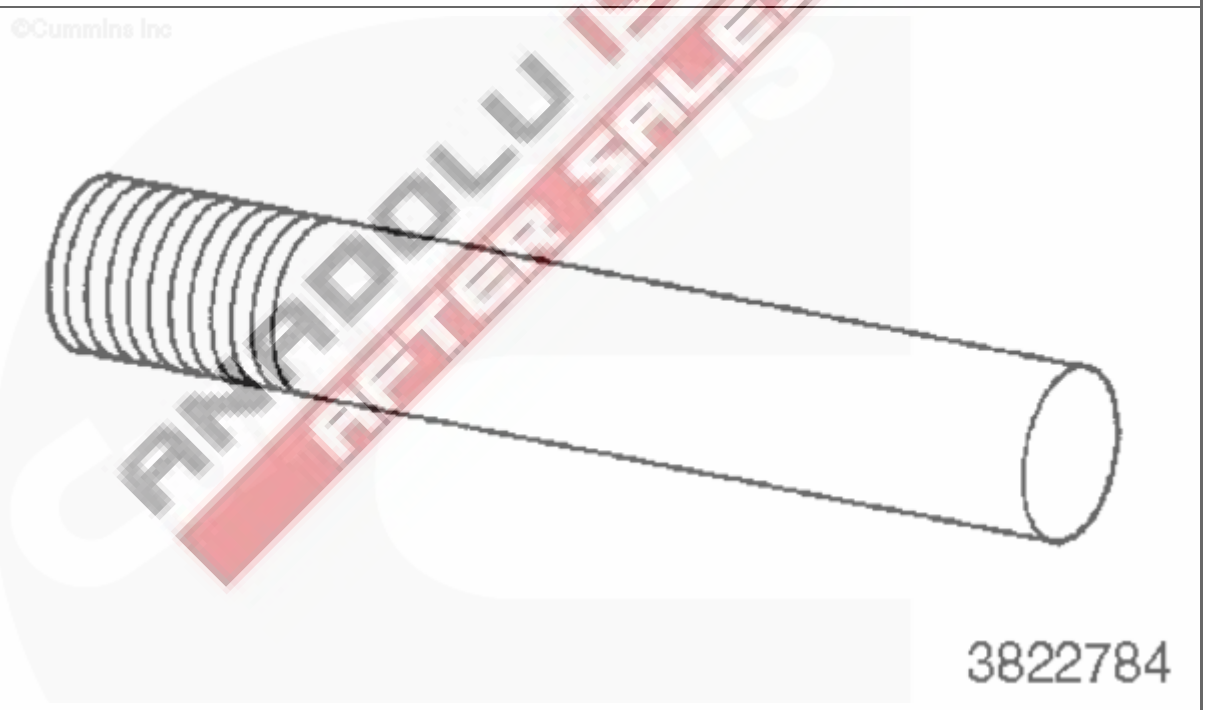
Used to remove cylinder liners from the cylinder block. Requires two puller arm extension feet, Part Number 3376649.

Tool Number

3376488

Assembly Guide Pin

M10 x 1.5



Tool Number

3376619

Dial Bore Gauge Kit

This kit measures diameters of bores from 76 mm [3 in] up to 203 mm [8 in]. The dial face is dimensioned in inches and millimeters.

Tool Number 3376816
Expansion Plug Driver Used to install 25.4 mm [1.00 in] expansion plug to specified depth. Use with expansion plug driver handle, Part Number 3164085.

Tool Number 3376891
Fluorescent Tracer This special dye, when mixed in the cooling system or lubricating system, will help determine the source of the leaks. Used with Leak Test Kit, Part Number 2892320. Black lights must be used to illuminate the fluorescent dye.

Tool Number 3377399
Dial Indicator Magnetic Base Used in conjunction with dial indicator, Part Number 3824564 (metric), or Part Number 4918289 (SAE).

Tool Number 3822503
Cylinder Liner Clamp Set Used to clamp the liner into the bore of the cylinder block. Requires two cylinder head capscrews not included in clamp set.

Tool Number 3822709
Metric Thread Insert Kit (Closed End) Used to repair several sizes of cylinder block threads.

Tool Number

ANADOLU ISUZU
WEB SALES

3823137
Piston Ring Expander Used to install piston rings onto pistons without damaging or distorting the rings.

Tool Number 3823258
Abrasive Hand Pad Used to remove corrosion or carbon buildup.

Tool Number 3823286
Connecting Rod Mandrel Set Locating mandrels are used to locate the connecting rod in connection rod checking fixture, Part Number ST 561. The small mandrels fit in the piston pin bore and the large expanding mandrel fits in the crankpin bore.

Tool Number 3823521
Expansion Plug Driver Used to install 20.638 mm [0.8125 in] expansion plug to specified depth. Use with expansion plug driver handle, Part Number 3164085.

Tool Number 3823522
Expansion Plug Driver Used to install 30.16 mm [1.1875 in] expansion plug to specified depth. Used with expansion plug driver handle, Part Number 3376795.

Tool Number 3823523
Expansion Plug Driver

ANADOLU ISUZU GENUINE SALES

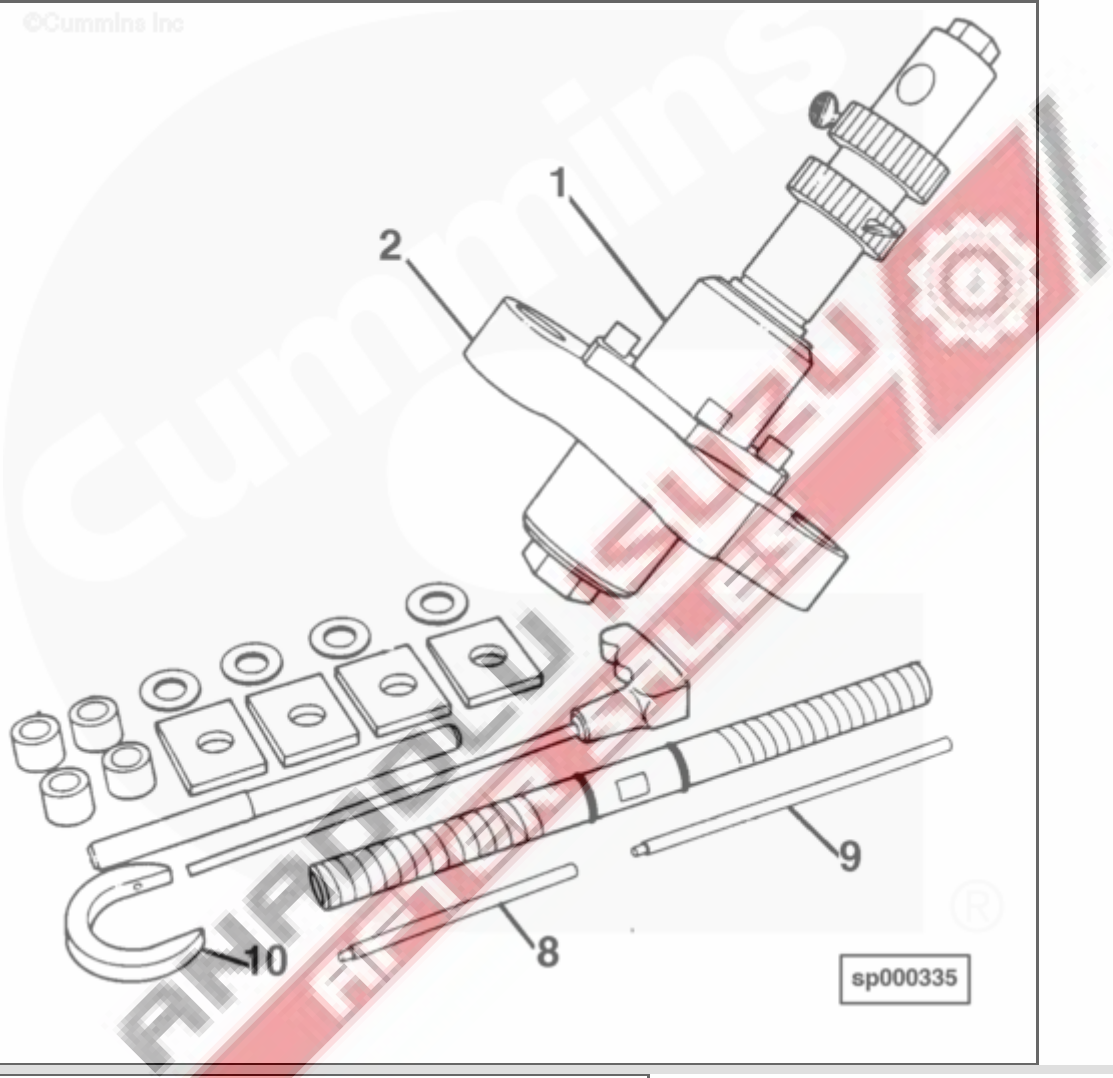
Used to install 34.925 mm [1.375 in] expansion plug to specified depth. Used with expansion plug driver handle, Part Number 3376795.

Tool Number

3823567

Cutter Plate

This counterbore tool is designed to resurface the counterbore ledge area.



Tool Number

3823621

Hydraulic Actuator Kit

Used to remove and install camshaft bushings.

Tool Number

3823818

Main Bearing Rollout Tool

Used to remove and install main bearings with the crankshaft installed.

Tool Number

3824038

Loctite® 271

This is an all purpose medium strength thread locker. This is ideal for all cup plugs or nut and bolt applications ¼ in. or larger. It eliminates the need for stocking expensive locknuts and lockwashers. Threadlocker locks and seals while preventing parts from loosening due to vibration. It also protects threads from corrosion.

Tool Number

3824078

Rear Wear Sleeve Installation Tool

Used to install the rear crankshaft lubricating oil seal wear sleeve.

Tool Number

3824496

Connecting Rod Guide Pins

Used to prevent damage to the crankshaft during piston installation on engines built with connecting rod studs.

Tool Number

3824499

Lubricating Oil Seal Installation Tool

Used to install the front crankshaft lubricating oil seal in the front cover seal carrier.

Tool Number

3824510

Contact Cleaner

This is an alcohol based precision cleaner that is 100 percent free of CFC's. This product is ideal for application where lower flash-point solvents may be used. It evaporates rapidly and completely and is harmless to most plastics. Use this when cleaning electrical/electronics connections. (Flammable).

ANADOLU ISUZU AFTERSALES

Tool Number 3824564
Dial Indicator, Metric Used with indicator base, Part Number 3377399.

Tool Number 4918219
Gauge, Straight Edge This 889 mm [35 in] long precision straight edge can be used for checking components for surface flatness.

Tool Number 5299073
Engine Barring Gear Used to engage the flywheel ring gear to rotate the crankshaft.

Tool Number 5395259
Crankshaft Seal Installation Kit, Rear Used to install laydown lip seal.

Tool Number 5395330
Crankshaft Seal Removal Kit, Rear Used to remove laydown lip seal.

Tool Number 5395409
Carrier Centering Tool, Rear Crankshaft Used to align the rear carrier on front gear train engines only.

ANADOLU ISUZU AFTER SALES

Tool Number ST 561
Connectiong Rod Checking Fixture This special fixture is used to check the connecting rod length, bend and twist. The connecting rod must have the cap assembled for this test. Dial indicators show if the length and bore alignment are acceptable. A feeler gauge is used to check twist. Use appropriate locating mandrels, See ST 562.

Tool Number ST 647
Standard Puller Used to remove drive pulleys, impellers, and air compressor counterweights.

Tool Number ST 1229
Cylinder Liner Driver Used to install cylinder liners into the cylinder block.

Select Service Tools

Recommended Cummins® Service Tools

- Abrasive pad, Part Number 3823258, or equivalent

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

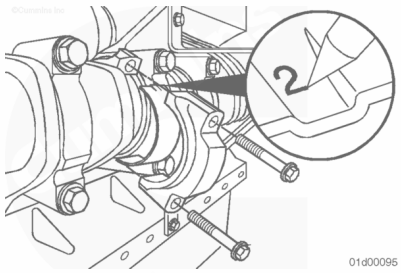
Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Remove the lubricating oil pan and gasket. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)

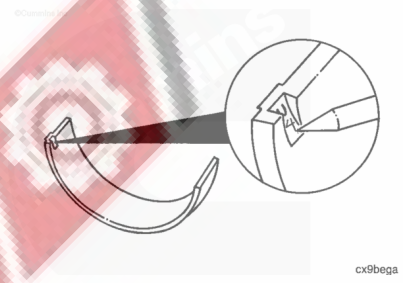
Remove

Note : The cylinder head does **not** need to be removed if the connecting rod bearings are being inspected or replaced.

Remove the connecting rod caps. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)



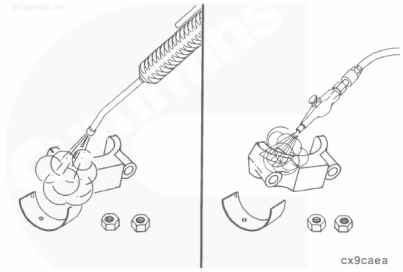
Remove the upper bearing shell. Mark it with the letter "U" (upper) and the cylinder number from where it was removed.



Clean and Inspect for Reuse

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



Wash the bearing and connecting rod caps.

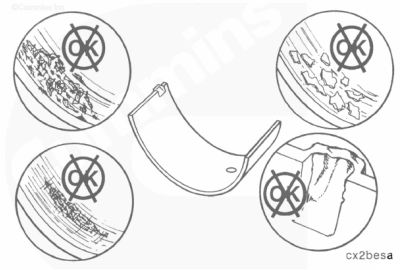
Dry with compressed air.

Inspect the connecting rod caps, connecting rod bearing saddles, and capscrews for nicks, cracks, burrs, scratches, or fretting.

Inspect the bearings for damage.

Replace any bearings with the following damage:

- Pitting
- Flaking
- Corrosion
- Lock tang damage



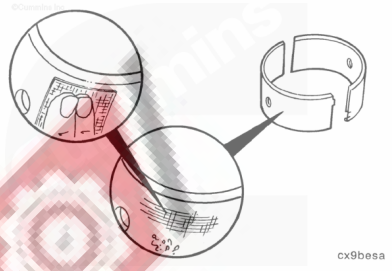
ANADOLU ISUZU
AFTER SALES

- Scratches
- Exposed bronze lining material.

Note : Some engines can be built with a red polymer coating on the upper rod bearing which gives the bearing a red texture finish.

Note : Some engines may be built with a dark grey overlay on the upper rod bearing which could appear green due to oxidation. Oxidation is **not** detrimental to bearing performance.

Inspect the bearing shell seating surface for nicks or burrs.

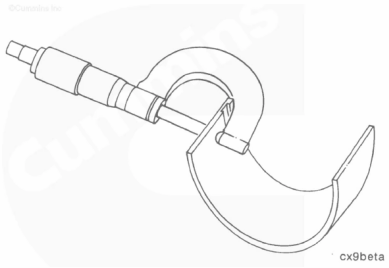


If nicks or burrs can **not** be removed with abrasive pad, Part Number 3823258, or equivalent, the bearings **must** be replaced.

Note : If bearings are damaged, they **must** be replaced as a set.

Note : For more detailed information of bearing damage, see Service Bulletin, Analysis and Prevention of Bearing Failures, Bulletin 3810387 (/qs3/pubsys2/xml/en/bulletin/3810387.html).

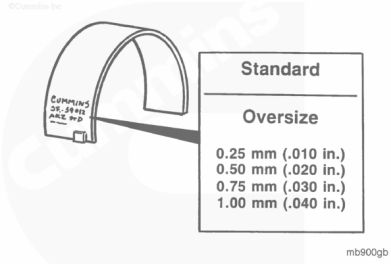
Measure the rod bearing shell thickness with an outside micrometer that has a ball tip.



Connecting Rod Bearing Dimensions			
	mm		in
Standard	2.457	MIN	0.0968
	2.469	MAX	0.0972

Discard a bearing shell if its thickness is below the minimum specification.

Note : Connecting rod bearings are identified with a part number and size stamped on the back side.

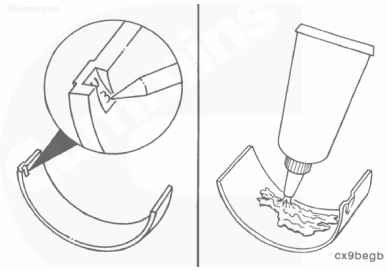


Determine the size of the removed rod bearing. Obtain a set of the same size.

Oversize service rod bearings are available for use with crankshafts machined undersize. See the appropriate parts catalog.

Install

For connecting rod bearing installation instructions use the following. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan and gasket. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Fill the lubricating oil pan. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

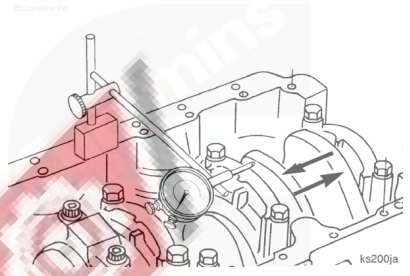
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)

Initial Check



The thrust bearing consists of an upper bearing shell and two thrust flanges. The thrust flanges are spot welded for ease of assembly and designed to separate from the bearing shell during engine operation.

The dimensions of the thrust bearing and crankshaft journal determine end clearance.

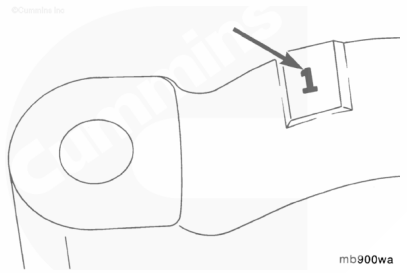
Note : If performing a bearing inspection while the engine is in chassis, avoid removing the thrust bearing. If the thrust bearing is removed for inspection, it **must** be replaced with a new thrust bearing.

Measure the crankshaft end clearance. Use dial indicator, Part Number 3824564, and magnetic base, Part Number 3377399, or equivalent.

Crankshaft End Clearance Limits		
mm		in
0.085	MIN	0.003
0.385	MAX	0.015

If the crankshaft end clearance is **not** within specification, make sure to inspect the crankshaft and thrust bearing surfaces for damage.

Remove

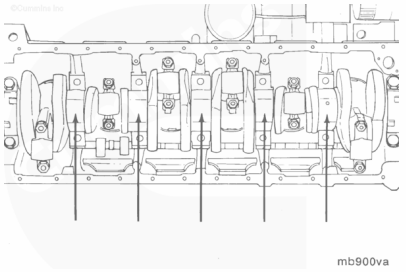


Before removing the main bearing caps, make certain the caps are clearly marked for their location on the intake side of the main bearing cap.

The number one cap is at the front of the engine.

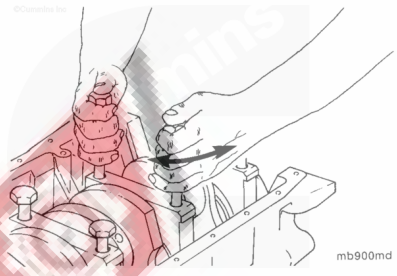
When replacing bearings in chassis, replace number 2 through number 6 while the number 1 and number 7 caps support the crankshaft. After replacing number 2 through number 6, replace number 1 and number 7.

Remove all main bearing caps except the number 1 and number 7 main bearing caps.



⚠ CAUTION ⚠

Do not pry on the main bearing caps to free them from the cylinder block. Damage to the main bearing caps and cylinder block can result.



Loosen the main bearing capscrews completely, but do **not** remove.

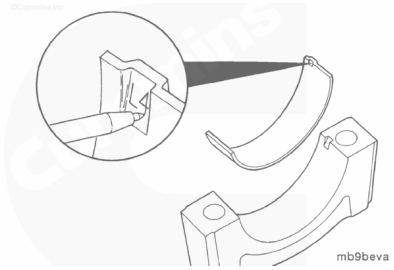
Use two of the main bearing cap bolts to wiggle the main bearing cap loose, being careful **not** to damage the bolt threads.

Remove the main bearing cap.

Mark the main bearings for position and number as they are removed.

Mark the bearing position in the tang area. Use an awl.

Note : Marking the bearing position is for future identification or possible future analysis.



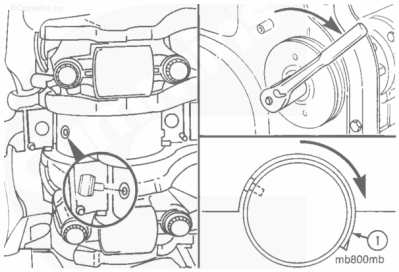
To remove the upper main bearings, install main bearing replacer, Part Number 3823818, in the oil hole of the crankshaft main bearing journal.

Rotate the crankshaft so the replacer contacts the upper main bearing on the side opposite the tang.

Continue to rotate the crankshaft in the direction that will remove the tang side (1) of the upper main bearing first.

Remove the bearing.

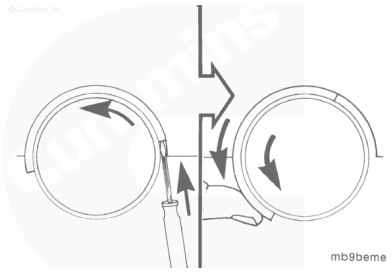
Follow this procedure to remove the other main bearings except for number 1 front main bearing.



ANADOLU ISUZU AFTER SALES

⚠ CAUTION ⚠

Use care so the screwdriver does not damage the crankshaft or cylinder block.



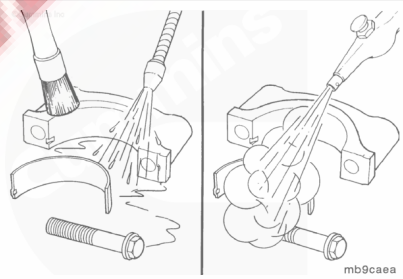
Note : The front main bearing, number 1, does **not** have a hole in the journal, so the tool can **not** be used to replace the bearing.

Use a flat blade screwdriver to gently bump the end of the bearing to loosen it from the cylinder block. Then, use finger pressure against the main bearing shell and rotate the crankshaft to roll the main bearing out.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



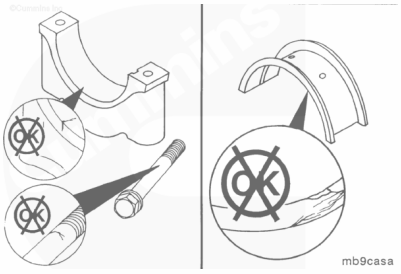
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the main bearing caps. Use steam. Dry with compressed air.

Inspect all main bearing caps and main bearing crankshaft journals for deep scoring, overheating, etc.

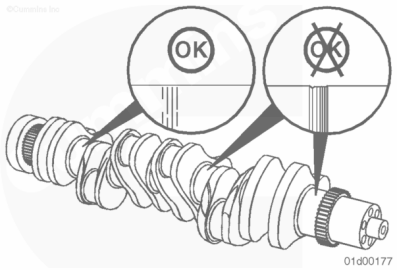
Replace any damaged components. If the main bearing cap is damaged, the block **must** be replaced.



Check the crankshaft main bearing journals for damage or excessive wear. Minor scratches are acceptable.

ANADOLU ISUZU PARTS SALES

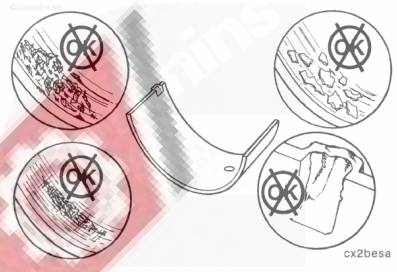
If crankshaft end clearance measured during the initial check was found to be out of specification, make sure to inspect the crankshaft thrust surface for excessive wear or damage. Minor scratches are acceptable.



If damage is found, the crankshaft **must** be removed. Refer to Procedure 001-016 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-016.html)

Also inspect the thrust bearing surfaces for excessive wear. Replace the thrust bearing(s) if excessive wear is found.

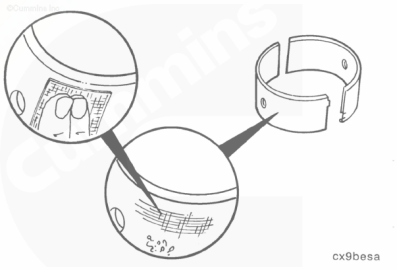
Inspect the bearings for damage.



Replace any bearings with the following damage:

- Pitting
- Flaking
- Corrosion
- Lock tang damage
- Scratches.

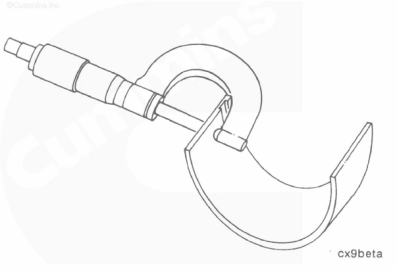
Inspect the bearing shell seating surfaces for nicks or burrs. If nicks or burrs can **not** be removed with abrasive pad, Part Number 3823258, or equivalent, the bearings **must** be replaced.



Note : If bearings are damaged, they **must** be replaced as a set.

Note : For more detailed information on bearing damage, see Analysis and Prevention of Bearing Failures, Bulletin 3810387.

Measure the main bearing shell thickness with an outside micrometer that has a ball tip.



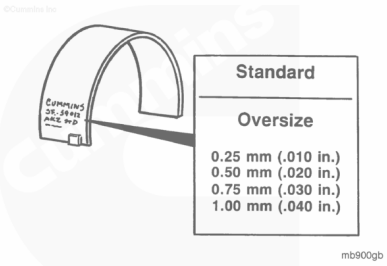
Main Bearing Dimensions			
	mm		in
Standard	3.446	MIN	0.1357
	3.454	MAX	0.1360

Discard a bearing shell if its thickness is below the minimum specification.

Note : Main bearings are identified with a part number and size stamped on the back side.

If replacing the bearings, determine the size of the removed main bearings. Obtain a set of the same size.

Oversize service main bearings are available for use with crankshafts machined undersize. See the appropriate parts catalog.



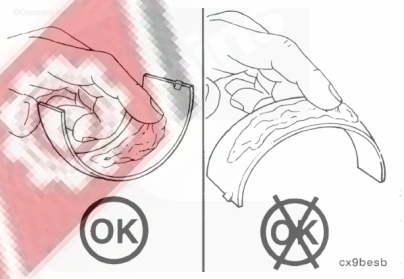
Install

Upper Main Bearings

Do **not** lubricate the side against the cylinder block.

Note : Make sure the main bearing being installed is same size as the main bearing removed. The size is engraved on the back of the main bearing.

Apply a coat of assembly lubricant, Part Number 3163086, or equivalent, to the crankshaft side of the main bearings.



Note : For in-chassis bearing replacement, it can be necessary to use clean engine oil to lubricate the bearing shell.

Note : The crankshaft thrust bearing **must** be installed in the number four position.

Note : The upper and lower main bearing shells of some engines are **not** interchangeable. The backs of the main bearings are marked with the proper orientation, if required.

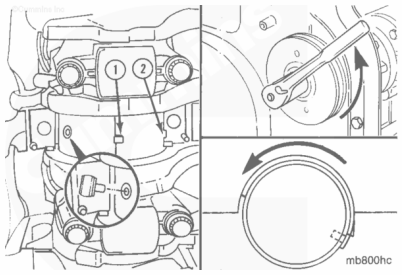
Insert the side of the main bearing opposite the tang first. Install as far as possible by hand.

When installing the thrust bearing in the number four journal, it could be necessary to push the crankshaft to the front or rear of the cylinder block.

If reuse guidelines are met for the thrust bearing and the crankshaft has been removed, the thrust bearing can be reused. To aid in assembly, add assembly lubricant, Part Number 3163087, to the back of thrust flanges to help hold them in place.

If the crankshaft has **not** been removed, a new thrust bearing **must** be used.

Follow this step to finish installing the upper main bearings, except for number 1 front main bearing.



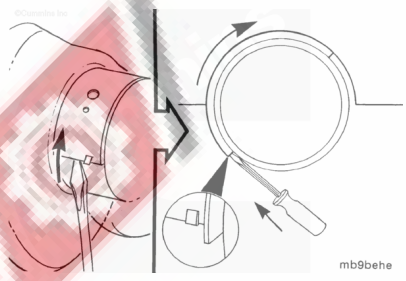
Make sure the pin does not slide under the bearing.

Use main bearing replacer, Part Number 3823818, to finish installing the main bearing by rotating the crankshaft. Rotate the crankshaft. Use barring tool, Part Number 3824591.

Make sure the tang (1) on the main bearing is located in the notch (2) of the cylinder block.

Finish pushing the main bearing into position.

Note : The front main, number 1, does **not** have a hole in the journal so the pin can **not** be used to replace the bearing.



Lubricate and install the number 1 main bearing.

Insert the side of the main bearing opposite the tang first. Install as far as possible by hand.

Use the screwdriver to push the main bearing into position as you rotate the crankshaft.

Lower Main Bearings

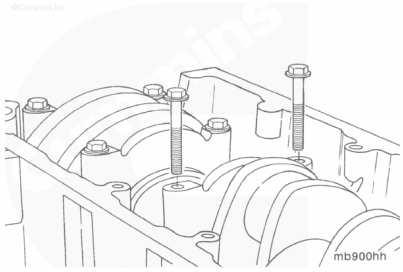
The backside of the bearings **must** be clean and free of debris.

Install the lower main bearings into the main bearing caps.

Align the tangs of the bearings with the tangs on the main bearing caps.

Apply a coat of assembly lubricant, Part Number 3163086, or equivalent, to the crankshaft side of the main bearings.

Note : The main bearing caps are numbered for location. Number 1 starts with the front of the block. Install the cap so numbers face the intake side of the engine.



The main bearing cap surfaces between the main bearing cap and block **must** be clean and free of debris.

Install a main bearing cap after each upper main bearing is installed to keep the main bearing in place while the other uppers are installed.

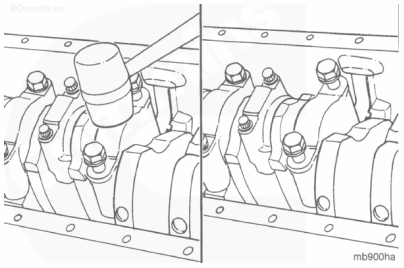
Lubricate the main bearing capscrew under the cap. Lubricate the main bearing capscrew threads. Use clean engine oil.

Gently tap the main bearing cap into position with a plastic or rubber mallet.

When seated, install the main bearing capscrews. Tighten.

Torque Value: 50 n•m [37 ft-lb]

Do **not** tighten to the final torque value at this time. The final torque **must** be applied after all main bearing caps are installed.

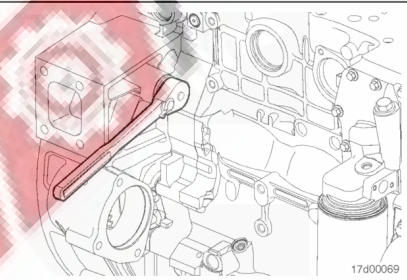


Use barring tool, Part Number 5299073, to make sure the crankshaft rotates freely after installing the main bearing caps.

While applying final torque to the main bearing capscrews, frequently check that the crankshaft rotates freely.

If the crankshaft does **not** rotate freely:

1. Confirm the crankshaft is **not** contacting one of the connecting rods.
2. Confirm the correct main bearing caps were installed correctly.
3. Confirm the main bearing cap ring dowels or mounting surfaces were **not** damaged during installation.
4. Confirm the correct main bearings were installed.

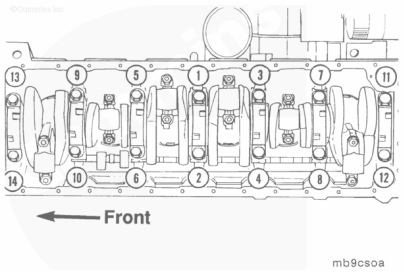


Tighten the main bearing capscrews evenly and in sequence.

Torque Value:

1. 170 n•m [125 ft-lb]
2. Loosen all capscrews.
3. 50 n•m [37 ft-lb]
4. Rotate 120 degrees.

Check the main bearing installation and the size of the main bearings if the crankshaft does **not** rotate freely.

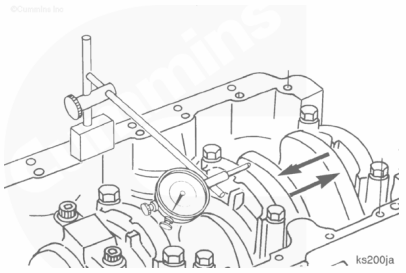


The dimensions of the thrust bearing and crankshaft journal determine end clearance.

Measure the crankshaft end clearance. Use dial indicator, Part Number 3824564, and magnetic base, Part Number 3377399.

ANADOLU ISUZU PARTS SALES

Crankshaft End Clearance Limits		
mm		in
0.085	MIN	0.003
0.385	MAX	0.015



If the crankshaft end clearance is **not** within specification:

1. If the crankshaft end clearance is below specification, check if there are any obstructions limiting crankshaft travel (lubricating oil pump, connecting rod, etc.)
2. If the crankshaft end clearance is above specification, inspect the crankshaft thrust bearing surface. Also, check if the correct thrust bearing(s) were installed.

Note : Oversize thrust bearings are available if the end clearance is **not** within specifications. See the appropriate parts catalog.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan and gasket. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Fill the lubricating oil pan. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Preparatory Steps

⚠ WARNING ⚠

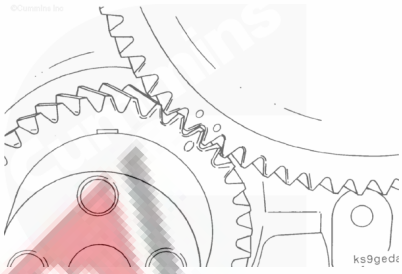
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the engine brakes, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Remove the rocker lever housing, if equipped. Refer to Procedure 003-013 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-013.html)
- Remove the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Remove the push rods. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)

- Raise the tappets. Refer to Procedure 004-015 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-015.html)

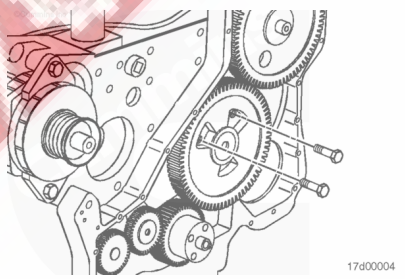
Remove

Rotate the crankshaft to align the crankshaft to camshaft timing marks.



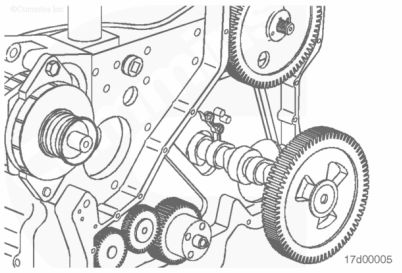
Note : Because the thrust plate extends more than 180 degrees around the camshaft, the thrust plate can **only** be removed from the camshaft after removing the cam gear from the camshaft.

Remove the capscrews from the thrust plate.



Remove the camshaft and thrust plate together.

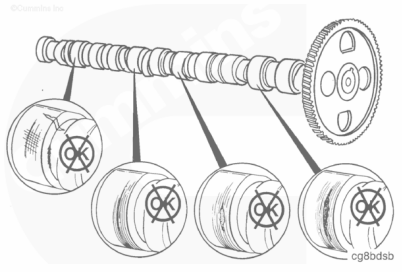
Note : Rotate the camshaft as it is being removed. Use extreme care to make sure the camshaft bushings are **not** damaged during the camshaft removal process.



Clean and Inspect for Reuse

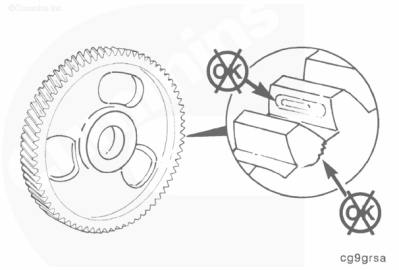
Inspect the valve lobes and bearing journals for cracking, pitting, and scoring.

See Service Bulletin, Camshaft Reuse Guidelines for Cummins® Engines with Roller Followers or Roller Tappets, Bulletin 3666052. (/qs3/pubsys2/xml/en/bulletin/3666052.html)



See Service Bulletin, Camshaft and Tappet Reuse Guidelines, Bulletin 3666475. (/qs3/pubsys2/xml/en/bulletin/3666475.html)

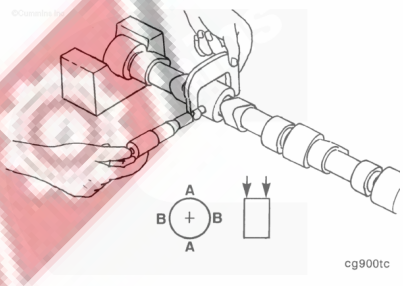
Inspect the camshaft gear. Replace if necessary. Refer to Procedure 001-013 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-013.html)



Note : Replace the camshaft if the outside diameter of any bearing surface is less than 59.962 mm [2.3607 in].

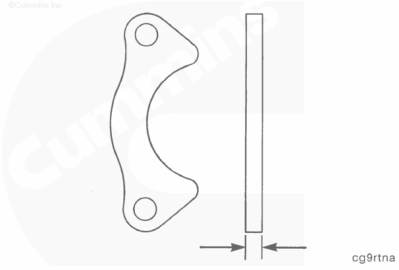
Measure the bearing journals.

Measure the seven camshaft bushing journals.



Camshaft Bearing Journal Diameter		
mm		in
59.962	MIN	2.3607
60.013	MAX	2.3627

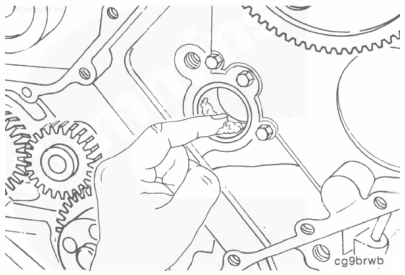
Measure camshaft thrust plate thickness.



Camshaft Thrust Plate		
mm		in
9.40	MIN	0.370
9.60	MAX	0.378

Install

Apply a coat of assembly lubricant, Part Number 3163087, or equivalent, to the front camshaft bore.



ANADOLU ISUZU GLOBAL SALES

Lubricate the camshaft lobes, journals and thrust plate. Use assembly lubricant, Part Number 3163087, or equivalent.

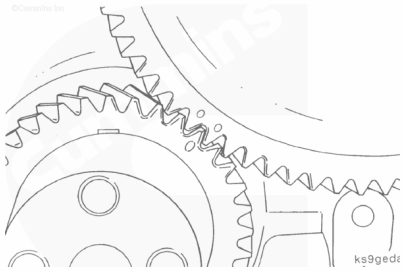
⚠ CAUTION ⚠

Do not try to force the camshaft into the camshaft bore as damage to the camshaft bushing can result.

Install the camshaft. While pushing in slightly, rotate the camshaft and carefully work the camshaft through the camshaft bushings. As each camshaft journal passes through a bushing, the camshaft will drop slightly and the camshaft lobes will catch on the bushings. Rotating the camshaft will free the lobe from the bushing and allow the camshaft to be installed.

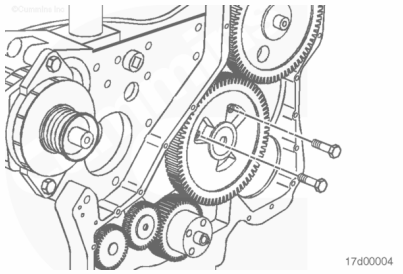
Before the camshaft gear engages the crankshaft gear, check the camshaft for ease of rotation. When installed properly, the camshaft **must** rotate freely.

Align the timing marks as illustrated. Finish installing the camshaft.



Install the thrust plate capscrews.

Torque Value: 24 n•m [212 in-lb]



Use gauge, Part Number 3824564, and magnetic base, Part Number 3377399, to verify the camshaft has proper end clearance and backlash.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Install the rubber vibration damper, if removed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Install the viscous vibration damper, if removed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Release the tappets. Refer to Procedure 004-015 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-015.html)
- Install the push rods. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Install the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Adjust the valve lash. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Additional Service Items

- Felt tip pen

General Information

The engine has seven camshaft bushings, starting with camshaft bushing 1 at the front of the engine.

Camshaft bushings 1 through 6 can be replaced through the front of the engine by driving them towards the rear of the engine.

Replacing camshaft bushing 7 requires the flywheel housing and the cup plug at the rear face of the block adjacent to the camshaft be removed to drive camshaft bushing 7 forward for replacement.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

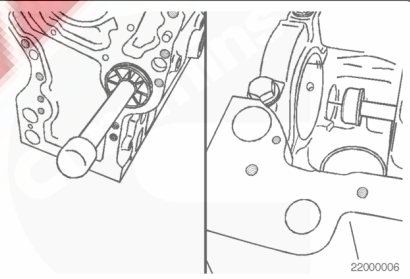
- Disconnect the batteries. See equipment manufacturer service information.
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Drain the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)

ANADOLU ISUZU PARTS FILES

- Remove the starting motor. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
- Remove the flexplate, if installed. Refer to Procedure 016-004 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-004.html)
- Remove the flywheel, if installed. Refer to Procedure 016-005 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-005.html)
- Remove the flywheel housing. Refer to Procedure 016-006 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-006.html)
- Remove the camshaft. Refer to Procedure 001-008 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-008.html)
- Remove the rear camshaft cup plug. Refer to Procedure 017-002 in Section 17. (/qs3/pubsys2/xml/en/procedures/425/425-017-002.html)

Remove

Remove the camshaft bushings. Use Camshaft Bushing Replacer Kit, Part Number 3165045.



The following kits are also available for camshaft bushing installation and removal:

- Hydraulic Actuator Kit, Part Number 3823621.
- Camshaft Bushing Kit, Part Number 3162253.

Slide the drive bar through the centering guide and insert the drive bar from the rear of the cylinder block through the camshaft bores.

Insert the camshaft bushing replacer and drive the front camshaft bushing from the cylinder block.

Remove the replacer and drive bar from the cylinder block.

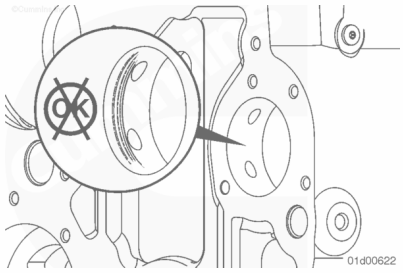
Insert the drive bar, camshaft bushing replacer, and centering guide from the front of the cylinder block.

Drive the remaining camshaft bushings from the cylinder block in succession, starting with the number 2 camshaft bushing.

Remove the drive bar, replacer, and guide from the front of the cylinder block.

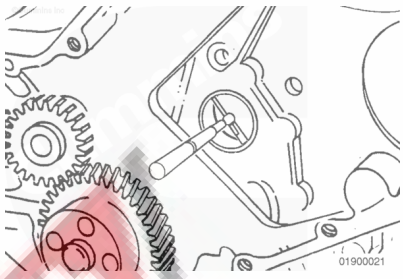
Clean and Inspect for Reuse

Inspect the camshaft bore for damage and excessive wear. Refer to Procedure 001-026 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-026.html)



Measure the camshaft bore.

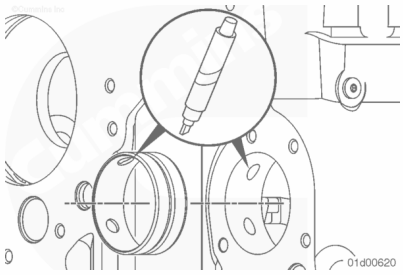
Camshaft Bore Diameter (Maximum)				
	mm		in	
Without bushing		64.013	MAX	2.5202
With bushing		60.120	MAX	2.3669



Install

Mark the oil holes on the camshaft bushing and cylinder block with a felt tip pen. This aids proper alignment of the bushing and bore during installation.

Note : The top hole on the front and rear camshaft bushings will **not** line up with the top hole of the cylinder block bores. **Only** the bottom hole will line up for the front and rear camshaft bushings.

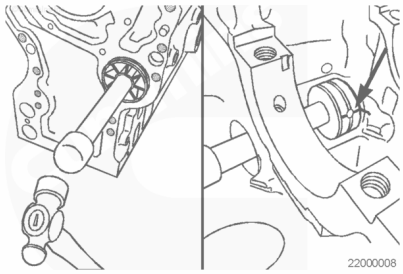


Slide the camshaft bushing on the replacer. Position the notch on the edge of the bushing to the top rear of the block. Align the marks on the camshaft bushing and cylinder block.

Drive the rearmost camshaft bushing to the correct installed depth. The correct installed depth is when the camshaft bushing oil hole aligns with the cylinder block oil hole.

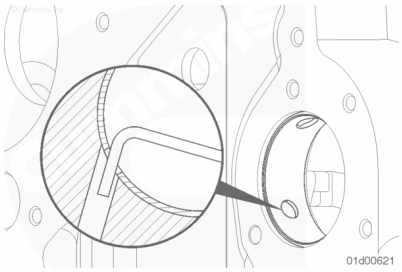
Install the remaining camshaft bushings in succession, starting at the rear of the cylinder block and working toward the front.

Remove the drive bar, replacer, and guide from the cylinder block.



Make sure the lubricating oil holes in the camshaft bushing are aligned with the oil holes in the camshaft bore. For the front and rear camshaft bushings, **only** the bottom hole will line up with the hole in the cylinder block.

A 3.2 mm [0.128 in] diameter rod **must** be able to pass through the lubricating oil holes.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the rear camshaft cup plug. Refer to Procedure 017-002 in Section 17. (/qs3/pubsys2/xml/en/procedures/425/425-017-002.html)
- Install the camshaft. Refer to Procedure 001-008 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-008.html)
- Install the flywheel housing. Refer to Procedure 016-006 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-006.html)
- Install the flexplate, if installed. Refer to Procedure 016-004 in Section 16, if installed. (/qs3/pubsys2/xml/en/procedures/425/425-016-004.html)
- Install the flywheel, if installed. Refer to Procedure 016-005 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-005.html)
- Install the starting motor. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
- Install the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Fill the lubricating oil system. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)

ANADOLU ISUZU AFTER SALES

- Loosen the rocker lever assemblies. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)

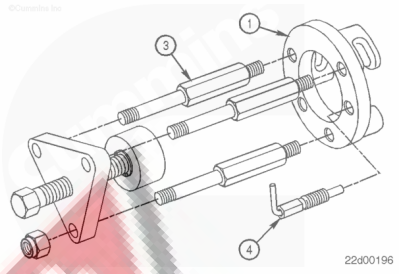
Remove

Use camshaft gear removal and installation tool, Part Number 3163054, and camshaft gear installation and removal tool, Part Number 3165093, or equivalent, to remove the camshaft gear from the camshaft.

Install the studs (3) into the gear remover (1). Hand tighten the studs.

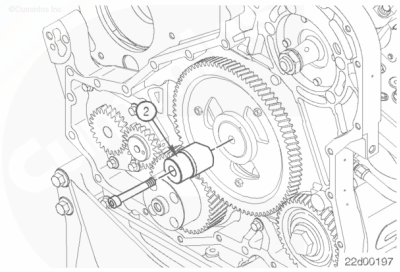
Install the replacer screw assembly on the studs. Install nuts, Part Number 3164753, onto the studs. Hand tighten.

Install the spring plungers (4), if required.



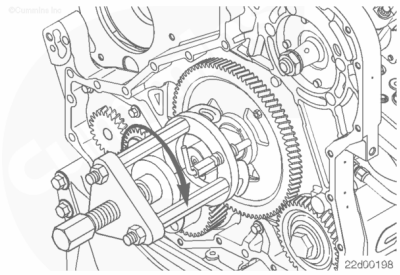
Loosen the thrust plate capscrews approximately two turns. Rotate the camshaft gear until the keyway is located at the 1 o'clock position.

Place the camshaft pilot (2) on the end of the camshaft. Install the socket head capscrew. Hand tighten.



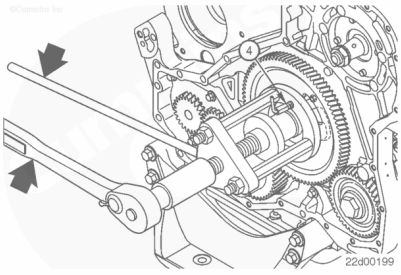
Install the camshaft gear replacer assembly onto the camshaft gear.

Rotate **clockwise** until the camshaft gear replacer assembly is fully engaged in the camshaft gear slots.



Install handle, Part Number 3164907, in the replacer screw assembly.

Using a wrench, turn the replacer screw **clockwise** while holding the handle to prevent gear rotation. Remove the camshaft gear.

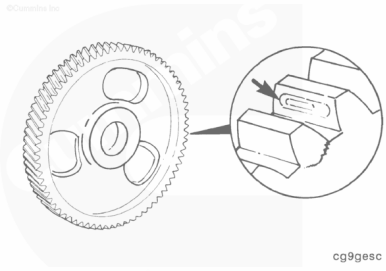


Clean and Inspect for Reuse

Inspect the camshaft gear for cracked, chipped, or broken teeth.

Inspect the camshaft bore for fretting or burrs.

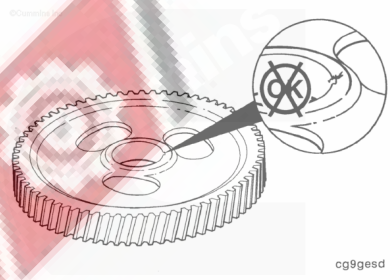
Note : If the fretting, burrs, or raised material can **not** be removed with abrasive pad, Part Number 3823258, or equivalent, replace the camshaft gear.



Inspect the camshaft gear keyway for burrs.

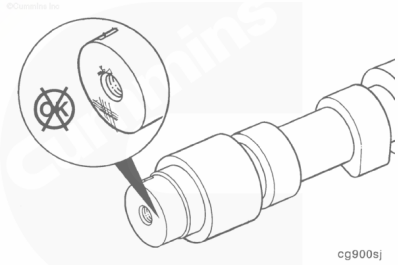
Remove burrs. Use abrasive pad, Part Number 3823258, or equivalent.

Note : If the keyway is damaged or the burrs can **not** be removed, the camshaft gear **must** be replaced.



Inspect the camshaft nose for fretting or burrs.

Note : If fretting or burrs can **not** be removed with abrasive pad, Part Number 3823258, or equivalent, replace the camshaft. Refer to Procedure 001-008 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-008.html)



Install

Lubricate the camshaft surface. Use assembly lubricant, Part Number 3163087, or equivalent.

Install the key into the camshaft nose.

Tighten the thrust plate capscrews.

Torque Value: 24 n•m [212 in-lb]

⚠ CAUTION ⚠

The camshaft gear will be permanently distorted if overheated. The oven temperature should never exceed 204°C [400°F].

Heat the camshaft gear for 45 minutes.

Measurements		
	celsius	fahrenheit
Oven Temperature	204	400

Use camshaft gear removal and installation tool, Part Number 3163054, and puller assembly, Part Number 3165093, or equivalent, to install the camshaft gear onto the camshaft.

Wear protective gloves to reduce the possibility of personal injury when handling parts that have been heated.

Install the camshaft gear with the timing marks away from the camshaft.

Note : Make sure the gear is seated against camshaft shoulder.

Use a 0.02 mm [0.001] feeler gauge, to see if the feeler gauge can be inserted between the camshaft gear and the shoulder on the camshaft. Insert the feeler gauge in multiple locations. If the feeler gauge can be inserted, the camshaft gear is **not** properly seated.

Use dial indicator assembly, Part Number 3824564, and magnetic base, Part Number 3377399, or equivalent, to verify the camshaft has proper backlash and end clearance.

Camshaft End Clearance (A)		
mm		in
0.12	MIN	0.005
0.50	MAX	0.020

Camshaft Gear Backlash Limits (B)		
mm		in
0.08	MIN	0.003
0.33	MAX	0.013

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the gear cover. Refer to Procedure 001-031in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)

- Install the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Tighten the rocker lever assemblies. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Adjust the valve lash. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Connect the batteries. See equipment manufacturers service information.
- Operate the engine. Check for proper operation.

ANADOLU DİESEL

Select Service Tools

Recommended Cummins® Service Tools

- Abrasive pad, Part Number 3823259, or equivalent
- Assembly lubricant, Part Number 3163087, or equivalent

Additional Service Items

- Feeler gauge

Preparatory Steps

⚠ WARNING ⚠

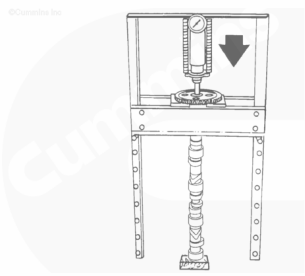
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the camshaft. Refer to Procedure 001-008 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-008.html)

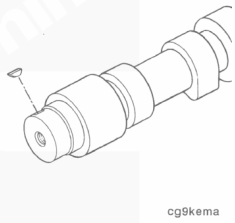
Remove

Remove the gear by using a press.

Remove the thrust plate.



Remove the camshaft key.



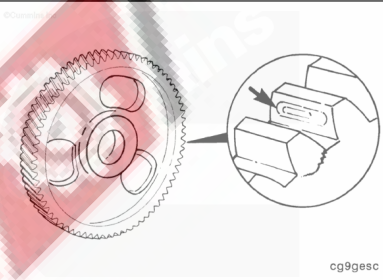
cg9kema

Clean and Inspect for Reuse

Inspect the camshaft gear for cracked, chipped, or broken teeth.

Inspect the camshaft bore for fretting or burrs.

Note : If the fretting, burrs, or raised material can **not** be removed with abrasive pad, Part Number 3823258, or equivalent, replace the camshaft gear.

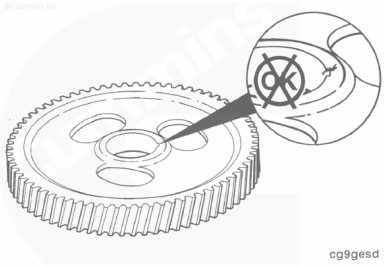


cg9gesc

Inspect the camshaft gear keyway for burrs.

Remove burrs. Use abrasive pad, Part Number 3823258, or equivalent.

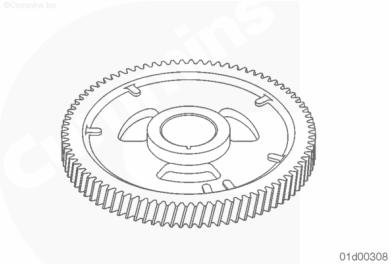
Note : If the keyway is damaged or the burrs can **not** be removed, the camshaft gear **must** be replaced.



cg9gesd

Inspect the camshaft gear and speed sensor targets.

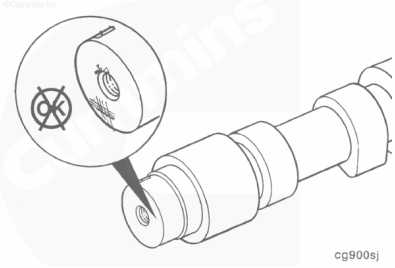
Replace the camshaft gear if any damage is found.



01d00308

Inspect the camshaft nose for fretting or burrs.

Note : If fretting or burrs can **not** be removed with abrasive pad, Part Number 3823258, or equivalent, replace the camshaft.

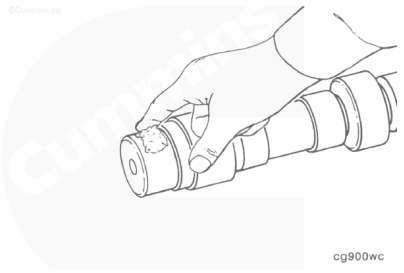


cg900sj

ANADOLU ISUZU PARTS

Install

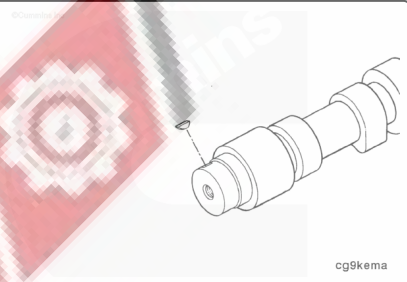
Lubricate the camshaft surface. Use assembly lubricant, Part Number 3163087, or equivalent.



Install the key.

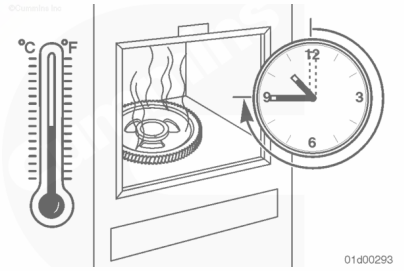
Install the thrust plate.

Note : Because the thrust plate extends more than 180 degrees around the camshaft, the thrust plate **must** be installed before installing the cam gear on the camshaft.



⚠ CAUTION ⚠

The camshaft gear will be permanently distorted if overheated. The oven temperature should never exceed 204°C [400°F].

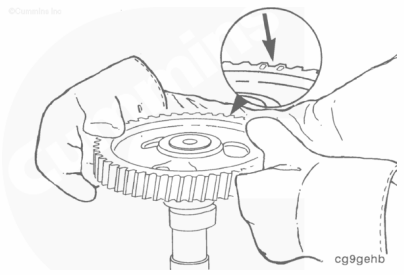


Heat the camshaft gear for 45 minutes.

Measurements		
	celsius	fahrenheit
Oven Temperature	204	400

⚠ WARNING ⚠

To reduce the possibility of personal injury, wear protective gloves when handling parts that have been heated.



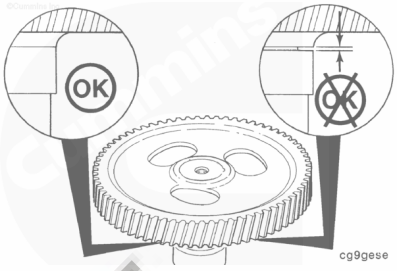
Note : When clamping the camshaft to install the gear, do **not** place clamps directly on the camshaft lobes or journals, which could damage the surfaces. Clamp **only** the cast surfaces between the lobes, or

place padding between the clamps and the camshaft surfaces.

Install the camshaft gear with the timing marks away from the camshaft.

Note : Make sure the gear is seated against camshaft shoulder.

Use a 0.02 mm [0.001 in] feeler gauge, to see if the feeler gauge can be inserted between the camshaft gear and the shoulder on the camshaft. If the feeler gauge can be inserted, the camshaft gear is **not** properly seated.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the camshaft. Refer to Procedure 001-008 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-008.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

General Information

The engine uses straight (horizontal) fracture-split connecting rods.

Connecting rods with a fracture-split or serrated surface **must** be treated with caution. The two pieces of the connecting rod can **not** be rubbed together, as this will damage the mating surfaces. Use care to **not** drop either piece of the connecting rod.

The connecting rods can **not** be mixed with previous product for ISC/ISL engines.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

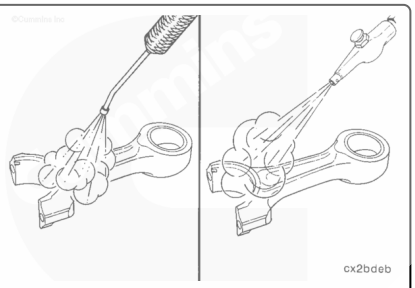
Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Remove the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Remove the lubricating oil pan and gasket. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Remove the piston cooling nozzles. Refer to Procedure 001-046 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-046.html)
- Remove the piston and connecting rod, and disassemble. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

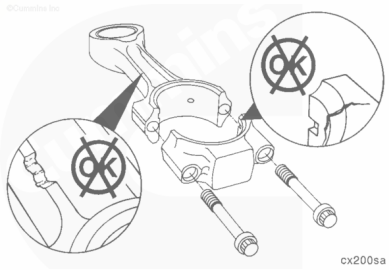
Clean the oil drillings. Use a nylon bristle brush.

Clean the connecting rods. Use steam or solvent.

Dry with compressed air.

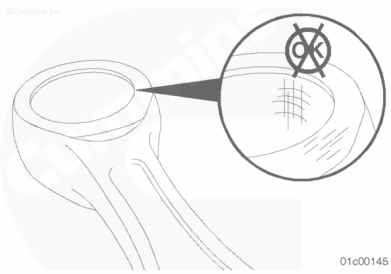
Inspect the connecting rods and connecting rod caps for damage.

Replace the connecting rod if the “I-beam” is nicked or otherwise damaged.



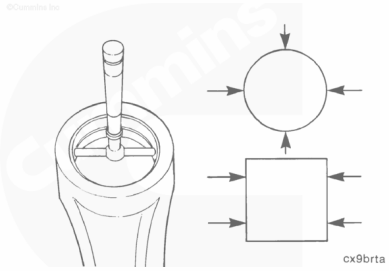
Inspect the piston pin bore for damage or misalignment of the oil passage and bushing.

Replace the connecting rod if any damage is found.



Measure the connecting rod piston pin bushing inside diameter.

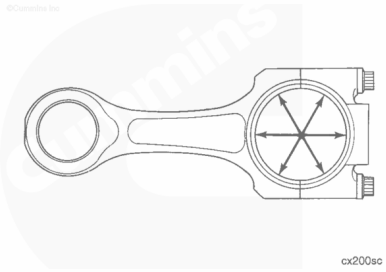
Connecting Rod Piston Pin Bushing Diameter		
mm		in
45.023	MIN	1.7726
45.035	MAX	1.7730



ANADOLU ISUZU DEALER SALES

If the connecting rod piston pin bushing inside diameter is out of specification, replace the connecting rod.

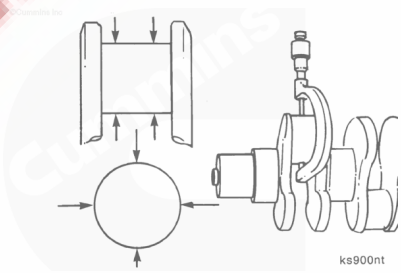
Measure the connecting rod crankshaft bore with the bearing shells removed and the caps tightened to the proper torque value. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)



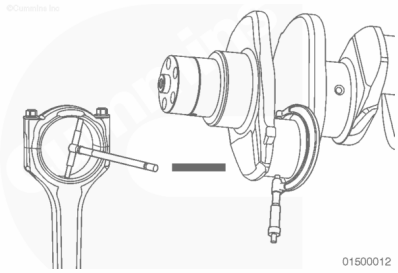
Connecting Rod Crank Bore Diameter (Bearings Removed)		
mm		in
80.987	MIN	3.1885
81.013	MAX	3.1895

If the connecting rod crank bore diameter is out of specification, replace the connecting rod.

Measure the diameter of the rod journal on the crankshaft. Refer to Procedure 001-016 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-016.html)



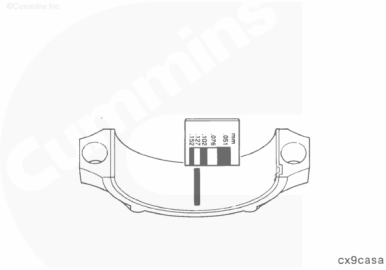
Bearing Clearance		
mm		in
0.038	MIN	0.0015
0.116	MAX	0.0045



Bearing clearance: rod inside diameter (with bearing) minus crankshaft journal diameter.

Bearing clearance can also be determined with a plastigauge during engine assembly.

Note : If the clearance is found to be out of specification, replace or try another set of connecting rod bearings.



ANADOLU ISUZU GENUINE SALES

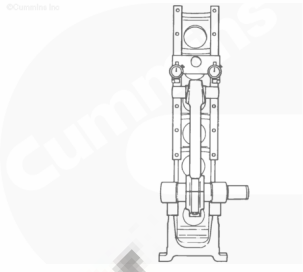
Bend and Twist Inspect

Calibration Procedure

Use connecting rod checking fixture, Part Number ST 561, and connecting rod mandrel set, Part Number 3823286, to inspect the bend and twist of the rods.

Calibrate the checking fixture with a new rod measured for correct center to center length, 215.975 to 216.025 mm [8.5029 to 8.5040 in].

Assemble the connecting rod cap to the rod, as described previously in this procedure.

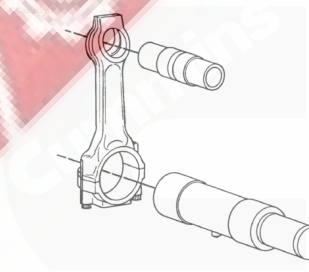


Install the piston pin mandrel from mandrel set, Part Number 3823286, into the piston pin bore.

Note : Use mandrel, Part Number 3823283, if a piston bushing has been removed or mandrel, Part Number 3823284, if the bushing is still in place.

Install mandrel, Part Number 3823303, into the crankshaft bore and expand the mandrel.

Note : Make sure the pin on the mandrel is down and locked in position in the center of the connecting rod.

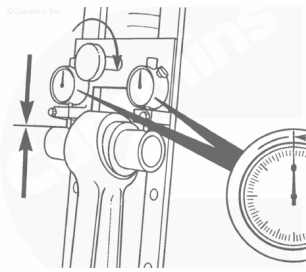


Install the connecting rod into the fixture.

Move the dial holder to position the contact points of the indicators on the mandrel in the piston pin bore.

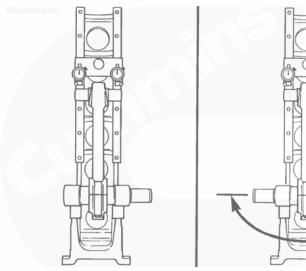
Tighten the bracket to hold the indicators in position.

Set the dial indicators to zero.



Remove the connecting rod from the fixture.

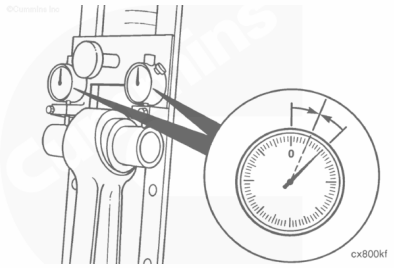
Turn the rod 180 degrees horizontally. Install the rod into the fixture again.



Check the dial indicators for zero position again.

If the dial indicators show any change from zero, adjust the dials to half the indicated reading.

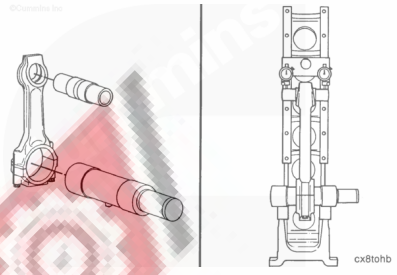
The fixture is now calibrated to allow the connecting rod to be installed into the fixture in either direction. The dials will indicate an equal defection on either side or zero.



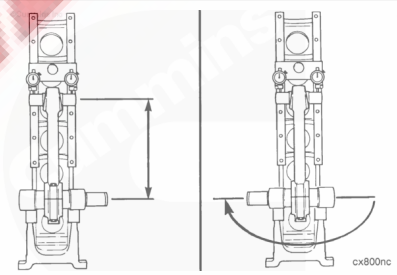
Test

Install the mandrel and arbor into the connecting rod to be inspected.

Install the connecting rod into the fixture.



Measure the connecting rod length and bend (alignment).



Straight Split Connecting Rod Length		
mm		in

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Assemble and install the pistons and connecting rod assemblies. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)
- Install the piston cooling nozzles. Refer to Procedure 001-046 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-046.html)
- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan and gasket. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Install the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Fill the lubricating oil system. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Recommended Cummins® Service Tools

- Nylon lifting sling, Part Number 2892501
- Threaded Insert Kit, Part Number 3822709
- Assembly lubricant, Part Number 3163087, or equivalent
- Barring tool, Part Number 3824591, or equivalent

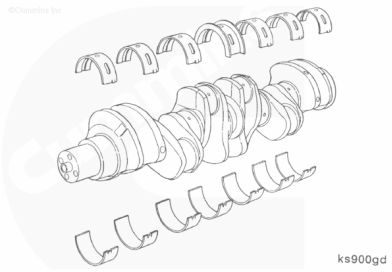
Additional Service Items

- Hoist
- Awl
- Fine crocus cloth
- Mircometer

General Information

The crankshaft uses forged counterweights.

Oversize main bearings, thrust bearings, and connecting rod bearings are available for service. Cummins Inc. recommends regrinding all main or the connecting rod journals when one requires regrinding. See the appropriate parts catalog.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the battery. See equipment manufacturer service information.
- Remove the engine and place on an engine stand. Refer to Procedure 000-001 in Section 0. (/qs3/pubsys2/xml/en/procedures/425/425-000-001.html)

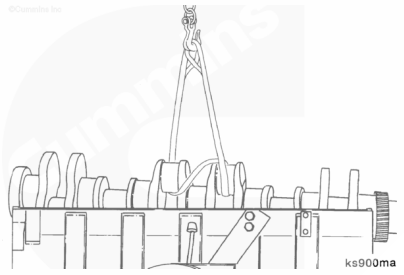
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the front cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Remove the starting motor. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
- Remove the flexplate, if installed. Refer to Procedure 016-004 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-004.html)
- Remove the flywheel, if installed. Refer to Procedure 016-005 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-005.html)
- Remove the flywheel housing. Refer to Procedure 016-006 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-006.html)
- Remove the rear crankshaft seal carrier. Refer to Procedure 001-067 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-067.html)
- Remove the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Remove the fuel pump. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)
- Remove the air compressor, if required. Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)
- Remove the camshaft gear. Refer to Procedure 001-012 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-012.html)
- Remove the front gear housing. Refer to Procedure 001-033 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-033.html)
- Remove the connecting rod caps. Refer to Procedure 001-005 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-005.html)
- Remove the main bearing caps. Refer to Procedure 001-006 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-006.html)

Remove

Note : Lift the crankshaft straight up to avoid damage to the crankshaft and cylinder block.

Install nylon lift sling, Part Number 2892501, around the number 3 and number 4 rod bearing journals.

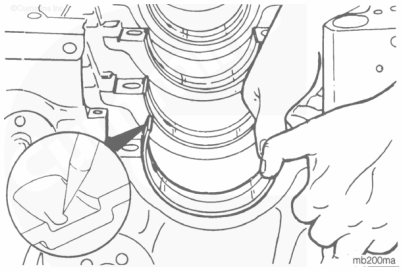
Attach the sling to a hoist. Remove the crankshaft.



Note : Mark the bearing position for future identification or possible failure analysis.

Remove the upper main bearings.

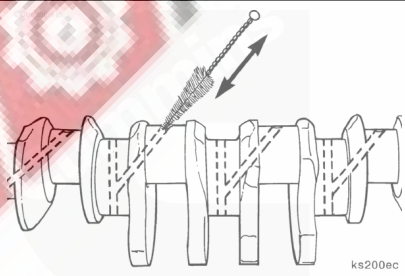
Use an awl to mark the bearing position in the tang area.



Clean and Inspect for Reuse

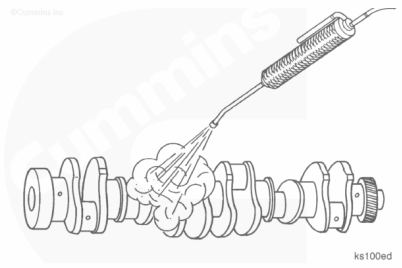
Polish the machined surfaces. Use fine crocus cloth.

Clean the oil drillings. Use a bristle brush.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the crankshaft. Use steam. Dry with compressed air.

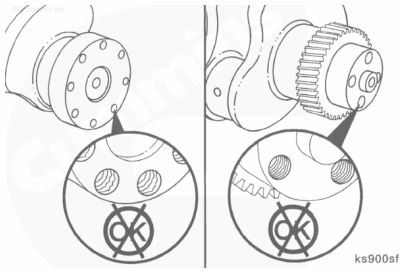
Make sure to blow out the threaded holes on each end of the crankshaft and oil drillings.

Inspect the threaded capscrew holes for damage.

Use one of the following methods to repair any damaged threaded holes:

- Chase the threads.
- Use Threaded Insert Kit, Part Number 3822709.

Note : A maximum of one front crankshaft threaded hole and three rear crankshaft holes can be repaired. If more than one threaded hole in the front of the crankshaft or three threaded holes in the rear of the crankshaft requires repair, the crankshaft can **not** be salvaged.



Measure the front and rear oil seal contact areas for a wear groove.

Crankshaft Front and Rear Oil Seal Wear Groove		
mm		in
0.25	MAX	0.010

Inspect the crankshaft connecting rod and main journals for deep scoring, overheating, etc. Minor scratches are acceptable.

Measure the connecting rod journals. Use a micrometer.

Crankshaft Connecting Rod Journal Diameter		
mm		in
76.000	MIN	2.9921
76.026	MAX	2.9931

Crankshaft Connecting Rod Out of Roundness		
mm		in
0.050	MAX	0.002

Crankshaft Connecting Rod Journal Taper		
mm		in
0.013	MAX	0.0005

Note : If the crankshaft connecting rod journals are **not** within the given specifications, the crankshaft **must** be reground. Always grind all journals when one is **not** within specifications. Oversize connecting rod bearings are available; see the appropriate parts catalog.

Measure the crankshaft main bearing journals. Use a micrometer.

Crankshaft Main Bearing Journal Diameter		
mm		in
97.987	MIN	3.8585
98.013	MAX	3.8595

Crankshaft Main Bearing Journal Out of Roundness		
mm		in
0.050	MAX	0.002

Crankshaft Main Bearing Journal Taper		
mm		in
0.013	MAX	0.0005

Note : If the crankshaft main bearing journals are **not** within the given specifications, the crankshaft **must** be reground. Always grind all of the journals when one is **not** within specifications. Oversize connecting rod bearings are available; see the appropriate parts catalog.

Measure the thrust face width. Minor scratches are acceptable. Polish the machined surfaces. Use a fine crocus cloth.

Crankshaft Thrust Face Width (Standard)		
mm		in
42.98	MIN	1.692
43.08	MAX	1.696

Note : Oversize thrust bearings are available if the thrust distance is **not** within specifications. See the appropriate parts catalog.

Measure the rear oil seal flange outside diameter.

Crankshaft Rear Oil Seal Flange Outside Diameter		
mm		in
129.98	MIN	5.117
130.03	MAX	5.119

Measure the damper pilot outside diameter.

Crankshaft Damper Pilot Outside Diameter		
mm		in
23.92	MIN	0.942
24.00	MAX	0.945

Measure the crankshaft gear journal outside diameter.

Crankshaft Gear Journal Outside Diameter		
mm		in
75.987	MIN	2.9916
76.006	MAX	2.9924

Note : If the crankshaft is **not** going to be used immediately, protect the part with a plastic cover to prevent dirt from sticking to the oil.

Lubricate the crankshaft to prevent rust. Use a light preservative oil.

Install

⚠ CAUTION ⚠

The tang (1) on the bearing shell must be in the slot (2) of the bearing saddle to correctly position the bearing and prevent engine damage.

Upper Main Bearings

Do **not** lubricate the side of the main bearing against the cylinder block.

Apply a coat of assembly lubricant, Part Number 3163087, or equivalent, to the crankshaft side of the upper main bearings.

Note : Make sure the main bearing being installed is the same size as the main bearing that was removed. The size is engraved on the back of the main bearing.

Note : The crankshaft thrust bearing **must** be installed in the number four position.

AYBOLU ISUZU PARTS SALES

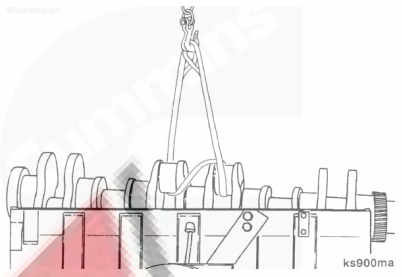
Note : The upper and lower main bearing shells of some engines are **not** interchangeable. The backs of the main bearings are marked with the proper orientation, if required.

Note : If used bearing shells are to be installed, they **must** be installed in their original locations, as marked during disassembly.

Use a hoist and nylon list sling, Part Number 2892501.

Install the sling around the number 3 and number 4 connecting rod bearing journals.

Install the crankshaft.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the main bearing caps. Refer to Procedure 001-006 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-006.html)
- Install the connecting rod caps. Refer to Procedure 001-005 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-005.html)
- Install the rear crankshaft seal carrier. Refer to Procedure 001-067 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-067.html)
- Install the front gear housing. Refer to Procedure 001-033 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-033.html)
- Install the camshaft gear. Refer to Procedure 001-012 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-012.html)
- Install the fuel pump. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)
- Install the air compressor, if required. Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)
- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)

- Install the flywheel housing. Refer to Procedure 016-006 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-006.html)
- Install the flexplate, if removed. Refer to Procedure 016-004 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-004.html)
- Install the flywheel, if removed. Refer to Procedure 016-005 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-005.html)
- Install the front cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Install the rubber vibration damper, if removed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Install the viscous vibration damper, if removed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Check the engine rotation. See the Rotation Check section of this procedure.
- Install the engine. Refer to Procedure 000-002 in Section 0. (/qs3/pubsys2/xml/en/procedures/425/425-000-002.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Rotation Check

With the engine fully assembled, check to make sure the engine rotates freely. Use barring tool, Part Number 3824591, or equivalent.

Insert the barring tool into the flywheel housing. Engage the flywheel/flexplate ring gear. The crankshaft can then be rotated by hand, using a 1/2 inch ratchet or breaker bar.

If the engine does **not** rotate freely, check for any external obstructions (flywheel/flexplate, engine-driven accessories, etc.). If no obstructions are found, remove the oil pan and look for internal damage.

ANADOLU ISUZU AFTERSALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- 240 grit abrasive cloth

Preparatory Steps

⚠ WARNING ⚠

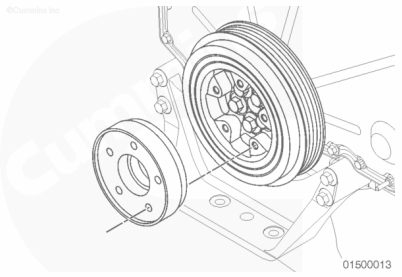
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the fan and fan shroud assembly, if necessary. Refer to Procedure 008-038 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-038.html)
- Remove the fan belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the crankshaft pulley. Refer to Procedure 001-022 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-022.html)

Remove

Remove the capscrews.

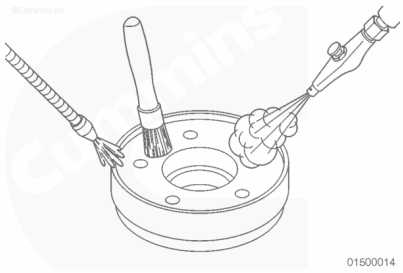
Remove the crankshaft adapter.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

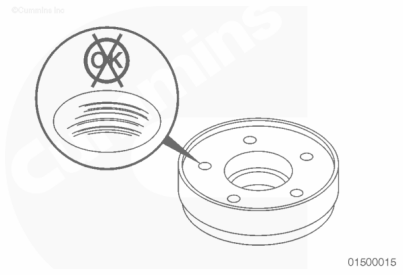
⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause personal injury.

Clean the part. Use solvent or steam. Dry with compressed air.

⚠ CAUTION ⚠

The mounting pilots and surfaces control the center and spacing of the vibration damper and the pulleys. Do not repair the part by machining. It will cause an out-of-balance condition or a crankshaft failure.



Check all mounting pilots and surfaces for damage from fretting.

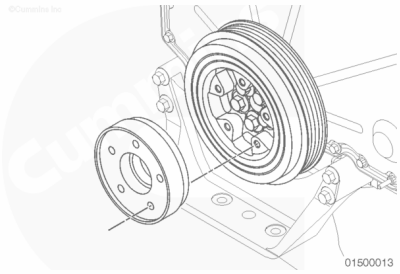
If it is **not** possible to remove the damage with a 240 grit abrasive cloth, the part **must** be replaced.

Install

Use clean engine oil to lubricate the capscrew threads.

Install the capscrews.

Tighten the capscrews in a star pattern.



Torque Value:
M14 Capscrews 180 n•m [133 ft-lb]

Torque Value:
M12 Capscrews 77 n•m [57 ft-lb]

Torque Value:
M10 Capscrews 65 n•m [48 ft-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the crankshaft pulley. Refer to Procedure 001-022 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-022.html)
- Install and adjust the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Install the fan and fan shroud assembly. Refer to Procedure 008-038 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-038.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for proper operation.

- Soft hammer

Preparatory Steps

⚠ WARNING ⚠

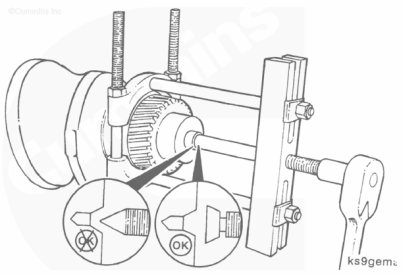
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the crankshaft. Refer to Procedure 001-016 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-016.html)

Remove

⚠ CAUTION ⚠

Do not try to split the front crankshaft gear to remove. The gear is made out of steel and will not split. Damage to the tool and the crankshaft can result.



Note : If a front crankshaft seal wear sleeve has been installed during a previous repair, it **must** be removed before the crankshaft gear is removed. Refer to Procedure 001-025 in Section 1.

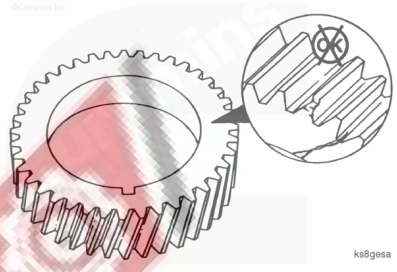
(/qs3/pubsys2/xml/en/procedures/425/425-001-025.html)

Use heavy-duty bearing separator, Part Number 316427, or gear puller, as illustrated, to remove the crankshaft gear.

Clean and Inspect for Reuse

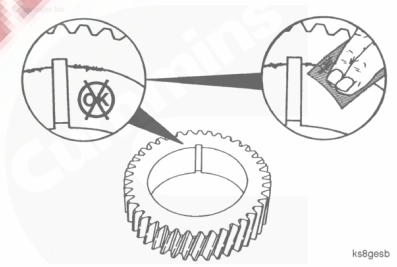
Inspect for cracks, broken, or chipped teeth.

The gear **must** be replaced if it is damaged.



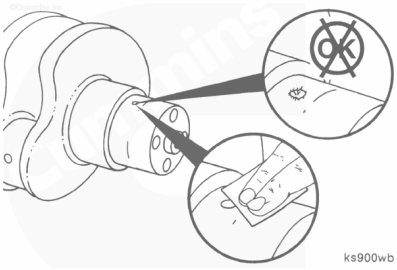
Inspect the gear and keyway for nicks or burrs.

Remove nicks and burrs. Use a fine crocus cloth.



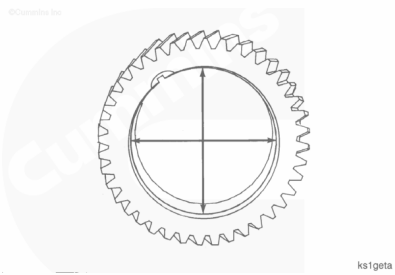
Inspect the crankshaft gear journal and gear alignment dowel pin hole for burrs or damage.

Remove burrs. Use a fine crocus cloth.



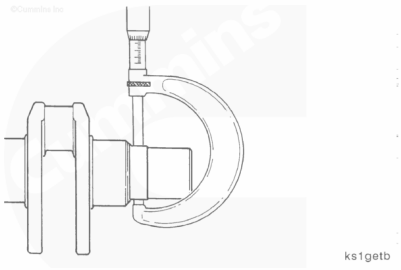
Measure the crankshaft gear bore inside diameter.

Crankshaft Gear Bore Inside Diameter		
mm		in
75.898	MIN	2.9881
75.923	MAX	2.9891



ANADOLU ISUZU PARTS SALES

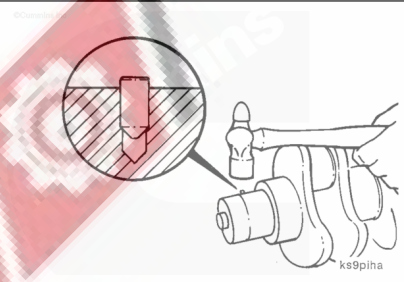
Measure the crankshaft gear journal outside diameter. Refer to Procedure 001-016 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-016.html)



Install

⚠ CAUTION ⚠

Do not exceed the specified heating time or temperature. The crankshaft teeth can be damaged.



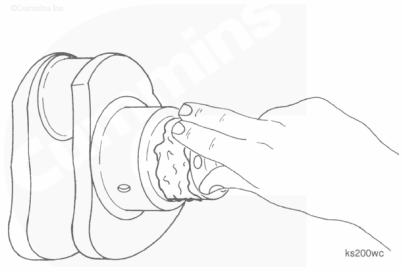
Install the gear alignment dowel into the crankshaft. Use a soft hammer.

The pin **must** be 1.02 mm [0.040 in] above the crankshaft surface.

Heat the gear in an oven for a minimum of 45 minutes, but **not** more than 2 hours.

Measurements			
		celsius	fahrenheit
Temperature	Steel Gear	177	350

Lubricate the outside diameter of the crankshaft gear journal. Use assembly lubricant, Part Number 3163087, or equivalent.



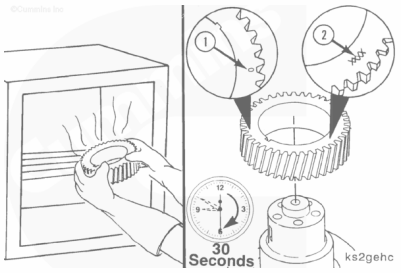
⚠ WARNING ⚠

To reduce the possibility of personal injury, wear protective gloves when handling parts that have been heated.

ANADOLU ISUZU PARTS SALES

⚠ CAUTION ⚠

The timing mark (1) and part number (2) on the gear must be facing away from the crankshaft after the gear is installed. Engine damage can result if the gear is installed backwards.



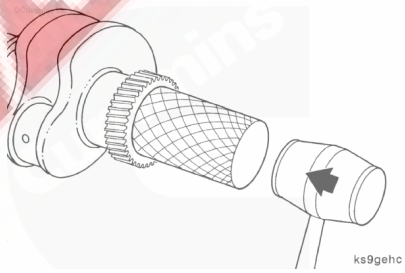
⚠ CAUTION ⚠

Do not use water or oil to reduce the cooling time. The gear can crack. Allow the gear to air cool.

Remove the gear from the oven.

Align the keyway of the gear with the alignment dowel pin in the crankshaft. Install the gear within 30 seconds.

If the gear cools and stops on the crankshaft before it is fully installed, use a driver to complete the installation.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the crankshaft. Refer to Procedure 001-016 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-016.html)
- Connect the batteries. See equipment manufacturer service information.

Recommended Cummins® Service Tools

- Seal installer, Part Number 3824499

Additional Service Items

- Sealant

Preparatory Steps

⚠ WARNING ⚠

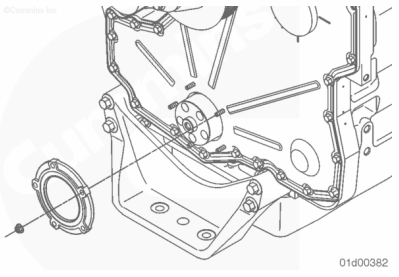
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)

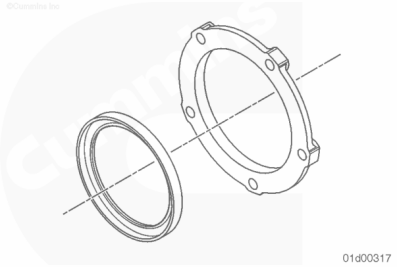
Remove

Remove the dust shield, if installed. Inspect for reuse.

Remove the front crankshaft seal carrier.



Remove the oil seal from the carrier. Drive the oil seal from the back side of the carrier toward the front side of the carrier, while supporting the carrier.



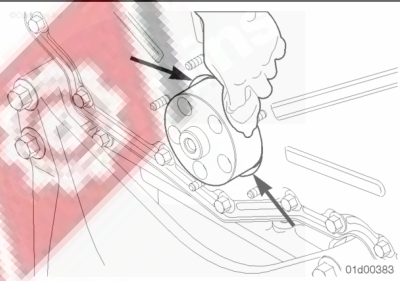
Clean and Inspect for Reuse

Clean the front gear cover seal bore and the crankshaft surface of all oil and seal residue.

Clean the residual sealant from the front gear cover and oil seal carrier surface.

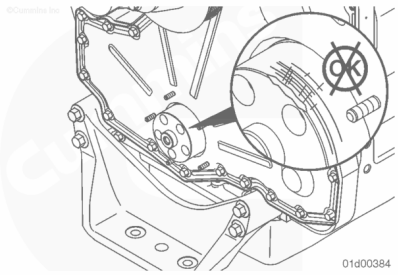
Clean front gear cover surface that contacts the oil seal carrier with isopropyl alcohol, parts cleaner, or contact cleaner.

Clean the oil seal carrier surface with isopropyl alcohol, parts cleaner, or contact cleaner.



Inspect the crankshaft for excessive wear.

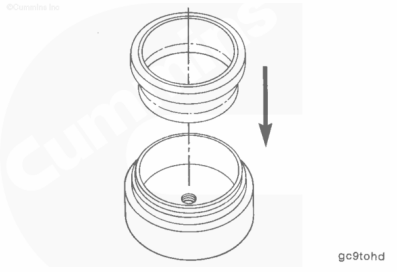
Note : If the crankshaft has excessive wear, a service wear sleeve is available. Refer to Procedure 001-025 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-025.html)



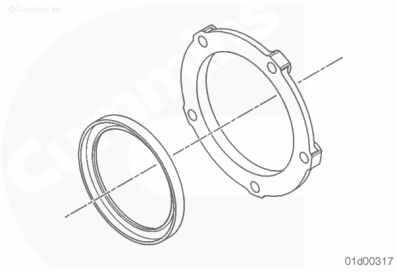
Install

Leave the plastic pilot installation tool in the lubricating oil seal.

Position the seal on Seal installer, Part Number 3824499, with the lubricating oil seal dust lip facing outward.



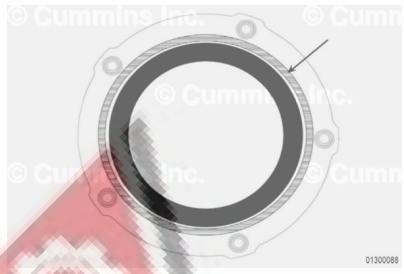
Note : Properly support the carrier lubricating oil seal flange to prevent damage to the lubricating oil seal and carrier.



Press the lubricating oil seal into the carrier from the back side of the carrier toward the front side of the carrier.

Press the lubricating oil seal until the seal is flush on front of the carrier.

Apply a continuous bead of sealant, approximately 4 mm [0.16 in] thick and 4 mm [0.16 in] wide, around the inside of the seal carrier, between the mounting holes and the seal.



Sealant bead should lie within the gray hatch zone as indicated by the arrow in the figure. It should **not** fall on the inside edge by the lubricating oil seal nor should it fall inside the mounting holes.

Apply a bead of sealant, approximately 4 mm [0.16 in] thick and 4 mm [0.16 in] wide, around all stud seams on the front gear cover.

Install the seal carrier on the front gear cover within 10 minutes of applying sealant.

Remove the plastic installation tool.

Starting with the upper left stud, tighten the carrier mounting nuts in a star pattern (as shown in the graphic).

Torque Value: 8 n•m [71 in-lb]

Install the dust shield 1 mm [0.04 in] away from the lubricating oil seal face.

Recommended Cummins® Service Tools

- Rear Crankshaft Seal Replacer Kit, Part Number 3164660, for unitized rear crankshaft seals **only**
- Rear Crankshaft Seal Installation Kit, Part Number 5395259, for rear crankshaft lip seals **only**
- Rear Crankshaft Seal Removal Kit, Part Number 5395330, for rear crankshaft lip seals **only**
- Rear crankshaft seal carrier centering guide, Part Number 5395409, for front gear train engines **only**
- P-80 lubricant, Part Number 3824878, or mild soapy water

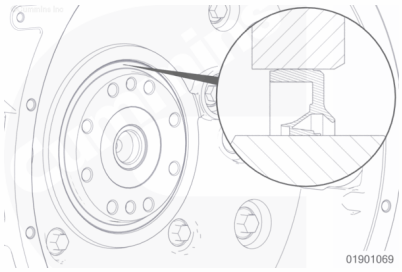
Additional Service Items

- Safety solvent
- Anti-seize compound or a suitable grease

General Information

Lip Seal

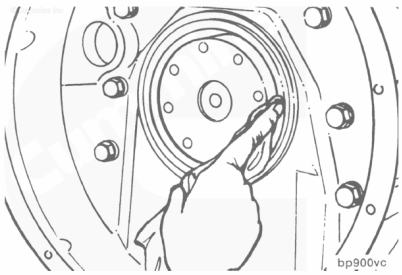
Engines covered by this procedure use a lip style rear crankshaft seal (shown). The rotating portion of the sealing occurs at the contact surface between the lip of the seal and the crankshaft. The seal is installed into the flywheel housing/seal carrier bore using required service tools, Rear Crankshaft Seal Installation Kit, Part Number 5395259, and Rear Crankshaft Seal Removal Kit, Part Number 5395330.



Some rust prevention oils applied at the factory have fluorescent tracer dyes added to them and can provide false test results when checking for external oil leaks using a black light.

Clean the area around the rear seal with solvent.

Check the area with a black light to insure there is **not** already fluorescent dye present before adding tracer dye to the lubricating oil.



BURDOLU ISUZU PARTS SALES

Unitized Seal

Some engines used to use a unitized seal, which has a metal inner diameter that allows the inner and outer diameter of the seal to press-fit onto the crankshaft and the flywheel housing respectively, requiring service tool, Part Number 3164660, to remove.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.

Note : Use a container that can hold at least 26 liters [27 qt] of lubricating oil.

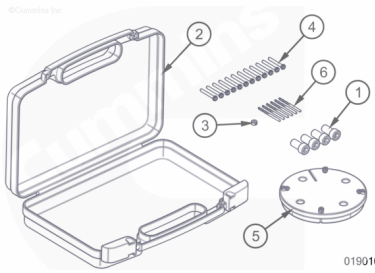
- Disconnect the batteries. See equipment manufacturer service information.
- If equipped with a wet flywheel housing, drain the oil from the flywheel housing by removing the plug in the bottom of the flywheel housing.
- Remove the transmission and all related components, if equipped. See equipment manufacturer service information.
- Remove the flywheel, if installed. Reference Procedure 016-005 in Section 16.
- Remove the flexplate, if installed. Reference Procedure 016-004 in Section 16.

Remove

Lip Seal

⚠ CAUTION ⚠

This procedure must not be used on engines with a unitized seal.



Note : Lip style rear crankshaft seals are **only** to be removed using Rear Crankshaft Seal Removal Kit, Part Number 5395330.

Table 1, Rear Crankshaft Seal Removal Kit, Part Number 5395330

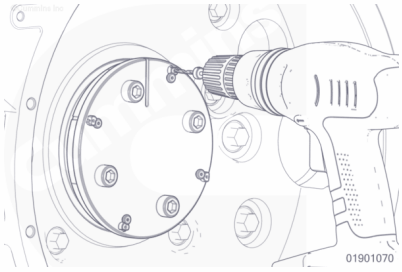
Item Number	Part Number	Description	Quantity
1	3164174	Screw, Socket Head Cap	4
2	3165143	Case, Storage	1
3	5395324	Collar, Stop	1
4	5395325	Screw, Self Tapping Metal	12
5	5395329	Remover, Crankshaft Seal	1
6	5395410	Bit, Drill	6

Use the groove on the face of the rear crankshaft seal remover to set the depth on the drill bit stop collar.

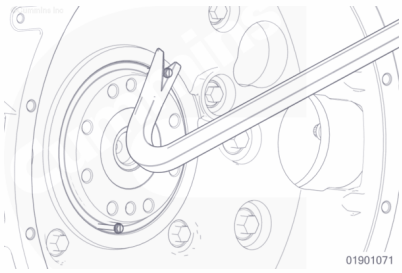
Install the crankshaft seal remover toward the end of the crankshaft with socket head capscrews.

Use the stop collar and drill bushings to drill two holes 180 degrees apart.

Remove the crankshaft seal remover from the crankshaft.



Use a driver to install the self tapping metal screw into the drilled holes. Use a forked prybar to pull the rear crankshaft seal out.

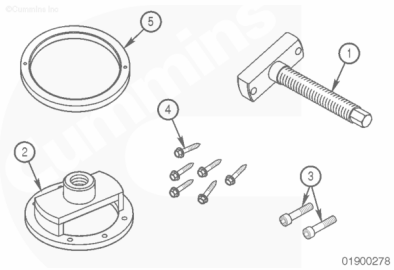


Unitized Seal

For engines with unitized seals, use service tool Part Number 3164660.

Table 2. Rear Crankshaft Seal Replacer Kit, Part Number 3164660

Item Number	Part Number	Description	Quantity
1	3164666	Replacer screw assembly	1
2	3164664	Crankshaft seal replacer	1
3	3164174	Socket head capscrew, M12 x 1.25x 25 mm	2
4	3164217	Sheet metal screw, Number 10x25.4 mm [1 in] long	25 (7 shown)
5	-	Disposable plastic driver (purchased with rear crankshaft seal kit)	1



With the rear crankshaft seal installed onto the crankshaft flange as described earlier in this procedure, mount the replacer screw assembly (1) onto the rear of the crankshaft.

Install the two M12 x 1.25 x 60-mm socket head capscrews (3).

⚠ CAUTION ⚠

Do not use an impact wrench or air tools. Doing so can damage the tool.

Lubricate the replacer screw with anti-seize compound or a suitable grease.

Hold the replacer screw and install the crankshaft seal replacer (2) onto the replacer screw assembly. Advance the crankshaft seal replacer toward the seal by rotating it

clockwise until the attached disposable driver is positioned against the rear crankshaft seal. Then insert small screws into the crankshaft seal replacer tool.

⚠ CAUTION ⚠

Do not overtighten the replacer screw assembly after the crankshaft seal replacer contacts the flywheel housing. Doing so can damage the tool.

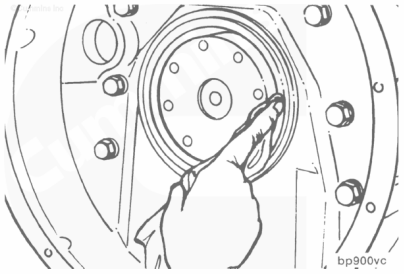
While holding the crankshaft seal replacer, rotate the replacer screw **counterclockwise** until the disposable driver attached to the crankshaft seal replacer makes contact with the flywheel housing.

Remove the service tools.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Compressed air used for cleaning should not exceed 207 kPa [30 psi]. Use only with protective clothing, goggles/shield, and gloves to reduce the possibility of personal injury.

⚠ CAUTION ⚠

The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

Clean the rear crankshaft sealing surface and bore with solvent.

Dry the surface with compressed air.

Note : If the crankshaft has excessive wear, a service wear sleeve is available.

Inspect the crankshaft seal contact area for a wear groove. If the groove is deeper than 0.25 mm [0.010 in], a wear sleeve and oversize seal **must** be used. Reference Procedure 001-067 in Section 1.

Install

Note : For engines using a lip seal rear crankshaft seal, the use of Rear Crankshaft Seal Installation Kit, Part Number 5395259, is required.

Table 3, Rear Crankshaft Seal Installation Kit, Part Number 5395259

Item Number	Part Number	Description	Quantity
1	3163741	Nut, Regular Hexagon	4
2	5395257	Pin, Guide	4
3	5395258	Installer, Crankshaft Seal	1

⚠ CAUTION ⚠

The seal lip/bore and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

To aid in installation, apply a mild soap (recommended 50/50 water to soap volumetric ratio) or P-80, Part Number 3824878, to the outside diameter of the seal case (A)

Note : A seal pilot (B) is provided with the new seal. The seal **must** be left on the seal pilot while installing the seal onto the nose of the crankshaft. This will make sure the lips of the seal do **not** get damaged during installation.

Place the new rear crankshaft seal, with tapered end of the seal pilot, over the crankshaft nose and slide it by hand toward the flywheel housing.

Note : Make sure the seal is positioned square with the crankshaft.

Remove the seal pilot.

Note : For rear gear train engines, the rear crankshaft seals for the wet flywheel housing applications do **not** come with a disposable seal driver. Service tool, Part Number 3824078, **must** be used to install the rear crankshaft seal for the wet flywheel housing. This is the same service tool used for installing the rear crankshaft seal and wear sleeve assembly. Reference Procedure 001-067 in Section 1.

Table 4: Rear Crankshaft Seal Installation Kit, Part Number 3824078

Item Number	Part Number	Description
1	3163734	Plate
2	3163628	Stud
3	3163741	Hex Nut

Install the rear crankshaft seal using Rear Crankshaft Seal Installation Kit, Part Number 5395259.

Install guide pins toward the end of the crankshaft with the slotted side facing away from the engine.

Note : On C Series and L Series engines **only**, if the seal carrier is removed for any repair purposes, use centering guide service tool, Part Number 5395409, to align the seal carrier to the cylinder block with reference to the centerline of the crankshaft. Reference Procedure 001-104 in Section 1.

Slide the crankshaft seal installer over the guide pins until it is touching the rear crankshaft seal.

Install the hex nuts onto the guide pins until the hex nuts bottom out on the crankshaft seal installer.

Use a deep well socket and tighten the hex nuts in a crisscross pattern until the crankshaft seal installer bottoms out on the crankshaft. Tighten all four nuts to the specification below to verify the crankshaft seal installer bottoms out with the crankshaft.

Torque Value: 10 to 12 n•m [89 to 106 in-lb]

Note : The rear crankshaft seal installs deeper using the Crankshaft Seal Installation Kit compared to disposable service kits.

Finishing Steps

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have ssistance or use appropriate lifting equipment to lift this component or assembly.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the flywheel, if removed. Reference Procedure 016-005 in Section 16.
- Install the flexplate, if removed. Reference Procedure 016-004 in Section 16.
- Install the transmission and all related components, if equipped. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Start and operate the engine. Check for leaks.

ANADOLU ISUZU

Last Modified: 27-Aug-2018

Select Service Tools

Recommended Cummins® Service Tools

- Weat Sleeve Installation Kit, Part Number 3165112, or equivalent

Additional Service Items

- Hammer
- Chisel
- Crocus cloth

Preparatory Steps

⚠ WARNING ⚠

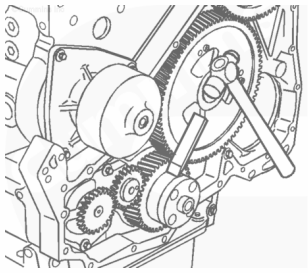
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) cable first and attach the negative (-) cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the front crankshaft seal. Refer to Procedure 001-023 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-023.html)
- Remove the front cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)

Remove

⚠ CAUTION ⚠

Do not nick or gouge the crankshaft with the chisel. If the crankshaft is severely damaged, it must be replaced.

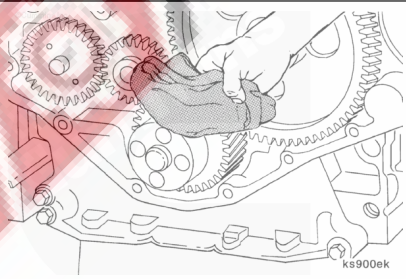


Use a hammer and a chisel **only** as wide as the wear sleeve. Make one or two chisel marks across the wear sleeve. This will expand the wear sleeve allowing the sleeve to be removed.

Clean and Inspect for Reuse

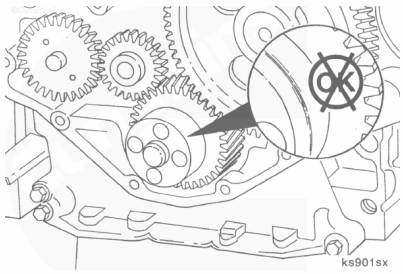
Remove any rust or other deposits from the crankshaft flange. Use a crocus cloth.

Clean the crankshaft flange. Use a clean cloth.



Inspect the seal contact area of the crankshaft for a wear groove. If the seal has worn a groove deep enough to be felt with a sharp object or fingernail, it will be necessary to install a wear sleeve to prevent an oil leak.

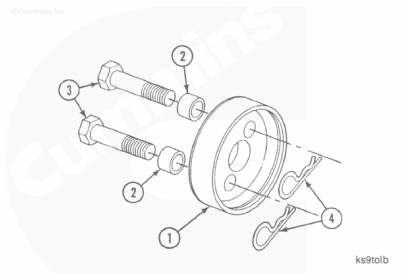
The oil seal used with the wear sleeve has a larger inside diameter than the standard seal. The two seals are **not** interchangeable. See the appropriate parts catalog for the correct part number.



Install

Note : Engines with four capscrew holes on the front of the crankshaft use two capscrews with the sleeve installation kit, engines with five capscrew holes on the front of the crankshaft use three capscrews with the sleeve installation kit.

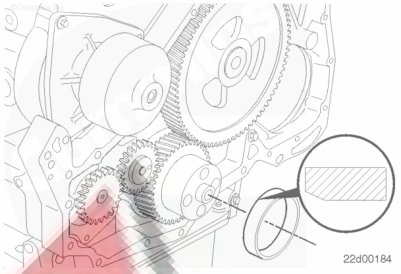
Install the wear sleeve to the correct position on the crankshaft. Use Wear Sleeve Installation Kit, Part Number 3165112, or equivalent. The kit consists of the following:



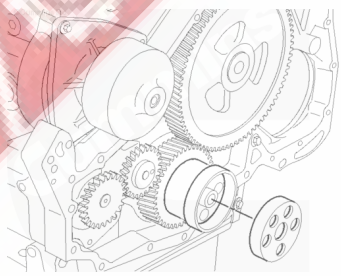
Reference Number	Description	Quantity
1	Driver	1
2	Spacer	3
3	Capscrew M14 x 1.5 x 60 mm	3

Apply a thin coat of clean engine lubricating oil to the crankshaft flange.

Position the chamfered end of the wear sleeve onto the end of the crankshaft.

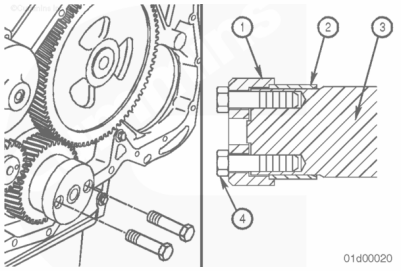


Position the counterbore end of the driver onto the wear sleeve.



Install the capscrews (without spacers) through the driver and into the crankshaft capscrew holes. Align the wear sleeve and driver perpendicular with the crankshaft. Tighten the capscrews finger-tight.

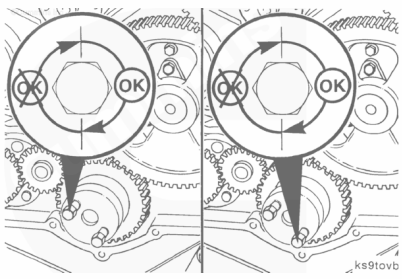
1. Driver
2. Wear Sleeve
3. Crankshaft
4. Capscrew.



Note : To prevent damage to the wear sleeve, do **not** exceed ½ revolution of each capscrew.

Alternately tighten the capscrews until the sleeve is installed to a depth of approximately 16 mm [0.625 in].

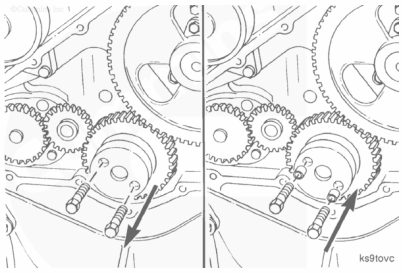
Torque Value: 20 n•m [177 in-lb]



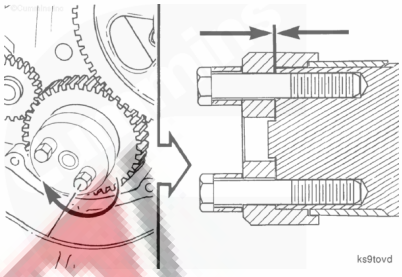
Remove the capscrews. Iinstall the spacer on each capscrew.

Install the capscrews again.

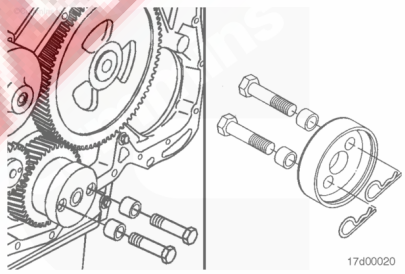
ANADOLU ISUZU AFTER SALES



Continue to alternately tighten the capscrews until the bottom of the driver contacts the end of the crankshaft.



Remove the driver.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) cable first and attach the negative (-) cable last.

- Install the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Install the front crankshaft seal. Refer to Procedure 001-023 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-023.html)
- Install the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Install the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Connect the batteries. See equipment manufacturer service information.

ANADOLU ISUZU AFTER SALES

- Operate the engine. Check for leaks.

Last Modified: 14-Sep-2016

Select Service Tools

Recommended Cummins® Service Tools

- Crack Detection Kit, Part Number 3375432
- Thread Repair Kit, Part Number 3377905 (standard)
- Thread Repair Kit, Part Number 3377903 (metric)
- Counterbore ledge cutter drive unit, Part Number 3163785.

Additional Service Items

- Non-metallic brush.

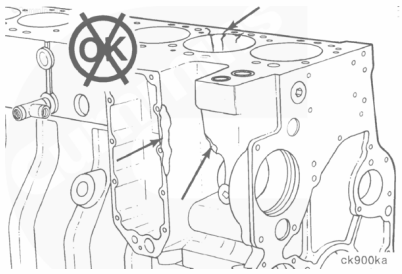
Preparatory Steps

Note : The block has clearance scallops added to accommodate the connecting rod design. Previous product blocks do **not** have the clearance feature. When replacing parts, see the parts list to order the correct parts.

- Remove the engine and place it on an engine stand. Refer to Procedure 000-001 in Section 0. (/qs3/pubsys2/xml/en/procedures/425/425-000-001.html)
- Disassemble the engine. See Section DS - Engine Disassembly.

Initial Check

Before cleaning or further disassembly of the block, perform an inspection to see if there is any damage (cracks, fretting, etc.) that would prohibit reuse. Give special attention to areas of the block that include:



- Main bearing caps and bores
- Camshaft bores
- Cylinder bores
- Tappet bores
- Cylinder block combustion deck
- Oil pan mounting surface
- Lubricating oil pump mounting area
- Water pump mounting area
- Front and rear of block sealing surfaces

- Lubricating oil cooler cavity.

Clean and Inspect for Reuse

Inspect all pipe plugs, expansion plugs, and straight thread plugs for signs of damage or leaks.

If it is necessary to thoroughly clean the cylinder block for reuse, remove all pipe plugs, expansion plugs, and straight thread plugs, as necessary. This will make sure all oil and coolant passages can be cleaned out.

Refer to Procedure 017-002 in Section 17. (/qs3/pubsys2/xml/en/procedures/425/425-017-002.html)

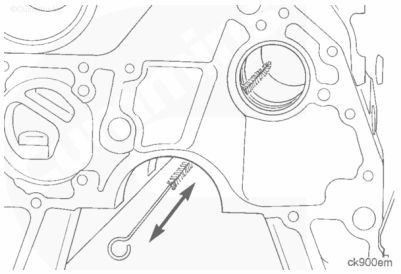
Refer to Procedure 017-007 in Section 17. (/qs3/pubsys2/xml/en/procedures/99/99-017-007.html)

Refer to Procedure 017-011 in Section 17. (/qs3/pubsys2/xml/en/procedures/100/100-017-011.html)

Refer to Procedure 017-015 in Section 17. (/qs3/pubsys2/xml/en/procedures/425/425-017-015.html)

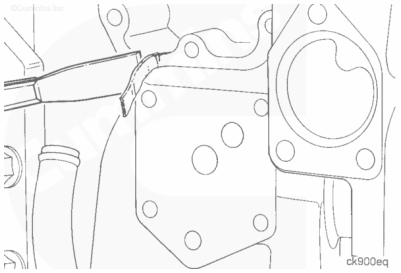
⚠ WARNING ⚠

When using solvents, acids or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



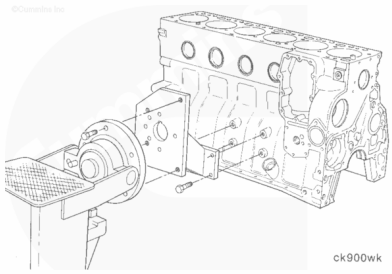
Clean the block oil drillings. Use clean solvent and a non-metallic brush.

Thoroughly clean all gasket sealing surfaces of any remaining gasket residue.



⚠ WARNING ⚠

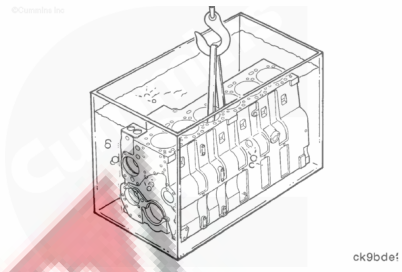
This component or assembly weighs greater than 23 kg [50 lb]. To prevent personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



Remove the block from the engine stand.

⚠ CAUTION ⚠

If the camshaft bushings have not been removed, make sure to use a cleaning solution that will not damage the camshaft bushing(s).



Follow manufacturer operating instructions for the cleaning tank.

Follow solvent manufacturer instructions for using solvent.

Note : Cummins Inc. does **not** recommend any specific cleaning solution. Experience has shown the best results are obtained by the use of a cleaning solution that can be heated from 80 to 95°C [176 to 203°F] and a cleaning tank that will mix and filter the cleaning solution.

Clean the cylinder block in the cleaning tank.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

To reduce the possibility of engine damage, make sure all debris is removed from the capscrew holes and oil passages.

Remove the block from the cleaning tank.

Clean the block thoroughly. Use steam.

Use compressed air to dry the block.

With the cylinder block cleaned, inspect the cylinder block for signs of cracks, fretting, and discoloration that would prohibit reuse.

To help identify cracks in the cylinder block, use Crack Detection Kit, Part Number 3375432.

Give special attention to areas of the block that include:

- Main bearing caps and bores
- Camshaft bores
- Cylinder bores
- Tappet bores
- Cylinder block combustion deck
- Oil pan mounting surface
- Lubricating oil pump mounting area
- Water pump mounting area
- Front and rear of block sealing surfaces
- Lubricating oil cooler cavity.

Make sure to inspect the main bearing caps and main bearing saddle areas for cracks, fretting and signs of discoloration.

If any cracks are found, the block **must** be replaced.

Inspect all threaded capscrew holes for damaged threads. Coiled thread inserts can be used to repair any damaged threads.

Cummins® service tool thread repair kits are available:

1. Part Number 3377905, for standard threads.
2. Part Number 3377903, for metric threads.

Note : Coiled thread inserts should **not** be used to repair main bearing saddle threaded capscrew holes. If damaged, the block **must** be replaced.

Inspect the camshaft bores for scoring, scuffing, or excessive wear.

If the camshaft bore is damaged, the cylinder block **must** be replaced. Oversize cam bushings are **not** available.

Inspect the cylinder block counterbore for cracks, fretting, or pitting.

- Cracks (1) in the cylinder block counterbore are **not** acceptable and are **not** able to be machined. If cracks in the counterbore are observed, the cylinder block **must** be replaced.
- Fretting (2) on the cylinder block counterbore is **not** acceptable. Fretted cylinder block counterbores **must** be machined if possible and shims **must** be installed for the correct cylinder liner protrusion. Reference the repair section of this procedure.

Pitting on the cylinder block counterbore is acceptable if:

- Pitting (3, 4) is more than ¼ of the cylinder block counterbore width away from the inner edge of the cylinder block counterbore
- The pitted area (5, 6, 7) covers less than 20 percent of the total area of the cylinder block counterbore
- Correct cylinder liner protrusion can be obtained.

If pitting is observed which does **not** meet the above criteria, the cylinder block counterbore **must** be machined until the above criteria is met and a shim installed to maintain cylinder liner protrusion. Reference the repair section of this procedure. If the criteria are **not** able to be met with the available shims the cylinder block **must** be replaced.

Measure

All measurements of the cylinder block **must** be made when the cylinder block is positioned on a flat surface with the main bearing caps installed.

If the cylinder block is mounted on the engine stand and/or the main bearing caps are **not** installed, the measurements can be incorrect because of distortion to the cylinder bores, main bearing bores, camshaft bores, etc.

Inspect the cylinder block head deck for damage.

Check the cylinder block head deck for flatness between each cylinder.

Cylinder Block Flatness Specification		
mm		**in**
0.075	End-to-end	0.003
0.075	Side-to-side	0.003

Inspect for any localized dips or imperfections. If any damage is detected, or the flatness is out of specification, the cylinder block **must** be replaced.

Measure the cylinder liner bore in the block.

Cylinder Liner Bore in Block (Press Fit Bore)		
mm		in
130.900	MIN	5.1535
130.950	MAX	5.1555

Note : If any of the cylinder liner bores are out of specification, the cylinder block **must** be replaced.

Measure the liner counterbore depth.

Cylinder Block Counterbore Depth from Cylinder Block Head Deck		
mm		in
122.930	MIN	4.8397
123.000	MAX	4.8425

Note : If any of the liner counterbore depths are out of specification, the counterbore can be machined and shims installed. See the Repair section of this procedure.

Measure the camshaft bores without the camshaft bushing installed.

Camshaft Bore Diameter (Without Bushing)		
mm		in
64.01	MAX	2.520

Note : If any of the camshaft bore diameters are out of specification, the cylinder block **must** be replaced.

Inspect the tappet bores for scoring or excessive wear.

Measure the tappet bores.

Tappet Bore Diameter		
mm		in
31.295	MIN	1.2321
31.325	MAX	1.2333

Note : If any of the tappet bores are out of specification, the cylinder block **must** be replaced.

Install the main bearing caps without the main bearings. Refer to Procedure 001-006 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-006.html)

Tighten the main bearing cap capscrews.

Torque Value: 176 n•m [130 ft-lb]

Measure the main bearing bore with the bearings removed.

Main Bearing Bore Diameter		
mm		in
104.982	MIN	4.1331
105.018	MAX	4.1346

Note : The maximum bore misalignment is 0.0127 mm [0.005 in].

Repair

If the counterbores require machining, use counterbore ledge cutter drive unit, Part Number 3163785, to machine the counterbore to the proper depth.

Do **not** machine counterbore ledge to a depth greater than the thickest available shim. Refer to Procedure 001-058 in section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-058.html)

Cylinder liner shims are available in the following thicknesses.

Use **only** one shim per cylinder.

Cylinder Liner Shim Thickness	
mm	**in**
0.25	0.010
0.38	0.015
0.51	0.020
0.76	0.030
1.00	0.040

If the cylinder block is **not** to be used right away, coat all machined surfaces with a rust preventative solvent.

Make sure to cover the cylinder block to prevent dust and debris from collecting on and in the cylinder block.

New Cylinder Block

If replacing the cylinder block or using a previously stored cylinder block, make sure to clean any oil/rust preventative solvent from the cylinder bores, gasket sealing areas, and main bearing bores prior to use.

Finishing Steps

- Assemble the engine. See Section AS - Engine Assembly.
- Remove the engine from the engine stand and install the engine. Refer to Procedure 000-002 in Section 0. (/qs3/pubsys2/xml/en/procedures/425/425-000-002.html)

ANADOLU ISUZU AFTER SALES

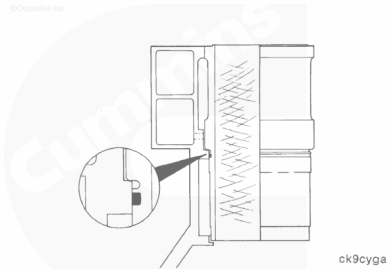
Additional Service Items

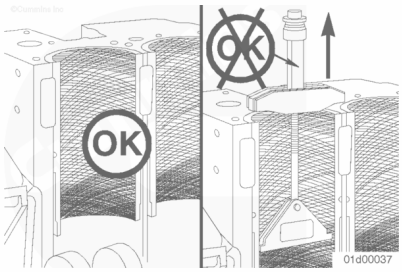
- Gasket scraper
- Feeler gauge

General Information

The cylinder block has a replaceable cylinder liner. A mid-stop design is used to locate the liner in the block. A press fit between the liner and block provides coolant sealing at the top of the liner. A rectangular ring seal (liner seal) is used for sealing at the mid-stop portion of the liner.



Note : Cummins Inc. does **not** recommend removing the cylinder liners to repair an oil consumption problem if the inside diameters of the liners are within the inspection limits included in this procedure. Careful analysis of the condition of the liner bores, piston rings, and pistons can result in the restoration of cylinder sealing with a minimum replacement of parts.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

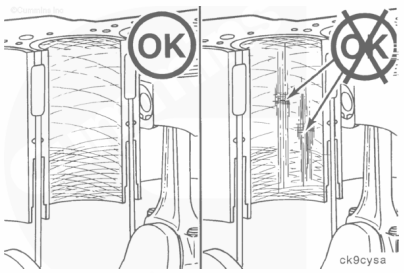
⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Remove the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Remove the piston and connecting rod assemblies. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)

Initial Check

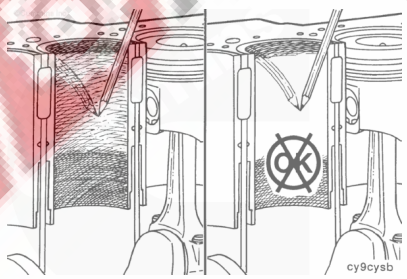
Note : Before removing the cylinder liners, inspect the condition to determine reuse.



Inspect the inside diameters of the liners for cracks, scuffing, and scoring.

Inspect the inside diameters for vertical scratches deep enough to be felt with a fingernail.

Note : If a fingernail catches in the scratch, the liner **must** be replaced.

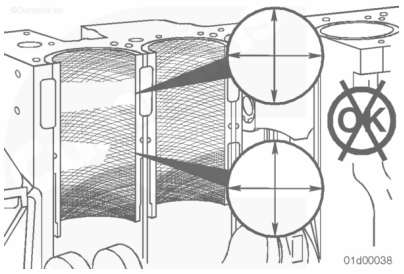


Inspect the inside diameter for liner bore polishing.

A moderate polish produces a bright mirror finish in the worn area with traces of the original hone marks or an indication of an etch pattern.

A heavy polish produces a bright mirror finish in the worn area with no traces of hone marks or an etch pattern.

Do **not** reuse liners exhibiting heavy polish or any indications of particle embedment from a malfunction. Severely worn liners will have a ridge near the top of the liner bore.

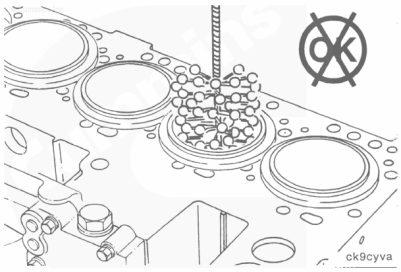


If the wear pattern indicates the liner bore is **not** straight or **not** round, use a dial bore gauge to measure the liner inside diameter in four places 90 degrees apart at the top and bottom of the piston travel area.

Cylinder Liner Dimensions				
	mm		in	
Taper		0.04	MAX	0.0016
Out Of Round		0.04	MAX	0.0016
Bore Diameter		114.04	MAX	4.4898

Note : If a liner bore is **not** acceptable for reuse, it **must** be replaced. Damaged liners can **not** be honed or deglazed. This would destroy the cross-hatch pattern needed for oil control.

Note : Do **not** remove or disturb the liner seals for liners which pass the inspection criteria.



Liner protrusion is the distance the liner protrudes above the block face. Before removing the liners, check the protrusion in the "unclamped" state at four places 90 degrees apart. Use liner protrusion gauge, Part Number 3164438, to measure the liner protrusion.

Cylinder Liner Protrusion		
mm		in
0.026	MIN	0.0010
0.122	MAX	0.0048

The maximum allowable difference between adjacent cylinders is 0.051mm [0.002 in].

If the liner was installed correctly and the liner protrusion is out of limits, it will be necessary to machine the counterbore and add shims to restore to the original specifications.

Remove

Use clean shop rags to cover the crankshaft to prevent debris from falling into the main journal area or into the connecting rod journal oil drilling.

⚠ CAUTION ⚠

The liner puller must be installed and used as described to avoid damage to the cylinder block. The puller must not contact the block casting at points (1), (2), (3), and (4).

Universal Cylinder Liner Puller Method

Cylinder liner puller, Part Number 3376015

Insert the liner puller into the top of the cylinder block.

Note : The liner puller **must** be centered on the top of the cylinder block.

Turn the puller jackscrew **clockwise** to loosen the liner from the cylinder block.

Use both hands to remove the liner.

⚠ CAUTION ⚠

The liner puller must be installed and used as described to reduce the possibility of damage to the cylinder block. The puller plate must be parallel to the main bearing saddles and must not overlap the liner outside diameter.

Standard Liner Puller Method

Liner puller, Part Number 3163745, can be used as an alternative to the standard puller. The universal puller **must** be used with remover plate, Part Number 3822786.

Insert the liner puller into the top of the cylinder block.

Note : The liner puller **must** be centered on the top of the cylinder block.

Turn the puller jackscrew **clockwise** to loosen the liner from the cylinder block.

Use both hands to remove the liner.

Mark the cylinder number on each liner.

Clean and Inspect for Reuse

⚠ CAUTION ⚠

Do not use any abrasives in the ring travel area of the liner. The liner can be damaged.

Use a soft wire brush or a fine fibrous abrasive pad such as abrasive pad, Part Number 3823258, or equivalent, to clean the flange seating area.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the liners. Use solvent or steam. Dry with compressed air.

Use clean engine oil to lubricate the inside diameter of the liners.

Allow the oil to soak in the liner for 5 to 10 minutes.

Note : Use "lint-free" paper towels to wipe the oil from the inside of the liners.

Continue to lubricate the inside of the liners. Wipe clean until the paper towel does **not** show gray or black residue.

Inspect the liners for cracks on the inside and outside diameters.

Inspect for cracks under the flange.

Inspect the outside diameter and seat area for excessive corrosion or pitting.

Note : Pits **must not** be more than 1.6 mm [0.06 in] deep.

Replace the liner if the pits are too deep or if the corrosion can **not** be removed with fine emery cloth.

Inspect the inside diameters for vertical scratches deep enough to be felt with a fingernail.

Note : If a fingernail catches in the scratch, the liner **must** be replaced.

Inspect the inside diameter for scuffing or scoring.

Inspect the inside diameter for liner bore polishing.

A moderate polish produces a bright mirror finish in the worn area with traces of the original hone marks or an indication of an etch pattern.

A heavy polish produces a bright mirror finish in the worn area with no traces of hone marks or an etch pattern.

Replace the liner if:

- A heavy polish is present over 20 percent of the piston ring travel area.
- Both moderate and heavy polish over 30 percent of the piston ring travel area and one half (15 percent) is heavy polish.

Use dial bore gauge, Part Number 3376619, to measure the liner inside diameter in four places 90 degrees apart at the top and bottom of the piston travel area.

Cylinder Liner Inside Diameter		
mm		in
114.000	MIN	4.4882
114.040	MAX	4.4898

Measure the outside diameter of the liner top press fit area.

Cylinder Liner Out Diameter (Top Press Fit)		
mm		in
130.938	MIN	5.1550
130.958	MAX	5.1558

Measure the cylinder liner bore in the block. Refer to Procedure 001-026 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-026.html)

Install

⚠ CAUTION ⚠

Clean all deposits and debris from sealing surfaces A, B, and C. Use abrasive pad, Part Number 3823258 or equivalent, and cleaning solvent to polish the surfaces. Due to the critical machined tolerances, care should be taken not to remove any additional material.

Use the following procedure for inspection, reuse and repair guidelines if surface C has signs of cracking, fretting, or pitting. Refer to Procedure 001-026 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-026.html)

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

Clean the combustion deck. Use a gasket scraper or abrasive pad, Part Number 3823258, or equivalent, and diesel fuel or solvent.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Thoroughly flush the block. Use mineral spirits or cleaning solvent.

Remove the shop rags. Clean the crankshaft. Use a cleaning solvent.

Blow the cylinder bores and crankshaft dry. Wipe them clean with a lint-free cloth.

Lubricate surfaces A and B. Use clean engine oil.

Use clean oil to coat the liner o-ring seals.

Install new o-ring seals on the liners.

When reusing liners, install them in the same cylinder from where they were removed and rotate them 45 degrees (1/8 turn) from their original position. When correctly installed, any liner pitting **must** be positioned as illustrated so the pitted surface is rotated away from the location where pitting occurs.

Install the liner into the bore of the cylinder block. Use liner driver, Part Number ST 1229, or equivalent.

Use two cylinder head capscrews and position two liner clamps, Part Number 3822503, or equivalent, as illustrated.

Tighten the capscrews.

Torque Value: 68 n•m [50 ft-lb]

Remove the clamps. Repeat this procedure until all liners have been clamped and released.

Liner protrusion is the distance the liner protrudes above the block face.

Measure the liner protrusion at four points 90 degrees apart. Use gauge, Part Number 3164438, or equivalent.

Cylinder Liner Protrusion		
mm		in
0.026	MIN	0.0010
0.122	MAX	0.0048

The maximum allowable difference between adjacent cylinders is 0.051mm [0.002 in].

Note : If the liner protrusion varies more than 0.025 mm [0.0010 in] for 180 degrees:

- Install and tighten the liner clamps again.

Torque Value: 68 n•m [50 ft-lb]

- Measure the liner protrusion again.

Note : If the protrusion still varies more than 0.025 mm [0.0010 in]:

- Remove the liner.
- Inspect the liner sealing edge for burrs, dirt, or damage.
- Replace the liner if it is damaged.
- Install the liner again.
- Measure the liner protrusion.

Service Tip: If the out-of-limit condition is minimal, tolerance stack-up can allow the protrusion limits to be obtained by installing other new liners in the out-of-limit bore.

Note : Use the following procedure if the liner protrusion still does **not** meet the specifications. Refer to Procedure 001-058 in Section 1 (/qs3/pubsys2/xml/en/procedures/425/425-001-058.html) to machine the cylinder block liner counterbore for shims.

Use a feeler gauge to inspect the liner to block clearance at the four block casting points.

Cylinder Liner to Block Clearance		
mm		in
0.229	MIN	0.009

ANADOLU ISUZU PARTS SALES

Note : If the clearance is **less** than 0.229 mm [0.009 in]:

- Remove the liner.

- Inspect the liner and cylinder block for dirt or damage.

- Replace the liner if it is damaged.
- Install the liner again.

Measure the liner bore for out-of-roundness at points "C", "D", "E", "F", and "G". Measure each point in the direction "AA" and "BB". The bore **must not** be more than 0.04 mm [0.002 in] out-of-round.

Note : If the liner bore is more than 0.04 mm [0.002 in] out-of-round:

- Remove the liner so the cylinder block liner bore can be measured.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the pistons and connecting rods. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)
- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Install the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)

ANADOLU ISUZU DEALER SALES

- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Fill lubricating oil system. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Last Modified: 05-Feb-2019

Select Service Tools

Recommended Cummins® Service Tools

- RTV sealant, Part Number 3164067, or equivalent

Additional Service Items

- No additional service items required.

Preparatory Steps

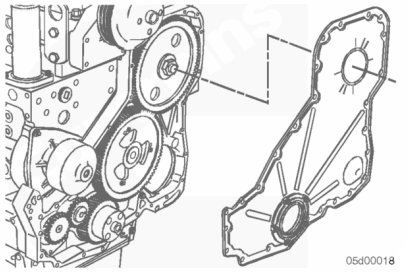
⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the crankshaft front seal. Refer to Procedure 001-023 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-023.html)

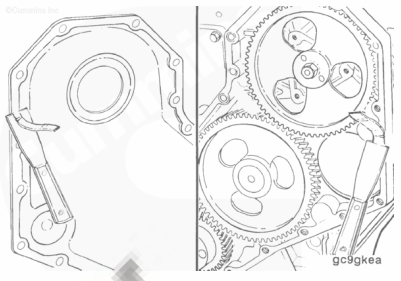
Remove

Remove the front gear cover.

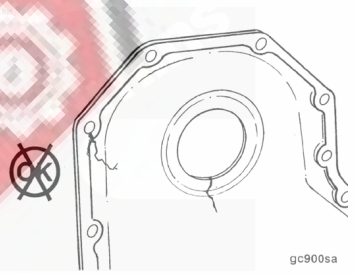


Clean and Inspect for Reuse

Clean sealant from the gear cover and gear housing gasket surface. Clean surfaces with isopropyl alcohol, parts cleaner, or contact cleaner.



Inspect the gear cover for cracks or other damage.

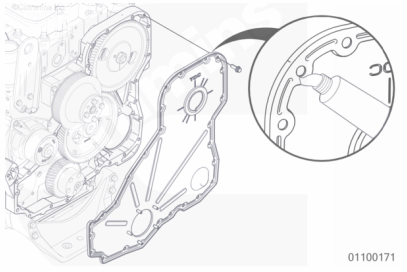


Install

Note : Apply sealant to the inside of the bolt holes.

Apply a thin bead of RTV sealant, Part Number 3164067, or equivalent, 3 to 4 mm [0.12 to 0.16 in] wide, to the engine side of the front cover **only**.

Install the front cover on the engine within 10 minutes.



Tighten the front cover capscrews in the sequence shown.

Torque Value:
Short Front Cover Mounting Capscrews 30 n•m [22 ft-lb]

Torque Value:
Long Front Cover Mounting Capscrews 40 n•m [30 ft-lb]

Select Service Tools

Recommended Cummins® Service Tools

- RTV sealant, Part Number 3823494, or equivalent

Additional Service Items

- Feeler gauge
- Common thread or very fine wire

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

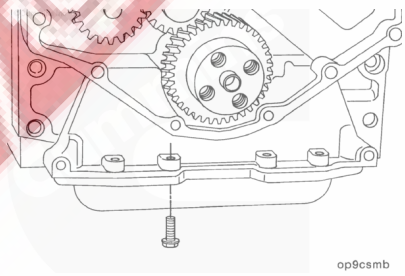
Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

- Disconnect the batteries. See equipment manufacturer service information.
- Shut off the fuel supply. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Remove the air compressor, if equipped. Refer to Procedure 012-014 in Section 12 (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)or see equipment manufacturer service information.
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)

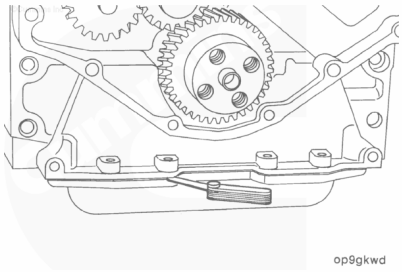
- Remove the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Remove the push rods. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Remove the fuel pump. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)
- Remove the camshaft gear. Refer to Procedure 001-012 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-012.html)
- Remove or disconnect gear driven accessories, such as air compressor and hydraulic pump.

Remove

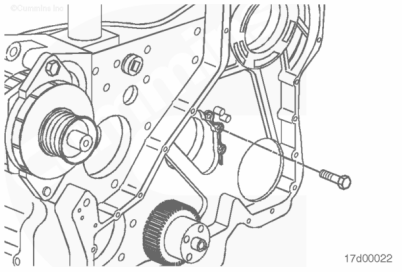
Remove the four front oil pan capscrews.



Separate the lubricating oil pan gasket from the gear housing. Use a feeler gauge.



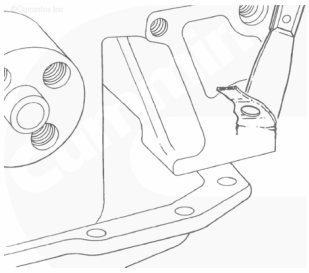
Remove the gear housing capscrews. Remove the gear housing.



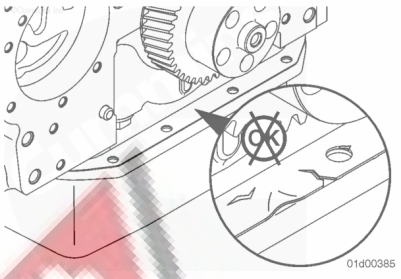
Clean and Inspect for Reuse

ANADOLU ISUZU AFTER SALES

Clean the gasket material from the cylinder block.

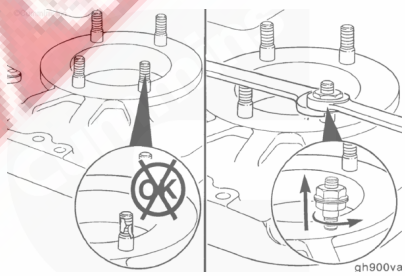


Inspect the lubricating oil pan gasket for tears or other damage. See the Install section of this procedure if the gasket is damaged.



Inspect fuel pump mounting studs for damage.

To install or remove the fuel pump studs, use two nuts locked together on the stud.



Inspect the gear housing sealing surfaces for cracks or other damage. Replace the gear housing if any damage is found.

Install

If the lubricating oil pan gasket is damaged, it can be repaired.

Cut the damaged gasket off even with the front of the cylinder block.

Use the old gasket as a template to cut the front section of a new gasket to the same size.

Note : The gear housing **must** be installed within 10 minutes of applying the sealant.

Clean the sealing surfaces.

ANADOLU ISUZU AFTER SALES

Coat the new gasket on both sides with RTV sealant, Part Number 3823494, or equivalent.

Make sure there is a bead of sealant at the intersecting joint of the cylinder block, oil pan, and gear housing.

Use common thread or a very fine wire to hold the new gasket splice in position as illustrated.

Position the gear housing gasket on the alignment dowels.

Use guide pins (M8 x 1.25 x 50) to assist in aligning the gasket and gear housing. Be sure to remove the guide pins after alignment.

Install the gear housing.

Torque Value: 40 n•m [30 ft-lb]

Start the lubricating oil pan capscrews in the holes **not** being used to tie the gasket in place.

Remove the thread or wire holding the gasket in place.

Install the remaining two lubricating oil pan capscrews. Tighten. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

- Install the camshaft gear. Refer to Procedure 001-012 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-012.html)
- Install the push rods. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Install the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Adjust the overhead. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Install the accessory drive or air compressor, if equipped. Refer to Procedure 012-014 in Section 12 (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html) or see equipment manufacturer service information.
- Install the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Install the front crankshaft seal. Refer to Procedure 001-023 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-023.html)
- Install the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Install the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Install the fuel pump. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)
- Install or connect gear driven or accessories. See equipment manufacturer service information.
- Open the fuel valve. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

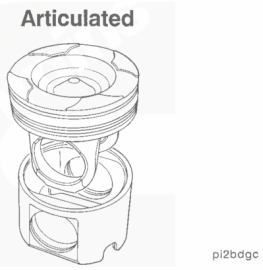
- Non-metallic brush
- Feeler gauge

General Information

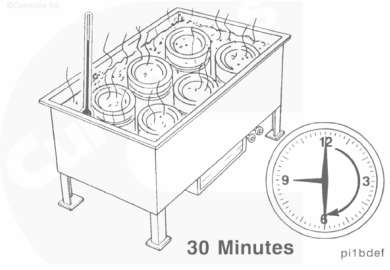
Some engines are equipped with articulated pistons. The articulated piston is a two (2) piece piston consisting of a forged steel crown and an aluminum skirt. An open chamber oil gallery is located on the underside of the crown of the piston to provide more oil contact with the piston and give better piston cooling.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ CAUTION ⚠

Do not use the bead blast method to clean the piston. The piston will be damaged by blast material embedded in the aluminum.

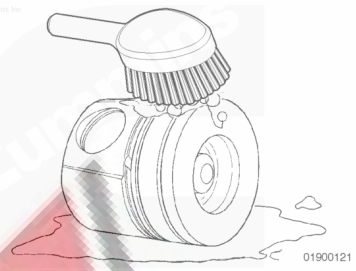
⚠ CAUTION ⚠

Do not clean the pistons and connecting rods in an acid tank.

Allow the piston to soak for a minimum of 30 minutes in a tank containing a cleaning solvent suitable for steel and aluminum.

⚠ CAUTION ⚠

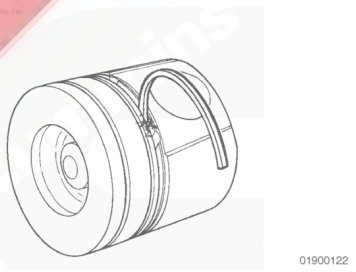
Do not use a metal brush. A metal brush will damage the piston ring grooves.



Wash the pistons and connecting rods in a strong solution of laundry detergent in hot water. Use a non-metallic brush to remove carbon deposits.

⚠ CAUTION ⚠

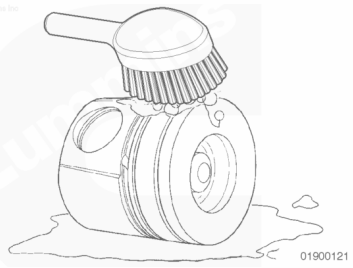
Do not use a ring groove cleaner to clean the ring grooves. Do not to scratch the ring sealing surface in the piston groove.



Clean the remaining deposits from the ring grooves with the square end of a broken piston ring.

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

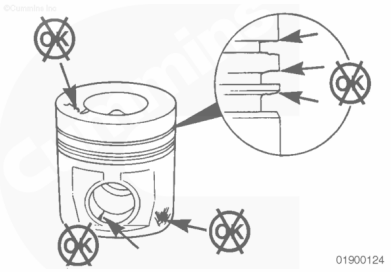
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Wash the pistons again in a detergent solution or solvent.

PARDOLU ISUZU PARTS SALES

After rinsing, used compressed air to dry.

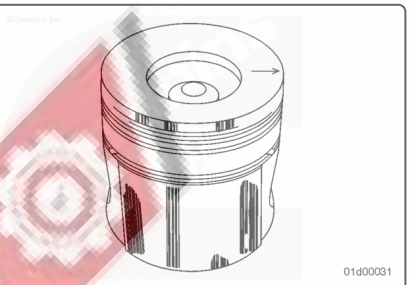
Failure Analysis Inspection



Inspect the piston for damage and excessive wear. Check the top, ring grooves, skirt, and pin bore for cracks or damage.

Note : If severe piston damage has occurred, check the turbocharger and other exhaust components for damage from debris.

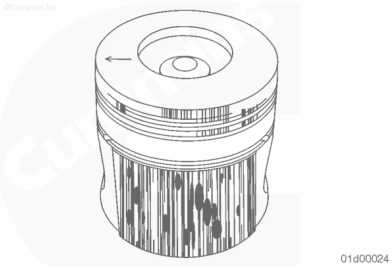
Abrasive and/or Debris Wear



Scratching on the piston skirt with material embedded in the piston can be caused by:

1. Ingested abrasive material
2. Inadequate cleaning during a previous repair
3. Particles embedded in the cylinder bore
4. Improper maintenance of the lubrication system
5. Debris in the lubrication oil system from another failure
6. Scuffing and scoring.

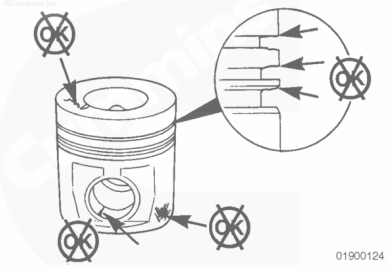
Scuffing and scoring can be caused by:



1. Engine overheating
2. Oil dilution
3. Improper maintenance of the lubrication system
4. Piston cooling nozzle malfunction
5. Oil rung plugged by deposits
6. Injector overfueling/engine running on an alternative fuel source, i.e. oil in the intake system.

Note : Scuffing and scoring on the piston rings indicates a breakdown of the oil film on the cylinder bore wall, causing transfer of material from the piston ring face to the cylinder bore wall.

Other Types of Piston Failures



Hydraulic Lock

Hydraulic locks (oil, fuel, or water) can cause the piston to split in half, or the lands can break and the connecting rods can be bent.

Dustouts

ANADOLU ISUZU AFTER SALES

Particular attention to the wear pattern of the intermediate (second) ring is required for diagnosis of a dustout piston scuff.

The ring will have a polished appearance on the full-face ear of the intermediate ring, where the blackened areas of the ring become more polished.

The polished area starts at the bottom of the ring and continues upward on the tapered ring.

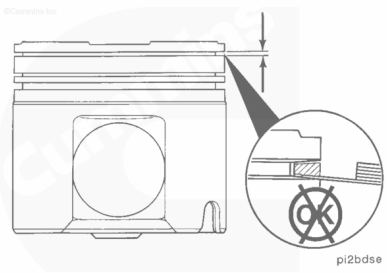
Occasionally, the edges of the rings are razor sharp, and the block cylinder bore has indications of ridges approximately 1-1/2 inches below the top deck.

Top of Piston Meltdown

The top of the piston appears to be melted down, and the failure resembles an overfueling situation such as a stuck injector. A plugged piston cooling nozzle can resemble this failure as well.

Measure

The ring groove can be inspected with a new ring and a feeler gauge.

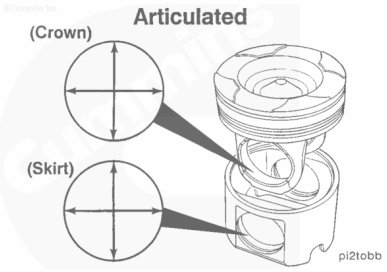


Hold a new ring in the groove even with the outside diameter of the piston.

Install a 0.15 mm [0.006 in] feeler gauge.

If the feeler gauge enters the groove without resistance, there is too much wear. Replace the piston.

Articulated Pistons

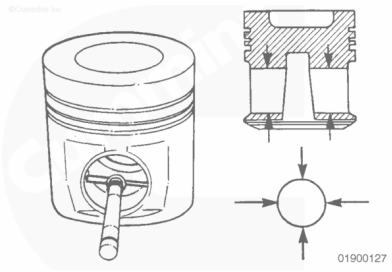


Measure the piston pin bore inside diameter on both the crown and skirt.

Articulated Piston Pin Bore Inside Diameter			
	mm		in
Crown	45.016	MIN	1.7723
	45.036	MAX	1.7731
Skirt	45.012	MIN	1.7721
	45.026	MAX	1.7727

ANADOLU ISUZU Genuine Parts

Single Piece Pistons

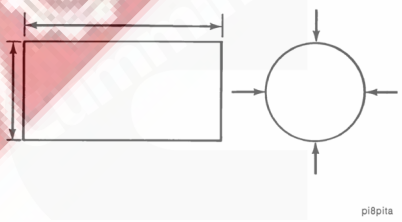


Measure the pin bore when the piston temperature is at 20°C [68°F].

Piston Pin Bore Diameter		
mm		in
45.010	MIN	1.7720
45.016	MAX	1.7723

Note : Add 0.013 mm or 0.0005 in to the bore diameter per 5°C [10°F] temperature rise up to 32°C [90°F].

Inspect the piston pin for nicks, gouges, and excessive wear.



Measure the piston pin outside diameter.

Piston Pin Diameter		
mm		in
44.997	MIN	1.7715
45.003	MAX	1.7718

Replace the piston pin if it is more than 0.003 mm [0.0001 in] out of round.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

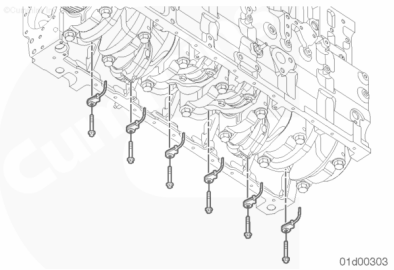
⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Remove the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)

Remove

Remove the piston cooling nozzle capscrews and nozzles.



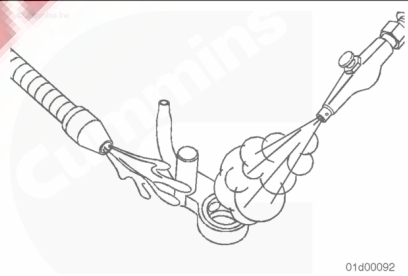
Note : The crankshaft **must** be rotated to allow access to remove the nozzles.

Note : The number six (6) piston cooling nozzle can **not** be removed without first disconnecting the connecting rod from the crankshaft and moving the piston out of the way. Also, a crow's foot socket will be required to access the capscrew.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggle and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

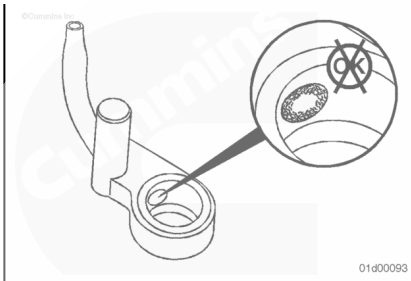
Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

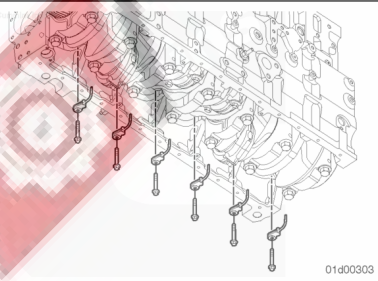
Clean the piston cooling nozzles and capscrew. Use solvent. Dry with compressed air.

Inspect the piston cooling nozzles for flow restriction or any other damage. Replace if necessary.



Install

Note : The crankshaft **must** be rotated to allow access to install the nozzles.



Install the piston cooling nozzles and capscrews.

Tighten the capscrews.

Torque Value: 33 n•m [24 ft-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Fill the engine with lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for oil leaks.

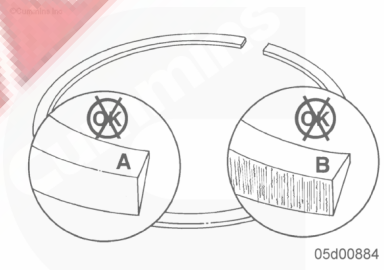
Failure Analysis Inspection

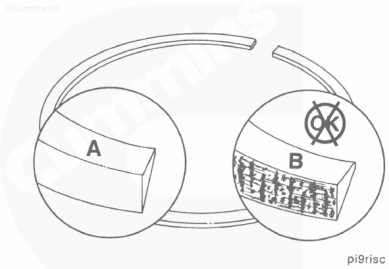
Inspect the piston rings for abrasive wear.



Note : Abrasive wear of the intermediate ring can be indicated by a rapid reduction of the dark finish coating on the front face of the ring, in some cases to the point where the dark finish coating is no longer visible (A). This is commonly referred to as full face ring wear. This rapid reduction will typically leave a sharp edge on the bottom of the intermediate ring. Abrasive wear can also be indicated by concentrated vertical scratches on the top ring (B).

Abrasive wear can be caused by:

1. Ingested abrasive material
2. Inadequate cleaning during a previous repair
3. Particles embedded in the bore
4. High soot content in the lubricating oil from extended oil drain intervals
5. Scuffing and scoring.



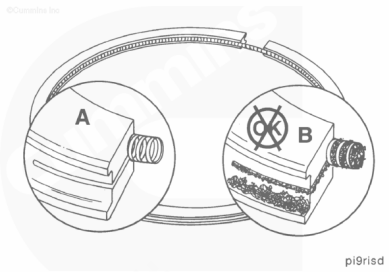
Note : Scuffing and scoring is indicated by heavy scratches, metal discoloration, and voids (B).

Scuffing and scoring can be caused by:

1. Engine overheating
2. Oil dilution
3. Improper maintenance of the lubrication system
4. Piston cooling nozzle malfunction
5. Oil ring plugged by deposits.

Note : Scuffing and scoring on the piston rings indicates a breakdown of the oil film on the cylinder bore wall, causing transfer of material from the piston ring face to the cylinder bore.

Note : Oil ring plugging is indicated by deposits on the oil ring grooves (B).



Oil ring plugging can be caused by:

1. Low engine operating temperatures - long periods of idling or a cooling system malfunction
2. Extended oil change intervals
3. Use of the wrong grade of engine oil
4. Use of a poor quality engine oil.

Note : Plugging of the oil ring drains restricts oil drain-back, which floods the piston ring belt area, resulting in a loss of oil control.

Note : The following measurements are intended for inspecting new piston rings.

Note : Before completing this inspection, make sure the cylinder liner is within specification. Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)

Measure the piston ring gap by installing the piston rings into the cylinder bore in which they will be used. Position the rings below the ring reversal area by positioning each ring in the cylinder 89 mm [3.5 in] below the top deck (A). Use a piston to square the rings with the bore.

The installation location for the compression rings can be determined by the finish.

- The top ring has a chrome finish.
- The intermediate ring has a phosphate (black) finish.

The oil control ring is a two-piece ring made of an expander and two rails. The expander is installed between the two rails.

Use a feeler gauge to measure the gap.

Aluminum Piston Ring Gap			
	mm		in
Top Ring	0.300	MIN	0.012

	0.525	MAX	0.021
Intermediate Ring	0.850	MIN	0.033
	1.275	MAX	0.050
Oil Control Ring	0.300	MIN	0.012
	0.725	MAX	0.028

Steel Articulated Piston Ring Gap			
	mm		in
Top Ring	0.300	MIN	0.012
	0.525	MAX	0.021
Intermediate Ring	0.400	MIN	0.016
	0.825	MAX	0.032
Oil Control Ring	0.300	MIN	0.012
	0.725	MAX	0.028

If the piston ring gap is **not** within specification:

1. Verify the correct type and part number piston ring is being used.
2. Verify the cylinder liner is within specification. Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)
3. Verify the piston ring gap measurement is being taken 89 mm [3.5 in] below the cylinder block deck.
4. Try another set of piston rings.

Additional Service Items

- No additional service items required.

Preparatory Steps

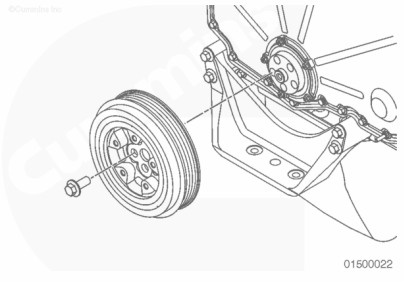
⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the fan and fan shroud, if necessary.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the crankshaft pulley, if applicable. Refer to Procedure 001-022 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-022.html)
- Remove the crankshaft adapter, if applicable. Refer to Procedure 001-017 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-017.html)

Remove

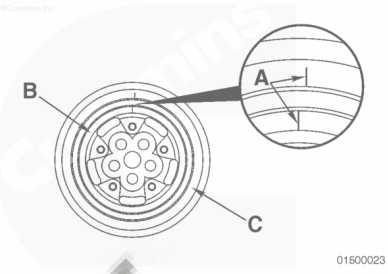
Remove the vibration damper.



Inspect for Reuse

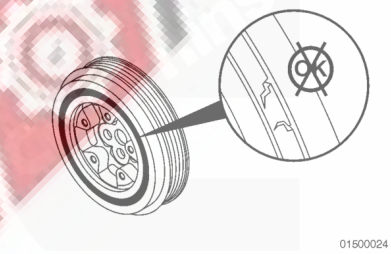
Check the index lines (A) on the damper hub (B) and inertia member (C). If the lines are more than 1.59 mm [1/16 in] out of alignment, replace the damper.

Inspect the vibration damper hub (B) for cracks. Replace the damper if the hub is cracked.



Inspect the rubber member for deterioration. If pieces of rubber are missing or if the elastic member is more than 3.18 mm [1/8 in] below the metal surface, replace the damper.

Note : Also, look for forward movement of the damper ring on the hub. Replace the damper if any movement is detected.

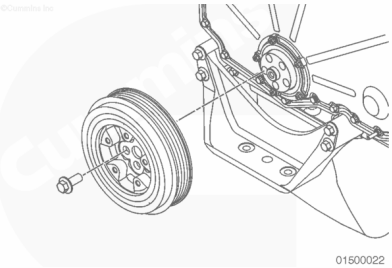


Install

Install the vibration damper.

Tighten the capscrews in a star pattern.

Torque Value: 200 n•m [148 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

Additional Service Items

- No additional service items required.

Preparatory Steps

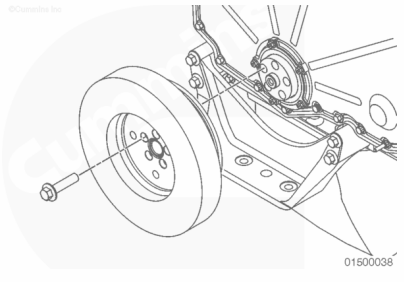
⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the fan and fan shroud, if necessary.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the crankshaft pulley, if applicable. Refer to Procedure 001-022 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-022.html)
- Remove the crankshaft adapter, if applicable. Refer to Procedure 001-017 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-017.html)

Remove

Remove the vibration damper.

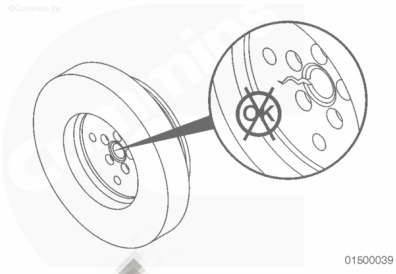


Inspect for Reuse

Check the mounting web for cracks.

Check the housing for dents or raised surfaces.

Replace the damper if any of this damage is identified.

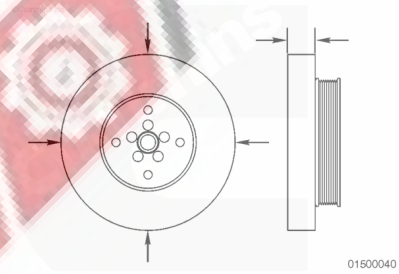


The viscous damper is filled with a silicone fluid. After many hours of use, the silicone fluid can become thicker and expand.

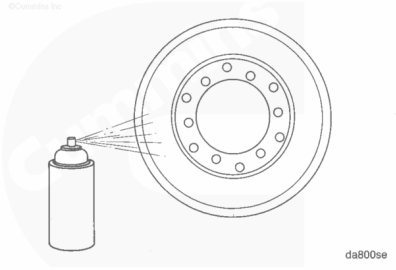
To determine if the damper thickness is correct, remove the paint from the damper in four locations on either side of the damper. Measure and record the thickness of the damper in four places.

Measure the thickness 3.175 mm [0.125 in] from the outside of the damper.

Replace the damper if its thickness varies by more than 0.25 mm [0.010 in].

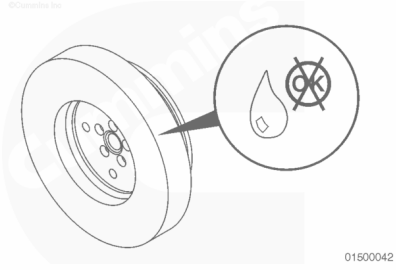


Spray the damper with spot check developer, type SKD-S2, or equivalent.



Check for fluid leakage.

If there is leakage replace the damper.



ANADOLU ISUZU AFTER SALES

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

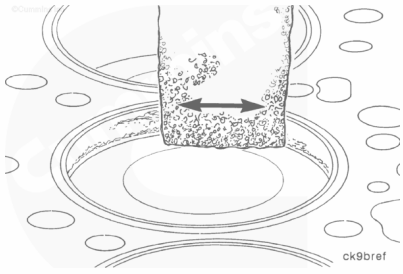
Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Remove the piston cooling nozzles, if required. Refer to Procedure 001-046 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-046.html)
- Remove the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)

Remove

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

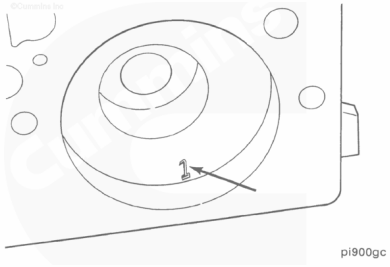
Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

Rotate the crankshaft until the pistons are just below the carbon deposits found above the ring travel area.

Use abrasive pad, Part Number 3823258, or equivalent, and solvent to remove the carbon deposits.

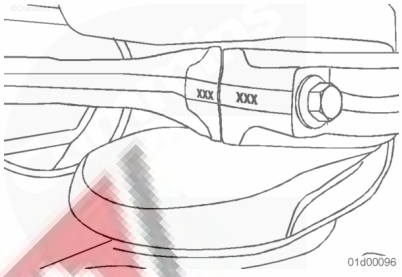
ANADOLU ISUZU DEALER SALES

Mark each piston according to the cylinder location.



Rotate the crankshaft to position the rod cap at bottom dead center (BDC) for removal.

A unique number (**not** cylinder number) is stamped on the connecting rod and matching cap. When the rods and caps are installed in the engine, the numbers on the rods and caps **must** match and be installed on the same side of the engine. Before the rods are removed they should be marked for position (numbers 1 through 6) and orientation (front of engine) so they are installed in the same orientation.



Loosen the connecting rod capscrews.

Note : Do **not** remove the capscrews from the rods at this time.

Use a rubber hammer to hit the connecting rod capscrews to loosen the caps from the dowels.

Remove the capscrews, connecting rod cap, and lower connecting rod bearing.

Mark the cylinder number and the letter "L" (lower) on the flat surface of the bearing tang.

⚠ CAUTION ⚠

Do not damage the fracture-split surface on the connecting rod or connecting rod cap while the connecting rod caps are removed. If the fractured split surface is damaged, the connecting rod and connecting rod cap must be replaced to help reduce the possibility of engine damage. Incorrect assembly can damage the rod.

Install two connecting rod guide pins, Part Number 3824496.

Use a "T-handle" piston pusher to push the rod away from the crankshaft.

ANADOLU ISUZU PARTS SALES

Push the connecting rod and piston assembly out of the cylinder bore. Care **must** be taken to **not** damage the connecting rod or bearing.

Remove the upper rod bearing.

Mark the cylinder number and the letter "U" (upper) on the flat surface of the bearing tang.

Use both hands to remove the piston and connecting rod assembly.

If parts are reused, the piston and connecting rod assemblies **must** be installed in the same cylinder locations from which they were removed to provide the proper fit of worn mating surfaces.

Use tags to mark the piston and connecting rod assembly locations as they are removed.

Place the rod and piston assemblies in a container to protect them from damage.

Disassemble

Use piston ring expander, Part Number 3823137, to remove the piston rings.

Use internal snap ring pliers to remove the snap rings from both sides of the piston.

Remove the piston pin.

Note : Heating the piston is **not** required.

⚠ CAUTION ⚠

Do not use a hammer to remove the piston pins. The piston can distort, causing it to seize in the liner.

If the piston pin can not be easily removed by hand:

- Install the piston and rod assembly in a container of water.

PARDOLU ISUZU PARTS SALES

- Heat the piston in boiling water for 15 minutes.
- Use a blunt tool to push the piston pin from the piston and rod assembly.

Note : When the piston pin is removed from an articulated piston, the skirt will separate from the crown. Use care to prevent damage to the piston.

Mark the parts with the number of the cylinder from which the piston, crown, skirt, and pin were removed to make sure they are installed in the correct cylinder location, if they are to be reused.

Clean and Inspect for Reuse

Clean the pistons. Refer to Procedure 001-043 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-043.html)

Inspect the pistons. Refer to Procedure 001-043 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-043.html)

Inspect the connecting rods. Refer to Procedure 001-014 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-014.html)

Assemble

Single-Piece Piston

Install the retaining ring in the pin groove on one side of the piston.

Lubricate the pin and pin bores. Use engine lubricating oil.

⚠ CAUTION ⚠

Make sure "front" marking on the piston and the numbers on the rod and cap are oriented as illustrated.

ANADOLU ISUZU

Align the pin bore of the rod with the pin bore of the piston skirt. Install the piston pin.

⚠ CAUTION ⚠

Do not use a hammer to install the piston pin. The piston can distort, causing it to seize in the liner.

- Install the pin through the piston and connecting rod.

Note : Pistons do **not** require heating to install the pin. However, the pistons do need to be at room temperature or above.

Install the second retaining ring.

⚠ CAUTION ⚠

Most piston rings look similar but have significant difference. Make sure the correct part number is being used for the engine.

The top surface of the upper and intermediate rings are identified either with the word "TOP" or a supplier identification mark, such as a dot. Assemble with the word "TOP" or the supplier mark facing upward.

The bottom, or oil control ring, can be installed with either side up.

Note : The two-piece oil control ring **must** be installed with the expander ring gap 180 degrees from the gap of the oil ring.

Use piston ring expander, Part Number 3823137, to install the rings on the piston.

Position the oil ring expander in the oil control ring groove.

Articulated Piston

Note : If the pistons are being reused, the crown, skirt, and pin **must** be matched as they were when

they were removed.

Position the skirt over the piston crown.

Note : It is **not** necessary to heat the articulated pistons before assembly. The piston pin is a slip fit.

Install the retaining ring in the pin groove on one side of the piston.

⚠ CAUTION ⚠

Do not use a hammer to install the piston pin. The piston can distort, causing it to seize in the liner.

Lubricate the pin and pin bores. Use engine lubricating oil.

Align the pin bore of the rod with the pin bore of the piston skirt and crown. Install the piston pin.

⚠ CAUTION ⚠

The snap ring must be seated completely in the piston groove to prevent engine damage during engine operation.

Install the second retaining ring.

⚠ CAUTION ⚠

Most piston rings look similar but have significant difference. Make sure the correct part number is being used for the engine.

The top surface of the upper and intermediate rings are identified either with the word "TOP" or a supplier identification mark, such as a dot. Assemble with the word "TOP" or the supplier mark facing upward.

The bottom, or oil control ring, can be installed with either side up.

Note : The two-piece oil control ring **must** be installed with the expander ring gap 180 degrees from the gap of the oil ring.

ANADOLU ISUZU SPARE PARTS SALES

Use piston ring expander, Part Number 3823137, to install the rings on the piston.

Position the oil ring expander in the oil control ring groove.

Install

The cylinder block and all parts **must** be clean before assembly. Inspect the cylinder liners for reuse.

Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)

Clean the connecting rods and bearing shells. Use a clean, lint-free cloth.

Do **not** lubricate the backside of the bearing shells. The operating clearance of the bearing will be reduced and the bearing can be damaged during engine operation.

If new bearings are **not** used, the used bearings **must** be installed on the same connecting rod and location from where they were removed.

The 180 degree thrust washers are designed to separate from the main bearing shell in operation. If reuse guidelines are met for the thrust bearing, the thrust bearing can be reused. Use the following procedure for more information. Refer to Procedure 001-006 in section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-006.html)

Install the upper bearing shell into the connecting rod.

The tang of the bearing shell (1) **must** be in the slot of the rod (2). The end of the bearing shell **must** be even with the cap mounting surface.

Use assembly lubricant, Part Number 3163087, or equivalent, to coat the inside circumference of the bearing shell.

Apply a film of clean engine oil to the cylinder liner.

Lubricate the rings and piston skirts. Use clean engine lubricating oil.

Rotate the rings to position the ring gaps, as shown.

Note : The ring gap of each ring **must not** be aligned with the piston pin, or with any other ring. If the ring gaps are **not** aligned correctly, the rings will **not** seal properly.

Use piston ring compressor, Part Number 3164604, to compress the rings.

Install connecting rod guide pins, Part Number 3824496.

Rotate the crankshaft so the connecting rod journal of the connecting rod being installed is at BDC.

⚠ CAUTION ⚠

Omission of this step will result in extensive engine damage.

Note : For all piston types make sure that the "FRONT" marking on the piston crown is pointed toward the front of the engine block.

A unique number (**not** cylinder number) is stamped on the connecting rod and matching cap. When the rods and caps are installed in the engine, the numbers on the rods and caps **must** match and be installed on the same side of the engine. The rods **must** be installed in the same position (numbers 1 through 6) and orientation (front of engine) from which they were removed.

Align the piston crown deep valve pocket on the exhaust side of the engine.

Insert the connecting rod through the cylinder liner until the ring compressor contacts the top of the liner.

Hold the ring compressor against the cylinder liner.

Push the piston through the ring compressor and into the cylinder liner.

Push the piston until the top ring is completely in the cylinder liner.

Note : If the piston does **not** move freely, remove the piston and inspect for broken or damaged rings.

Carefully push the piston into the bore while guiding the connecting rod to the crankshaft journal.

Note : If new bearings are **not** used, the used bearings **must** be installed on the same connecting rod cap from which they were removed.

Install the bearing in the connecting rod cap.

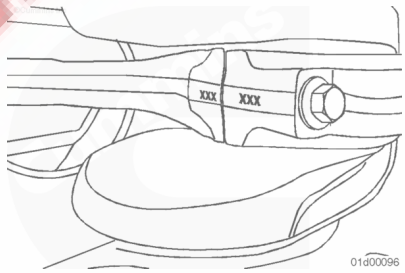
The tang of the bearing (2) **must** be in the slot of the cap (1).

Use assembly lubricant, Part Number 3163087, or equivalent, to coat the inside diameter of the bearing shell.

Use clean engine oil to lubricate the connecting rod capscrew threads.

⚠ CAUTION ⚠

Do not damage the fracture-split surface on the connecting rod or connecting rod cap while the connecting rod cap is removed. If the fracture-split surface is damaged, the connecting rod and connecting rod cap must be replaced to help reduce the possibility of engine damage.



The connecting rod and cap **must** have the same number and **must** be installed in the proper cylinder. The connecting rod cap number and rod number **must** be on the same side of the connecting rod to prevent engine damage during engine operation.

- Install the connecting rod cap and capscrews.
- Use a marked socket and torque wrench to tighten the connecting rod capscrews.
- Use the torque plus angle method to tighten the connecting rod capscrews in alternating sequence.

Torque Value:

Connecting Rod Capscrews

1. 60 n•m [44 ft-lb]
2. Loosen capscrews.
3. 30 n•m [22 ft-lb]
4. 50 n•m [36 ft-lb]

5. Advance 60 degrees.

Note : Do **not** measure the clearance between the rod cap and crankshaft.

Measure the side clearance between the connecting rod and crankshaft.

Connecting Rod and Crankshaft Side Clearance		
mm		in
0.10	MIN	0.004
0.30	MAX	0.012

Check for freedom of rotation as the connecting rod caps are installed. If the crankshaft does **not** rotate freely, check the installation of the connecting rod bearings and bearing size.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the piston cooling nozzles, if required. Refer to Procedure 001-046 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-046.html)
- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Install the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Fill the engine with lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Last Modified: 14-Sep-2016

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

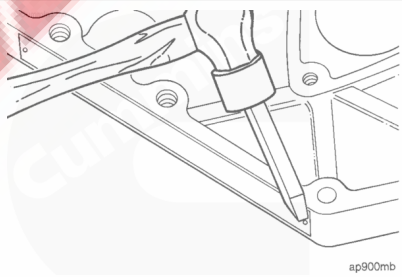
- Hammer
- Chisel

Remove

Remove the rivets securing the engine dataplate.

Note : If the dataplate is to be reused, care **must** be taken **not** to damage the data on the plate.

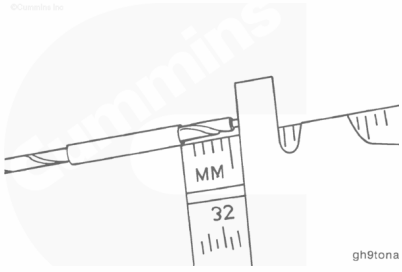
Pry out the rivet by using a hammer to drive a flat chisel under the head of the rivet.



Install

⚠ CAUTION ⚠

When drilling holes for the dataplate location, do not completely drill through the mounting location. Drill only deep enough to install the new blind rivets. Drilling through will result in an oil leak.



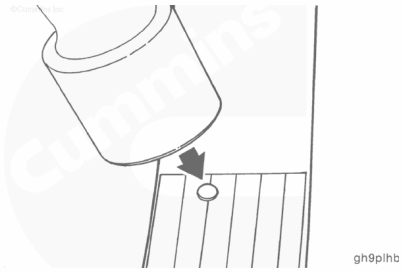
If attaching the dataplate to a new component or if the old rivet locations are damaged, drill new 2 mm [0.066 in] diameter holes and attach with new blind rivets.

Note : The dataplate should be located in the same area as it was previously installed.

Note : Mark the drill bit at 6.0 mm [0.236 in] to avoid drilling too deep in the gear housing.

ANADOLU ISUZU AFTERSALES

Drive the rivets in until they contact the dataplate.



⚠ CAUTION ⚠

If the rivets are driven in too far, they will cut through the dataplate.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

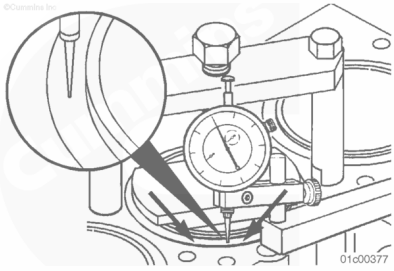
- Disconnect the batteries. See equipment manufacturer service information.
- Drain the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Remove the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Remove the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Remove the block stiffener plate. Refer to Procedure 001-089 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-089.html)
- Remove the piston cooling nozzles. Refer to Procedure 001-046 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-046.html)
- Remove the piston and connecting rod assemblies. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)

Initial Check

This repair procedure describes the method for machining the cylinder liner counterbore ledge using the Cylinder Block Counterbore Cutting Kit, Part Number 5299988. The tool is designed to be used for light clean-up cuts.

This procedure can be performed in or out of chassis.

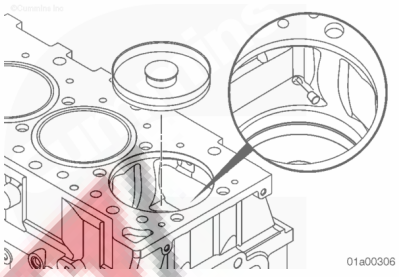
Liner protrusion should be checked and verified. Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)



Remove the cylinder liner of the cylinder being cut. Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)

Refer to the Cylinder Liner Counterbore Ledge Reuse Guidelines, Bulletin 4383753 (/qs3/pubsys2/xml/en/bulletin/4383753.html), to inspect the counterbore ledge surface areas for signs of pitting, fretting, or wear.

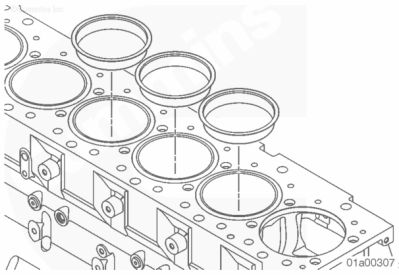
If fretting or wear is present on any cylinder, all six cylinders **must** be machined.



Machine

Cover the crankshaft, and plug any oil hole galleries and coolant passages to prevent machining chips from entering. Install cylinder bore plug, Part Number 5299991, into the cylinder bore.

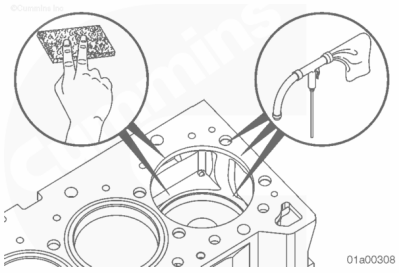
Install protective plug, Part Number 5299207, into the adjacent cylinders that are **not** being cut.



Make sure the top deck of the cylinder block is clean and free of burrs.

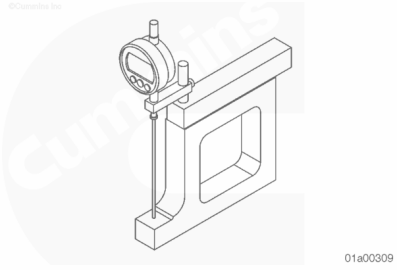
Use a medium grit stone, or equivalent, to clean the deck of the block and the counterbore ledge.

Vacuum and remove any debris from the deck of the block, counterbore ledge, and cylinder head capscrew holes.

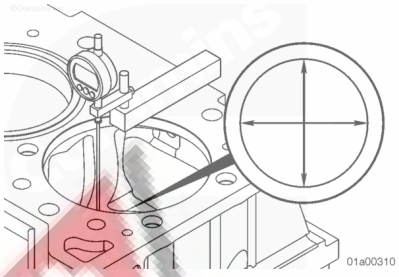


Zero the counterbore depth gauge assembly, Part Number 3164438, with the locating gauge, Part Number 5299989.

This will set the indicator to the original machining depth of 123 mm [4.843 in] from the cylinder deck to the counterbore ledge.

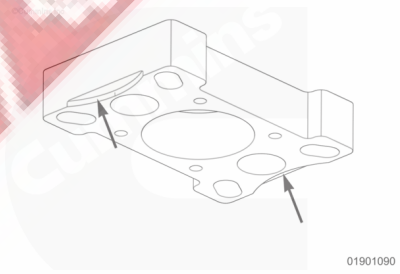


Measure the counterbore ledge in four locations in a crisscross pattern and mark the lowest point. Subtract the lowest number from the highest number. This is the minimum amount to be machined for clean-up to make the counterbore ledge even all the way around.



Use 30W non-detergent oil to lubricate the counterbore ledge cutter drive unit, Part Number 3163785. Fill the reservoir with 30W oil to maintain lubrication on the counterbore drive unit while machining the counterbore ledge. Assemble the mounting plate, Part Number 5299990, to the counterbore drive unit with the four hex key screws provided with the liner scallops facing down and tighten in a crisscross pattern.

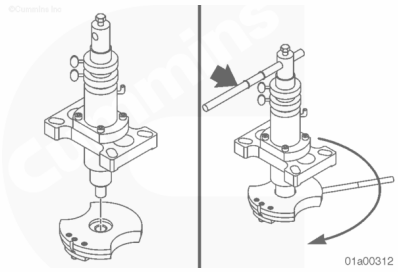
Torque Value: 27 n•m [239 in-lb]



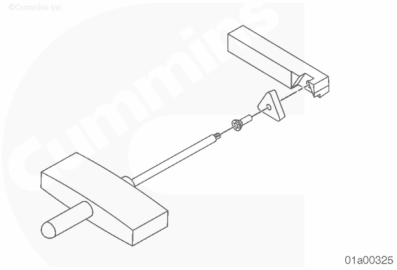
⚠ CAUTION ⚠

Make sure of proper installation of the counterbore cutter bit. Damage will occur if improperly installed.

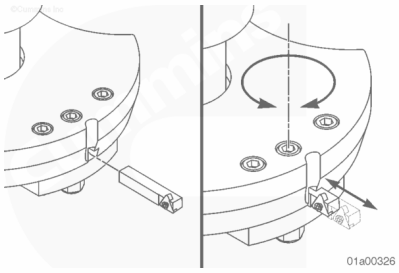
Install the cutter plate, Part Number 5299993, to the counterbore drive unit. Use the cutter plate holder to tighten securely. The hole in the side of the cutter plate accepts the holder.



Position the cutter bit insert so the tapered edge faces the cutter bit. Install the cutter bit screw into the center of the cutter bit insert. The cutter bit insert is machined to allow the cutter bit screw to be fully recessed. Tighten the screw, using the provided cutter bit wrench, until the insert is fully seated against the cutter bit. Loosen the screw and tighten it again until there is no visible air gap around the insert and the bit.



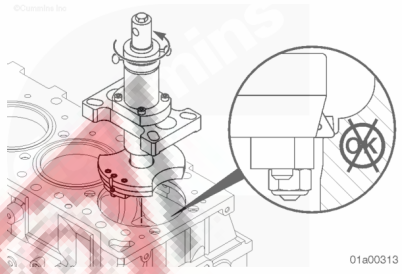
Install the cutter bit, Part Number 5296531, into the cutter plate. The cutter bit must be installed with the part number facing to the left and the cutting edge facing to the left, as viewed from the bottom of the cutter plate. Make sure of proper installation of the cutter bit, as damage will occur if improperly installed.



Fully retract the cutter bit using the provided hex key wrench. Make sure the cutter bit can extend and retract freely.

Make a paint pen mark on the counterbore ledge. This will indicate the machined area during the repair.

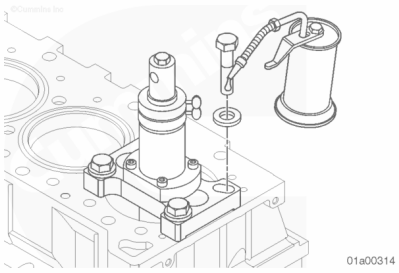
Position the counterbore ledge cutter unit into the cylinder bore by backing off the upper depth set collar and lower depth set collar in a **counterclockwise** direction.



This will allow the counterbore ledge cutting plate to lower and center itself on the counterbore ledge.

Care **must** be taken to verify that the base plate of the counterbore ledge cutting tool is positioned flat on the deck surface of the cylinder block, and the cutting plate is centered into the counterbore ledge with no side-to-side movement.

Secure the base plate to the cylinder block with the capscrews, special washers, and spacers included with the tool. Capscrews need to be lubricated with engine oil, installed hand-tight, and then tightened in a crisscross pattern.



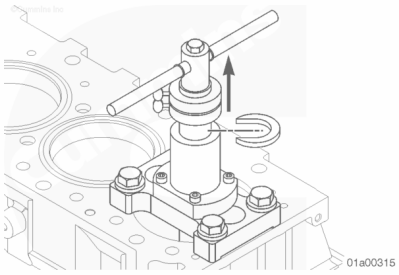
Torque Value: 67 n•m [49 ft-lb]

Install the T-handle onto the counterbore ledge cutter unit and adjust the lower stop collar in a **clockwise** rotation 0.127 mm [0.005 in] (each graduation on the collar is 0.025 mm [0.001 in]) to raise the cutter plate off the counterbore ledge and rotate the tool **clockwise**. Tighten the lower stop collar thumbscrew after every adjustment. No contact should be made with the counterbore ledge.

Note : If adequate clearance is **not** available, a 1/2 inch drive ratchet and 15/16 inch socket can be used in place of the T-handle for counterbore drive unit rotation.

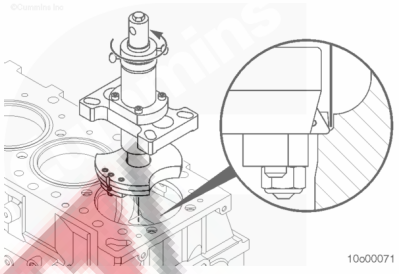
Raise the counterbore ledge cutter by grasping the T-handle and pulling in an upward motion.

Install the depth set collar (C-spacer) below the lower depth set collar and lower the tool until it makes contact with the depth set collar.



⚠ CAUTION ⚠

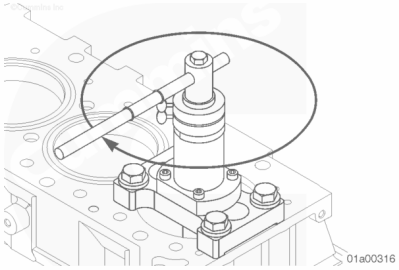
Make sure the cutter bit does not contact the step machined into the counterbore ledge. Damage to the cylinder block will occur during machining if the cutter bit is contacting the step.



Install a 0.812 mm [0.032 in] feeler gauge between the counterbore ledge wall and the cutter bit. This will make sure that the cutter bit does **not** make contact with the step machined into the counterbore ledge.

Extend the cutter bit with the hex key wrench installed in the friction screw until the cutter bit makes contact with the feeler gauge. Lock the bit down by tightening the two cutter bit hold-down capscrews with the hex key wrench.

Note : If adequate clearance is **not** available, a 1/2 inch drive ratchet and 15/16 inch socket can be used in place of the T-handle for counterbore drive unit rotation. The ratchet handle should initially be positioned so that it is directly above the cutter bit or as closely behind it as possible.



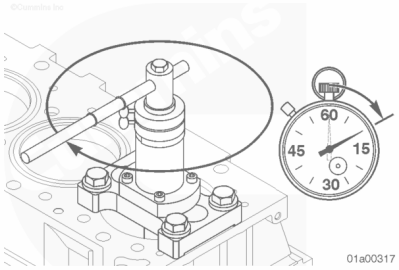
Rotate the counterbore ledge cutter unit **clockwise** for 360 degrees. A slight noise may be heard.

Lower the counterbore ledge cutter unit by adjusting the lower depth set collar in a **counterclockwise** rotation, until the cutter bit makes contact with the counterbore ledge. Raise the counterbore cutter unit 0.127 mm [0.005in] by adjusting the lower depth set collar in a **clockwise** direction.

Tighten the lower depth set collar thumbscrew. Rotate the counterbore ledge cutter unit **clockwise** for 360 degrees. No noise should be heard.

Loosen the two cutter bit hold down capscrews with the hex key wrench and extend the cutter bit until it makes contact with the counterbore ledge wall. Lock the cutter bit.

Lower the counterbore ledge cutter unit by 0.025 mm [0.001 in] at a time, while rotating the unit 360 degrees **clockwise** by adjusting the lower depth set collar in a **counterclockwise** rotation until it makes contact with the counterbore ledge.

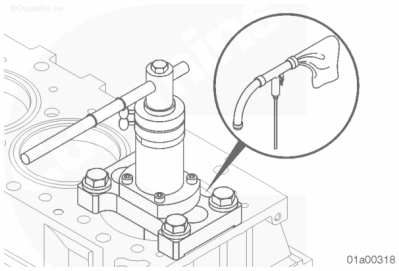


With the cutter bit making full contact with the counterbore ledge, rotate the counterbore ledge cutter unit 360 degrees **clockwise** to clean up the counterbore ledge. Observe the change made to the paint pen mark to confirm correct cutter bit extension.

Note : If adequate clearance is **not** available, a 1/2 inch drive ratchet and 15/16 inch socket can be used in place of the T-handle for counterbore drive unit rotation. The ratchet handle should initially be positioned so that it is directly above the cutter bit or as closely behind it as possible.

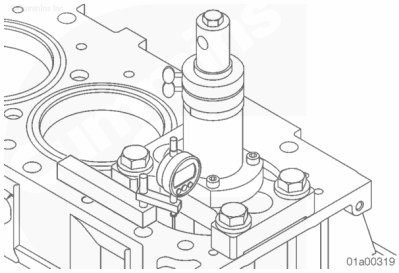
Note : Care **must** be taken to maintain consistent downward pressure on the top of the T-handle or ratchet head during the cutting portion of the stroke. Each 360 degree revolution should take at least 10 seconds. Any deviation in speed will result in chatter on the counterbore ledge.

Remove any chips on the counterbore ledge with a chip removing unit, Part Number 3823461.



With the counterbore depth dial indicator, Part Number 3164438, measure the depth of the counterbore ledge. This will determine what the final cut depth will be.

Note : Counterbore ledge machining should **not** exceed the thickness of the largest available shim.

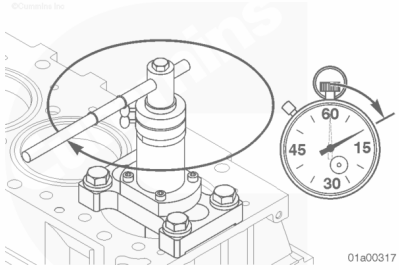


Adjust the upper depth set collar **counterclockwise** to the final depth cut.

Example: If cutting 0.127 mm [0.005 in], adjust the upper depth set collar to contact the lower depth step collar and then back it off 0.127 mm [0.005 in].

ANADOLU ISUZU AFTER SALES

Adjust the lower depth set collar **counterclockwise** 0.025 mm [0.001 in] at a time until the final cut is reached. Tighten the thumbscrew after each adjustment. A cut is complete when the lower depth set collar is firmly contacting the c-ring.

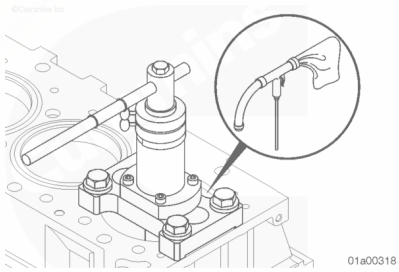


Rotate the counterbore ledge cutter unit **clockwise** with the T-handle positioned so the long portion of the handle is directly above the cutter bit.

Note : If adequate clearance is **not** available, a 1/2 inch drive ratchet and 15/16 inch socket can be used in place of the T-handle for counterbore drive unit rotation. The ratchet handle should initially be positioned so that it is directly above the cutter bit or as closely behind it as possible.

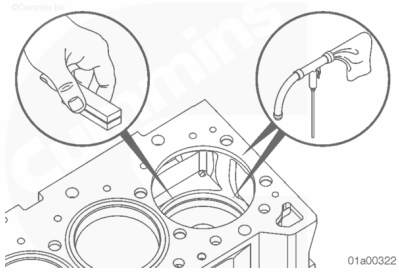
Note : Care **must** be taken to maintain consistent downward pressure on the top of the T-handle or ratchet head during the cutting portion of the stroke. Each 360 degree revolution should take at least 10 seconds. Any deviation in speed will result in chatter on the counterbore ledge.

The counterbore ledge **must** be vacuumed out before each measurement.



Note : It is recommend stopping with 0.025 mm [0.001 in] left to cut and take one final measurement to verify the cutting depth.

Adjust the lower depth set collar by rotating it **clockwise** to raise the cutter plate off the counterbore ledge.



Loosen the two cutter bit hold-down capscrews with the hex key wrench and retract the cutter bit into the cutter plate.

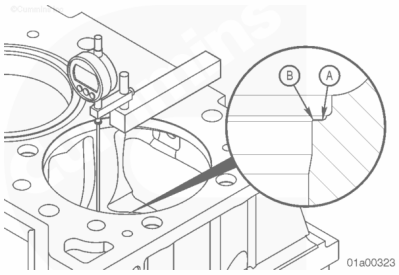
Remove the capscrews that secured the counterbore ledge cutter unit to the deck of the cylinder block and remove the tool from the engine.

Clean any machined chips from the counterbore chip catcher, counterbore ledge, and the deck of the cylinder block. Use a medium grit stone, or equivalent, to clean up the leading edge of the counterbore ledge.

With the counterbore depth gauge assembly, Part Number 3164438, measure the depth of the counterbore ledge and the ledge angle in four places.

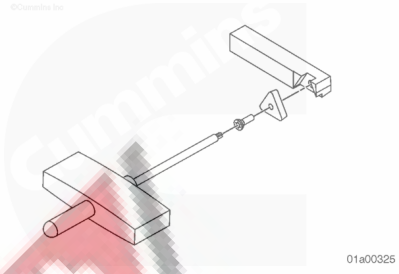
The four measurements **must not** vary more than 0.025 mm [0.001 in]. If the measurements exceed the specifications, the counterbore ledge **must** be machined again.

Dimension A should be 0.0127 mm [0.0005 in] lower or equal to Dimension B.



Remove the chip catcher and any oil gallery or coolant passage plugs that were installed.

Inspect the counterbore seating area for cracking using Crack Detection Kit, Part Number 3375432, or equivalent. If there are any cracks present, the block counterbore ledges may be machined to the next shim thickness, if a thicker shim is offered.

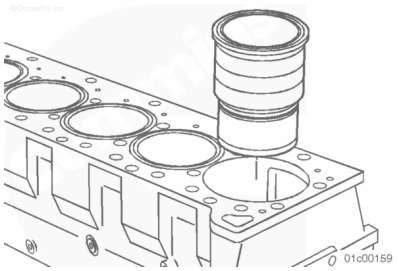


Note : Do **not** remove more material from the counterbore ledge than can be made up with the present shims offered.

If the counterbore ledge machining is repeated, recheck the seating area for cracking, using Crack Detection Kit, Part Number 3375432, or equivalent. If cracks are still present, the cylinder block will need to be replaced.

Install a hardened bronze shim, Part Number 3924445, 3924446, 3924447, 3924448, or 3924449, into the cylinder that was cut. Do **not** stack shims.

Install a new cylinder liner into the cylinder that was cut. Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)



Liner protrusion needs to be checked and verified. Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)

PARTS

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.

- Install the piston and connecting rod assemblies. Refer to Procedure 001-054 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-054.html)
- Install the piston cooling nozzles. Refer to Procedure 001-046 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-046.html)
- Install the block stiffener plate. Refer to Procedure 001-089 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-089.html)
- Install the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)
- Install the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Install the cylinder head. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Fill the engine with lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Select Service Tools

Recommended Cummins® Service Tools

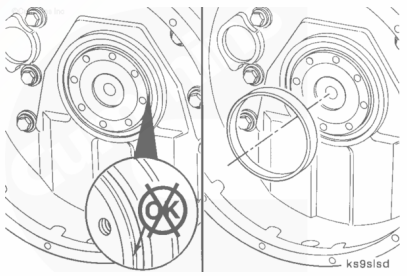
- Rear seal/sleeve installer, Part Number 3824078

Additional Service Items

- Dull chisel
- Hammer
- Crocus cloth
- Loctite® 262 or 271

Initial Check

If the crankshaft seal has worn a groove in the crankshaft flange, a wear sleeve **must** be installed to prevent oil leakage.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- If equipped with a wet flywheel housing, drain the oil from the flywheel housing by removing the plug in the bottom of the flywheel housing.
- Remove the starting motor. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)

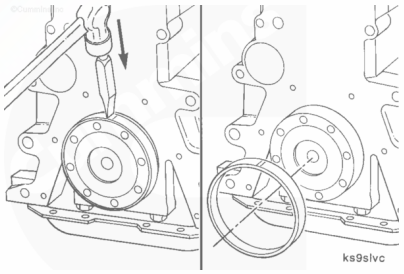
ANADOLU ISUZU AFTER SALES

- Remove the transmission and all related components, if equipped. See equipment manufacturer service information.
- Remove the flywheel. Refer to Procedure 016-005 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-005.html)
- Remove the flexplate. Refer to Procedure 016-004 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-004.html)
- Remove any components attached by the original equipment manufacturer (OEM) to the flywheel housing (e.g., mufflers, shift mechanisms, air filters, and so forth). See equipment manufacturer service information.
- Remove the flywheel housing. Refer to Procedure 016-006 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-006.html)
- Loosen the lubricating oil pan mounting capscrews four revolutions.
- Remove the crankshaft seal carrier and rear seal. Refer to Procedure 001-104 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-104.html)

Remove

⚠ CAUTION ⚠

Do not nick or gouge the crankshaft with the chisel. If the crankshaft is damaged, it must be replaced.



Note : This step is **only** if a wear sleeve was previously installed.

Use a dull chisel **only** as wide as the wear sleeve.

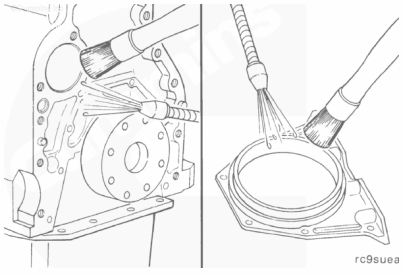
Make one or two soft blows with a hammer to make chisel marks across the wear sleeve. This will expand the wear sleeve allowing the sleeve to be removed.

Clean and Inspect for Reuse

Clean the gasket surface of the cylinder block and rear cover.

Remove any rust or other deposits from the crankshaft flange. Use a crocus cloth.

Clean the crankshaft flange. Use a clean cloth.



Inspect the crankshaft flange for dirt or nicks.

Inspect the rear cover for cracks or other damage.

Install

Note : The oil seal **must** be installed with the lip of the oil seal and crankshaft clean and dry to make sure of proper oil sealing.

Clean any lubricant from the lip of the oil seal and crankshaft.

The combination crankshaft oil seal (A) wear sleeve (B) replacement kit for service usage is installed on the crankshaft as an assembly. The crankshaft rear oil seal should **not** be removed from the crankshaft rear seal wear sleeve.

Note : If the oil pan is installed, loosen the oil pan capscrews to allow clearance for rear cover and gasket clearance.

Note : Use the following procedure if the oil pan gasket was damaged during removal of the rear seal carrier and for the techique to replace the oil pan gasket. Refer to Procedure 001-104 in Ssection 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-104.html)

Install the rear crankshaft seal carrier and gasket. Apply Loctite® 262 or 271. Loosely tighten the rear seal carrier mounting capscrews at this time.

The seal installation is being used to properly align the rear cover. Do **not** push or force the cover in any direction to prevent irregular seal lip position after seal installation.

The oil seal for the flywheel housing requires mild soap solution on the outside diameter of the seal case.

Install oil seal/wear sleeve assembly. Use rear seal/sleeve installer, Part Number 3824078. Install two (2) threaded studs into the crankshaft capscrew holes.

Apply a small amount of clean engine oil to the crankshaft, threaded studs, and inside diameter of the crankshaft rear seal/wear sleeve installation tool.

Position the chamfered end of the wear sleeve (A) onto the end of the crankshaft (B).

Position the counterbore end of installation tool (C) over threaded studs and align with wear sleeve, perpendicular to the end of the crankshaft.

Install the washers (D) and nuts (E) onto the threaded studs.

Alternately tighten the nuts until the installation tool contacts the end of the crankshaft.

Do **not** exceed ½ revolution on each nut to prevent wear sleeve binding and irregular stretch.

Torque Value: 20 n•m [180 in-lb]

Remove the installation tool and threaded studs.

Align the rear cover even with both sides of the oil pan rail on the cylinder block.

Tighten the rear carrier capscrews.

Torque Value: 13 n•m [115 in-lb]

Install the four (4) rear oil pan mounting capscrews to the pan.

Tighten the oil pan capscrews. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the flywheel housing. Refer to Procedure 016-006 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-006.html)
- Install the flexplate. Refer to Procedure 016-004 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-004.html)
- Install the flywheel. Refer to Procedure 016-005 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-005.html)
- Install the starting motor. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
- Install the transmission and all related components, if equipped. See equipment manufacturer service information.
- If equipped with a wet flywheel housing, fill the flywheel housing with oil. See equipment manufacturer service information.
- If previously removed, install any components attached by the OEM to the flywheel housing (e.g., mufflers, shift mechanisms, air filters, and so forth.) to the flywheel housing. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Preparatory Steps

⚠ WARNING ⚠

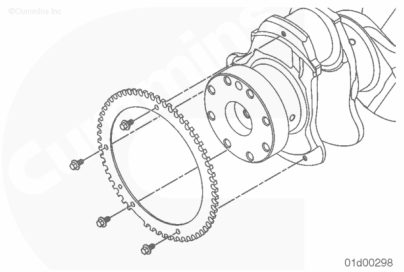
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the crankshaft. Refer to Procedure 001-016 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-016.html)

Remove

Note : The capscrews are one-time use **only**. They can **not** be used again.

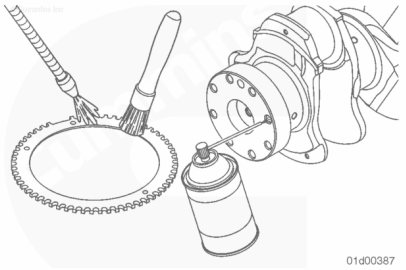
Remove and discard the four crankshaft speed indicator ring mounting capscrews.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

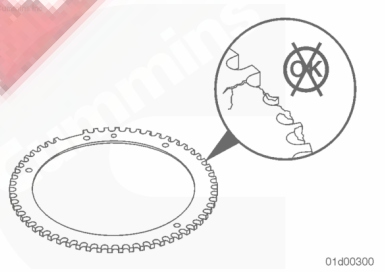
Clean any oil from the speed indicator ring.

Clean the capscrew holes in the crankshaft. Use degreaser solvent such as contact cleaner, Part Number 3824510.

Inspect the speed indicator ring for missing, bent, or damaged teeth.

Inspect for cracks or damaged surfaces.

If any visual damage is found, the speed indicator ring **must** be replaced.



Install

Install the speed indicator ring.

Install new capscrews.

Tighten the capscrews in an alternating pattern.

Torque Value: 8 n•m [71 in-lb]

General Information

The block stiffener plate will **only** be found on some engines.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)

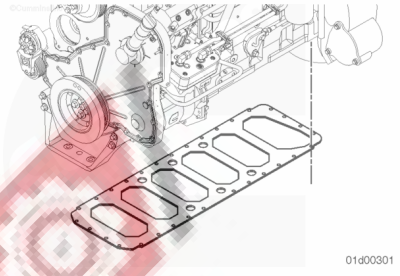
ANADOLU ISUZU GENUINE PARTS

- Remove the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Remove the lubricating oil suction tube. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)

Remove

Remove the block stiffener plate.

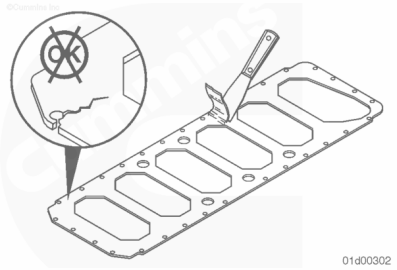
Note : The plate will be loose after the oil pan capscrews are removed.



Clean and Inspect for Reuse

Remove all gasket material from both gasket surfaces.

Inspect the block stiffener plate for cracks or other damage.



Install

Install the block stiffener plate. Use a new gasket and/or RTV sealant.

Note : The engines use a variety of combinations of gaskets and/or RTV sealant. When installing the oil pan and block stiffenter plate, use the same combination of gaskets and/or RTV sealant.

Note : The block stiffener **must** be held in place while the lubricating oil suction tube is installed. Use a few lubricating oil pan capscrews or wire ties to accomplish this.

Select Service Tools

Recommended Cummins® Service Tools

- Contact cleaner, Part Number 3824510, or equivalent

Additional Service Items

- No additional service items required.

Initial Check

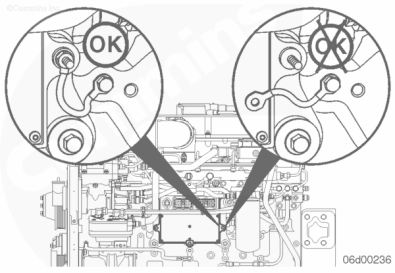
The engine control module (ECM) mounting plate assembly provides a vibration isolated mounting location for the ECM. The mounting plate also incorporates the fuel lift pump. A check valve at the outlet port in the ECM mounting plate makes sure the fuel system is primed while the fuel lift pump is running.

Check the ECM mounting plate for damaged vibration isolators, loose capscrews, or fuel leaks.

Make sure the ground strap is properly installed. A missing or poorly connected ground strap can cause intermittent engine performance problems.

The ground strap **must** be connected between the head of the ECM mounting bolt and the ECM.

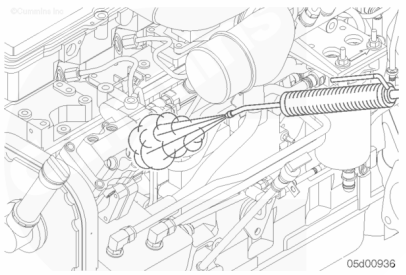
The ground strap **must** be connected to an unpainted block surface free of corrosion.



Preparatory Steps

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce

the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

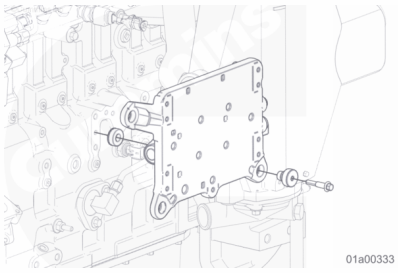
- Disconnect the batteries. See equipment manufacturer service information.
- Shut off the fuel supply and drain valves. See equipment manufacturer service information.
- Disconnect the rail fuel pressure sensor from the engine wiring harness. Refer to Procedure 019-115 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-115.html)
- Disconnect the ECM ground strap.
- Disconnect the engine harness from the electric priming pump.
- Disconnect the fuel supply lines. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Remove the ECM from the ECM mounting plate. Refer to Procedure 019-031 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-031.html)

ANADOLU ISUZU GENUINE SALES

Remove

Note : The electric fuel priming pump and priming pump fuel lines will be attached to the ECM mounting plate while the mounting plate is being removed.

Remove the ECM mounting plate capscrews and ECM mounting plate from the engine block.



Disassemble

Remove the following components from the ECM mounting plate:

- Male banjo quick disconnect fitting
- Male banjo check valve fitting
- Fuel lift pump supply lines
- Fuel lift pump brackets
- Fuel lift pump.

Inspect for Reuse

Inspect the ECM mounting plate for leaks.

Replace any damaged vibration isolators.

Inspect for leaks in the electric fuel supply pump priming circuit. Look for cracked fuel tubes, damaged o-rings, or damaged seal washers.

Inspect the check valve for debris or damage.

Assemble

Install the electric fuel priming pump and priming circuit fuel lines. Refer to Procedure 005-045 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-045.html)

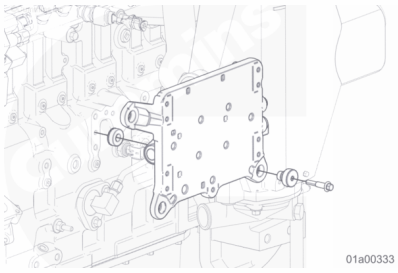
Make sure the lines are supported while tightening the banjo screws. The lines **must not** be permitted to bind.

Be sure the ECM check valve is installed into the bottom (outlet) fitting of the ECM mounting plate.

Install

Install the ECM mounting plate assembly on the engine block. Tighten the capscrews.

Torque Value: 24 n•m [212 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

Failure to properly install the ECM ground strap can cause intermittent engine symptoms including intermittent engine stalls. One end of the ground strap must be installed between the ECM housing and the head of the bottom most ECM mounting capscrew. The other end of the ground strap must be tightly bolted to an unpainted block surface free from corrosion.

Note : Make sure the vibrations isolators are installed correctly. The isolators fit in a single direction into the chamfered locators.

- Install the ECM on the ECM mounting plate. Refer to Procedure 019-031 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-031.html)
- Install the suction fuel lines, if removed.
- Connect the fuel supply lines. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Connect the engine harness to the electric fuel priming pump.
- Connect the ECM ground strap.
- Connect the harness connections to the ECM.
- Connect the batteries. See equipment manufacturer service information.
- Open the fuel supply valves, if equipped.
- Cycle the keyswitch. Allow the lift pump to operate for 30 seconds. Afterward, turn the keyswitch OFF and back ON again allowing the lift pump to operate again.
- Allow the lift pump to operate for three or four 30-second cycles before attempting to start the engine.
- Operate the engine. Check for leaks.

Last Modified: 25-Jul-2016

Select Service Tools

Recommended Cummins® Service Tools

- Abrasive pad, Part Number 3823258, or equivalent
- Sealant, Part Number 3164067, or equivalent
- Sealant, Part Number 3164070, or equivalent
- Guide, Centering, Part Number 5395409

Additional Service Items

- Feeler gauge or shim stock
- Fine crocus cloth
- Loctite™ 262 or 271
- Plastic hammer

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.

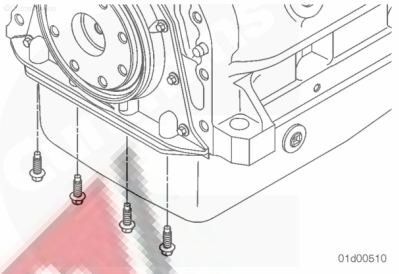
- Disconnect the batteries. See equipment manufacturer service information.
- If equipped with a wet flywheel housing, drain the oil from the flywheel housing by removing the plug in the bottom of the flywheel housing.
- Remove the starting motor. Reference Procedure 013-020 in Section 13.
- Remove the transmission and all related components, if equipped. See equipment manufacturer service information.
- Remove the flywheel, if equipped. Reference Procedure 016-005 in Section 16.
- Remove the flexplate, if equipped. Reference Procedure 016-04 in Section 16.
- Remove any components attached by the original equipment manufacturer (OEM) to the flywheel housing, such as mufflers, shift mechanisms, air filters, and so on. See

equipment manufacturer service information.
- Remove the flywheel housing. Reference Procedure 016-006 in Section 16.

Remove

⚠ CAUTION ⚠

Use extreme care when releasing the lubricating oil pan gasket from the rear cover to prevent damage to the gasket.



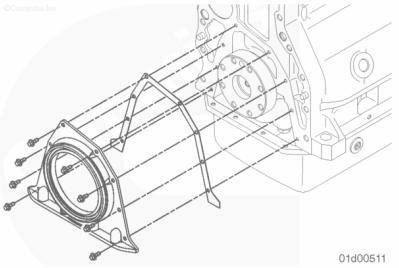
Remove the four lubricating oil pan mounting capscrews that secure the oil pan to the rear cover.

Insert the feeler gauge or shim stock between the rear cover and the oil pan gasket.

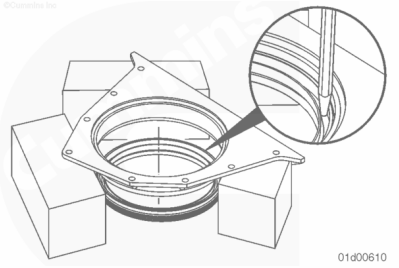
Move the feeler gauge back and forth to release the gasket from the rear cover.

Remove the capscrews from the rear cover.

Remove the cover from the crankshaft flange



Support the rear seal carrier on a flat work surface with wooden blocks. Use a suitable punch and hammer to drive the old seal out of the rear seal carrier.

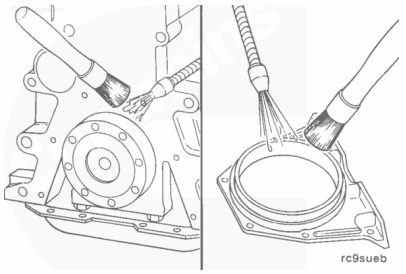


Clean and Inspect for Reuse

⚠ WARNING ⚠

ANADOLU ISUZU AFTER SALES

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



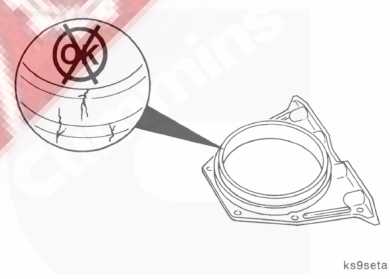
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the gasket surface of the cylinder block and rear seal carrier with solvent.

Dry these areas with compressed air.

Inspect the rear seal carrier for cracks or other damage. Replace the rear seal carrier if any damage is found.



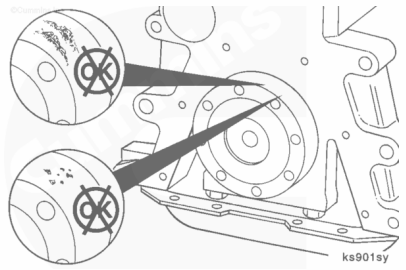
Use a fine crocus cloth to remove any rust or other deposits from the crankshaft flange.

Use a clean cloth and solvent to clean the crankshaft flange.

Inspect the crankshaft flange for nicks or burrs. Use an abrasive pad, Part Number 3823258 or equivalent, to remove any minor damage.

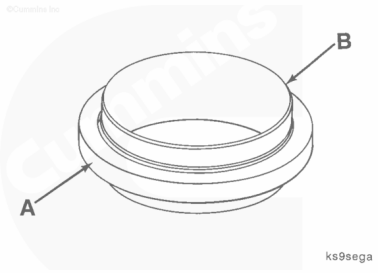
Note : If the cranksahft has excessive wear, a service wear sleeve is available.

For engines equipped with a lip style rear crankshaft seal, inspect the crankshaft seal contact area for a wear groove. If the groove is deeper than 0.25 mm [0.010 in], a wear sleeve and oversize seal **must** be used. Reference Procedure 001-067 in Section 1.



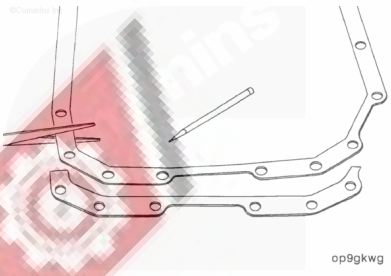
Install

Note : For engines equipped with a wet flywheel housing, make sure to replace the rear crankshaft seal with the correct rear seal. Rear crankshaft seals for wet and dry flywheel housings may **not** be the same.



The new rear crankshaft seal (A) will come installed on a seal pilot (B). The seal **must** be left on the seal pilot while installing the seal onto the nose of the crankshaft. This will keep the lips of the seal from being damaged during installation.

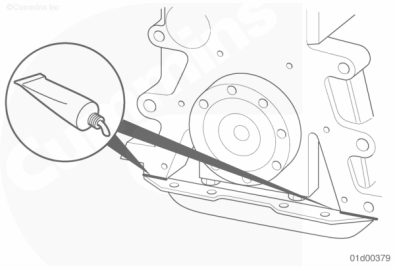
Service Tip:



If the oil pan gasket was damaged during removal of the real seal carrier, remove the damaged gasket and:

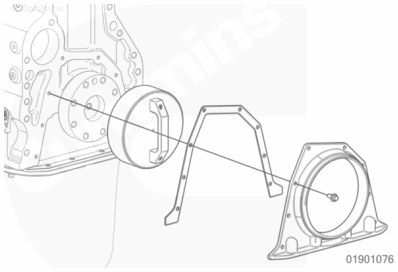
- If previously equipped with a paper oil pan gasket, use the old gasket as a pattern and cut a section of new gasket to the same size. Use a light coat of sealant, Part Number 3164067, or equivalent, to hold the gasket in place.
- If previously equipped with a sealant **only** oil pan gasket, apply a bead of sealant, Part Number 3164070, or equivalent, to the oil pan flange.
- If previously equipped with a suspended oil pan, the oil pan **must** be removed and a new gasket installed. Reference Procedure 007-025 in Section 7.

Note : It can be necessary to trim the rear seal carrier gasket so it is even with the oil pan mounting surface. Test fit the gasket prior to installing.



Apply a thin bead of sealant, Part Number 3164067, or equivalent, at the intersecting joint of the oil pan and cylinder block prior to installing the rear crankshaft seal carrier. The rear crankshaft seal carrier **must** be installed within 10 minutes of applying the sealant.

Install the crankshaft seal carrier using the centering guide, Part Number 5395409.



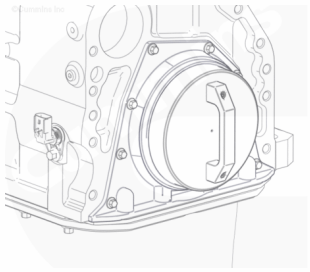
Use the centering guide tool to align the crankshaft seal carrier by using the end of the crankshaft as the pilot.

Install the rear crankshaft seal carrier and gasket. Apply Loctite® 262 or 271 to the mounting capscrews.

Loosely tighten the rear seal carrier to the block.

⚠ CAUTION ⚠

Do not push or force the cover in any direction. This can cause an irregular seal lip position after seal installation. An engine oil leak will result.

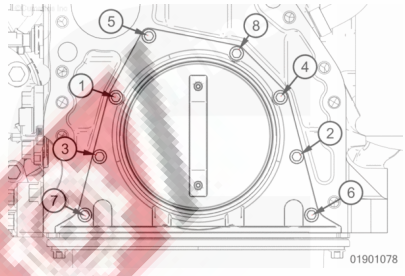


Align the rear cover even with both sides of the oil pan rail on the cylinder block.

Tighten the rear cover capscrews.

The chart below shows the proper torque value when using a 9.8 or a 10 9 grade bolt. The grade is embossed on the top of each bolt.

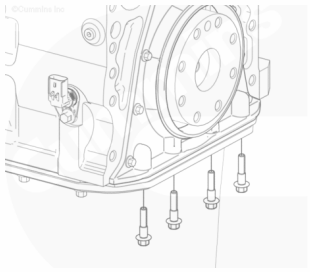
Apply Loctite® 262 or 271 to both part numbers below during installation.



Rear Seal Carrier				
Bolt Number	**Bolt Size**	**Bolt Class**	**Torque**	**Loctite®**
3913638	M-6	9.8	10 N•m [89 in-lb]	Yes
3991306	M-6	10.9	13 N•m [115 in-lb]	Yes

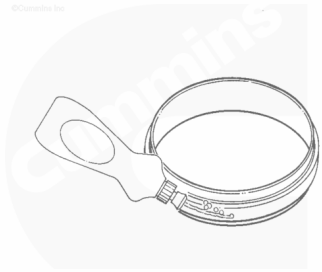
Install the four rear lubricating oil pan mounting capscrews into the rear cover.

Torque Value: 28 n•m [248 in-lb]

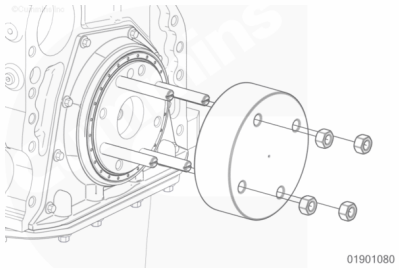


Remove the centering tool.

To aid in installation, the lubricating oil lip seal requires the application of a mild soap or P-80, Part Number 3824878, on the outside diameter of the seal.



Place the new rear crankshaft seal, with tapered end of the crankshaft seal pilot over the crankshaft nose, and slide it by hand toward the crankshaft seal carrier.



Remove the crankshaft seal pilot.

Use Rear Crankshaft Seal Installation Kit, Part Number 5395259, to install the rear crankshaft seal. Refer to Procedure 001-024 in Section 1. (/qs3/pubsys2/xml/en/procedures/100/100-001-024.html)

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the flywheel, if equiped. Reference Procedure 016-005 in Section 16.
- Install the flexplate, if equipped. Reference Procedure 016-04 in Section 16.
- Install the starting motor. Reference Procedure 013-020 in Section 13.
- Install the transmission and all related components, if equipped. See equipment manufacturer service information.
- If equipped with a wet flywheel housing, fill the flywheel housing with oil. See equipment manufacturer service information.
- If previously removed, install any components attached by the OEM to the flywheel housing, such as mufflers, shift mechanisms, air filters, and so on. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for proper operation.

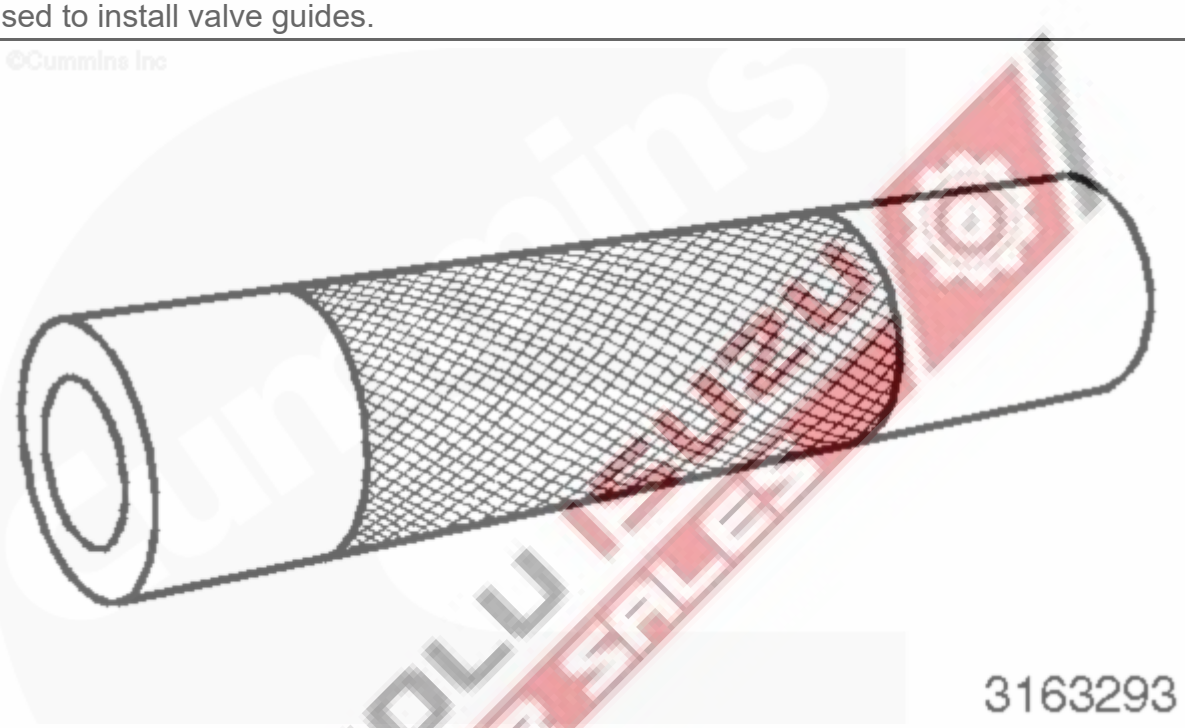
Cylinder Head

Tool Number

3163100

Valve Guide Installer

Used to install valve guides.

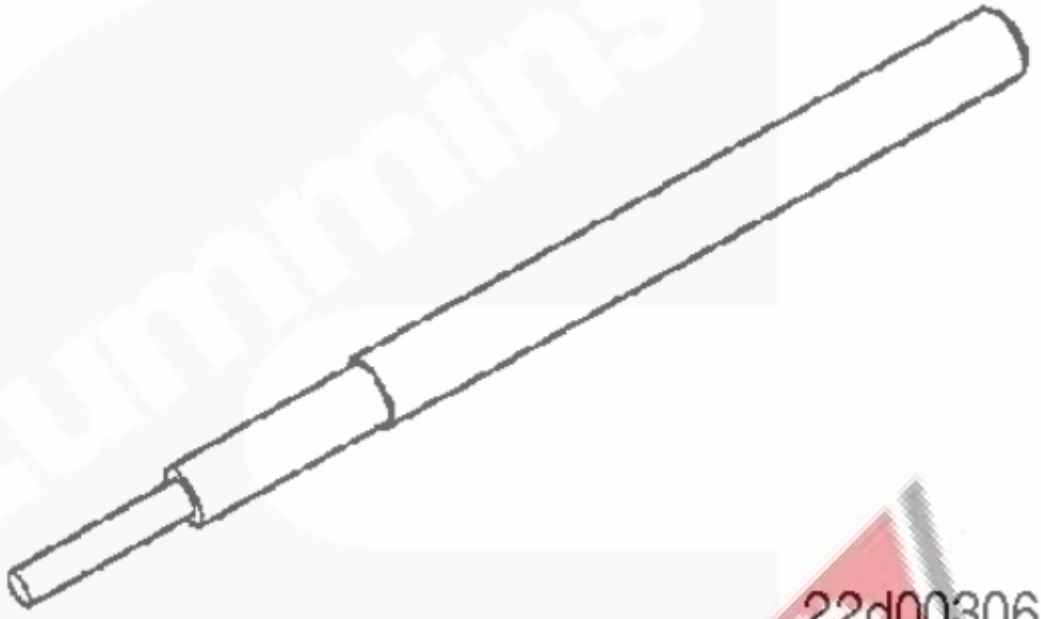


Tool Number

3163101

Valve Guide Remover

Used to remove valve guides.

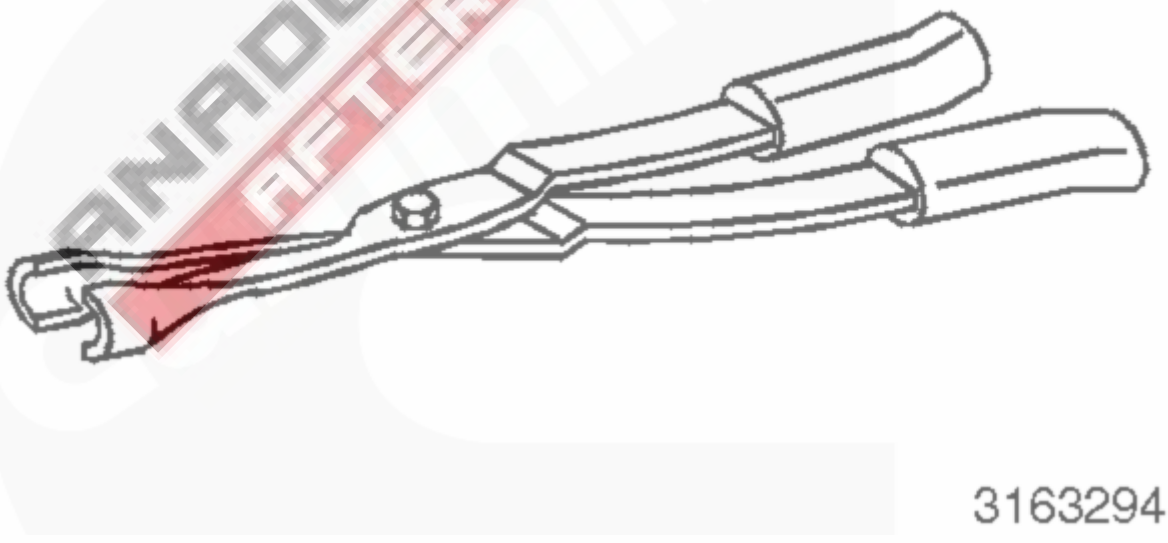


Tool Number

3163293

Boot Pliers

Used to remove valve stem seals. The twist and pull action frees the boot and the serrated jaws provide a secure grip.

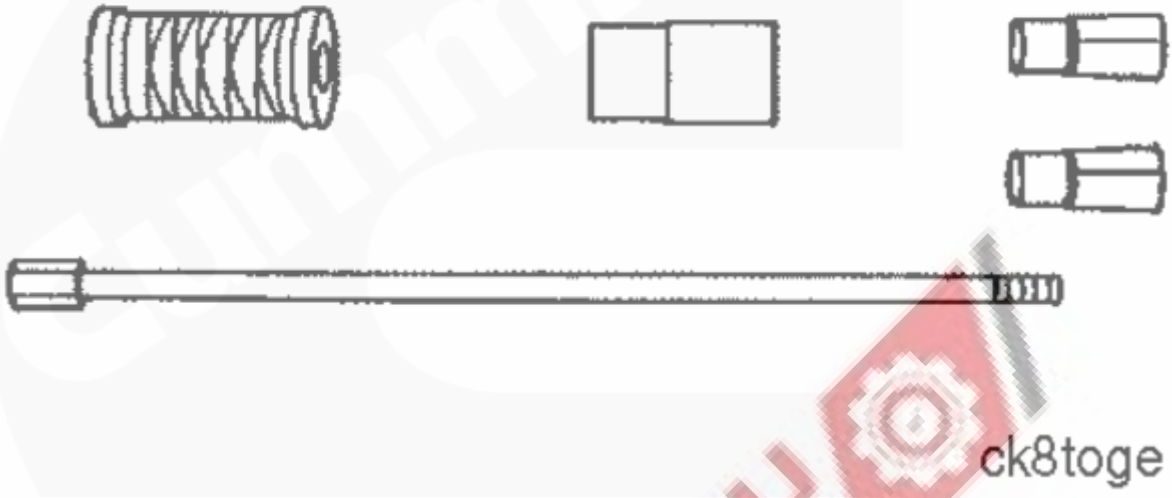


Tool Number

3163720

Dowel Pin Extractor

This puller contains various sized collets to remove crosshead guides or dowels throughout the engine.



Tool Number

3164087

Assembly Lubricant

This is a multi purpose anti-seize lubricant. This is an all purpose anti-seize lubricant that speeds assembly and disassembly of studs, bolts, capscrews, flanges and fittings.

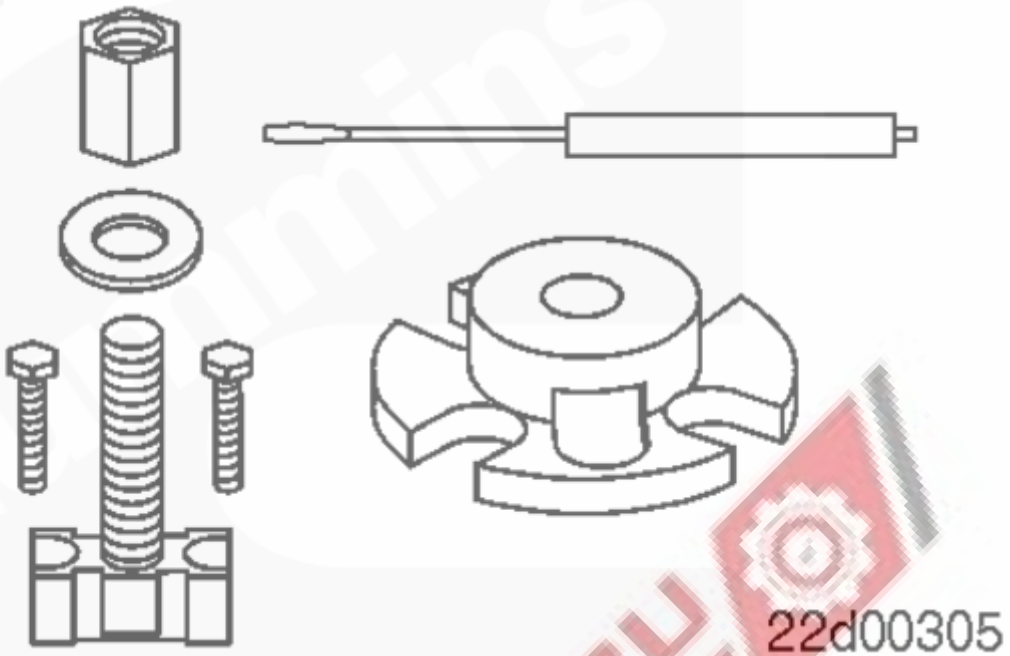
SP000786

Tool Number

3164329

Valve Spring Compressor

Used to remove and install valve collets.

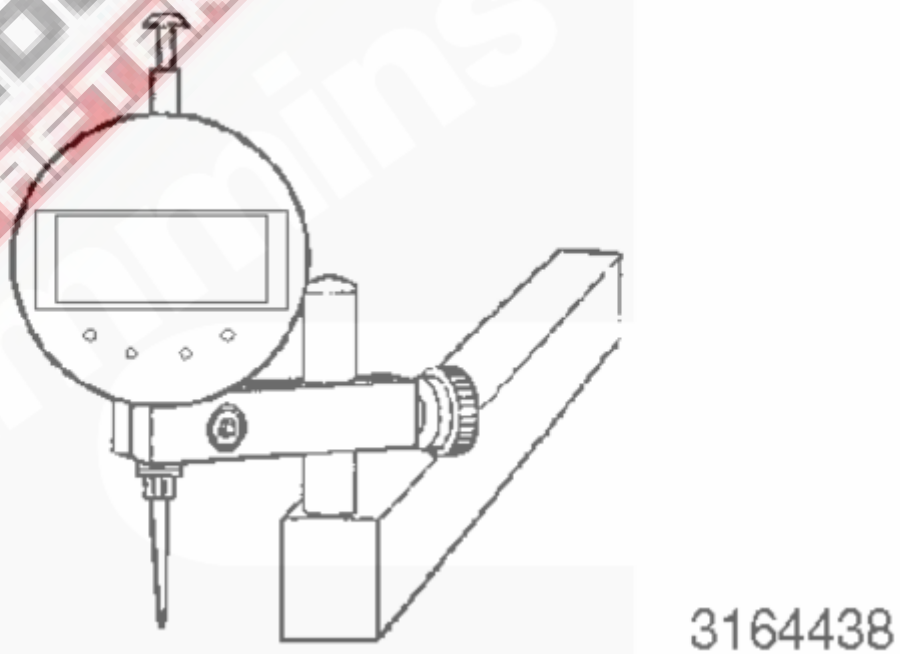


Tool Number

3164438

Depth Gauge Assembly

Used to measure injector protrusion and valve intrusion and/or protrusion. Equipped with electronic digital indicator.



Tool Number

3165113

Intake Valve Seat Extractor Collet

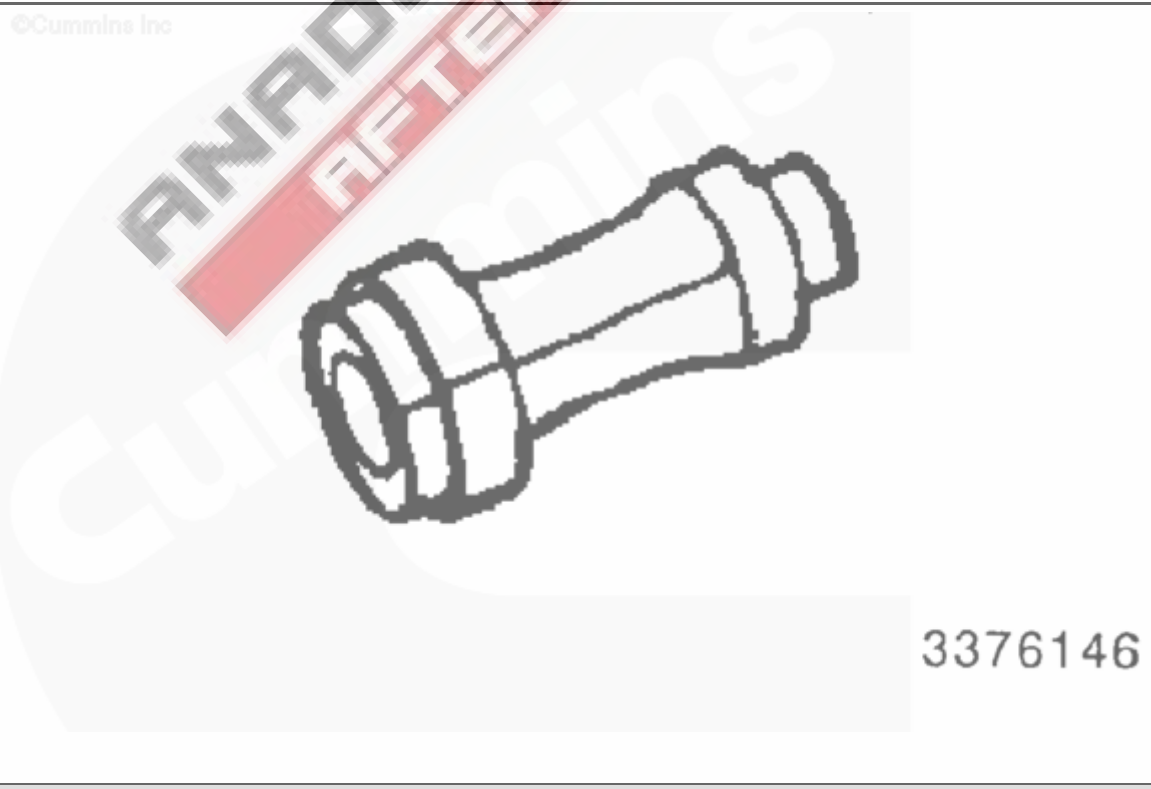
Used with slide hammer, Part Number 3376617. The slide hammer is sold separately.

Tool Number

3165114

Exhaust Valve Seat Extractor Collet

Used with slide hammer, Part Number 3376617. The slide hammer is sold separately.



Tool Number

3165115

Valve Seat Installer

Used for installing intake and exhaust valve seats.

Tool Number

3375182

Valve Spring Tester

Used to check spring tension.

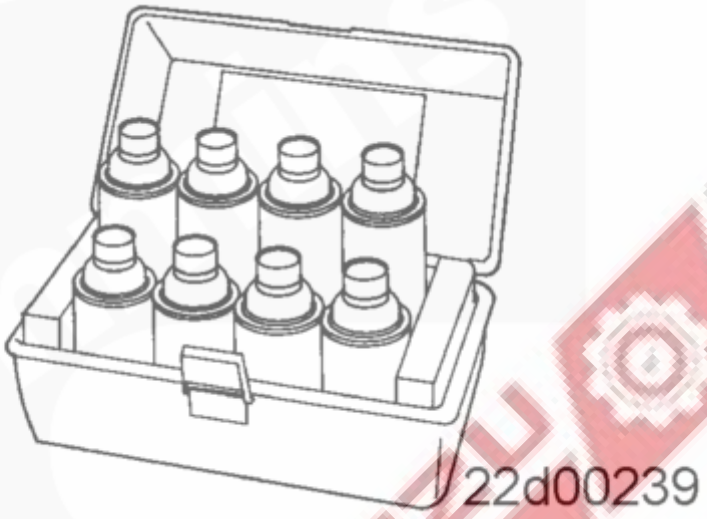
ANADOLU ISUZU AFTER SALES

Tool Number

3375432

Crack Detection Kit (Dye Type)

Used to clean and inspect components for cracks.



Tool Number

3375805

Valve Lapping Compound

An abrasive compound used to lap the valves.

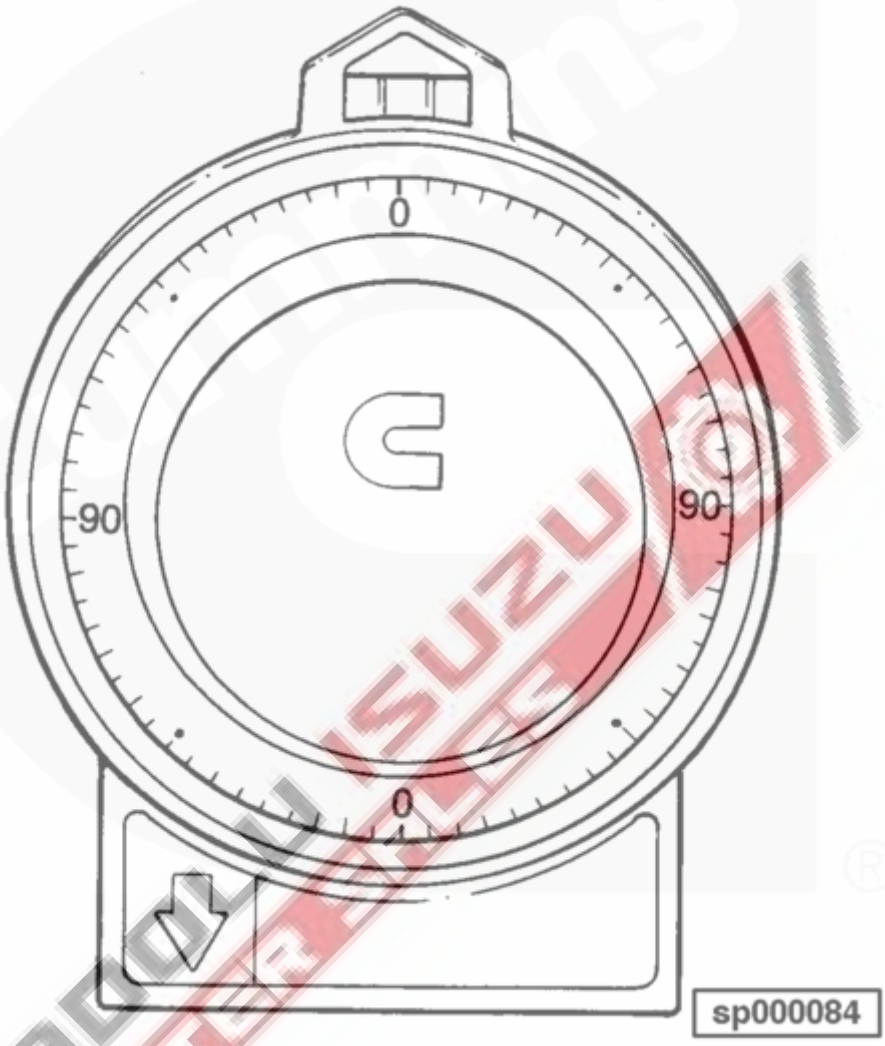
Tool Number

©Cummins Inc
ANADOLU ISUZU AFTER SALES

3375855

Angle Level Indicator

This angle indicator is used to set and/or adjust the fuel pump throttle lever angle. It can also be used to set a remote governor throttle lever angle or check drive line angles etc.

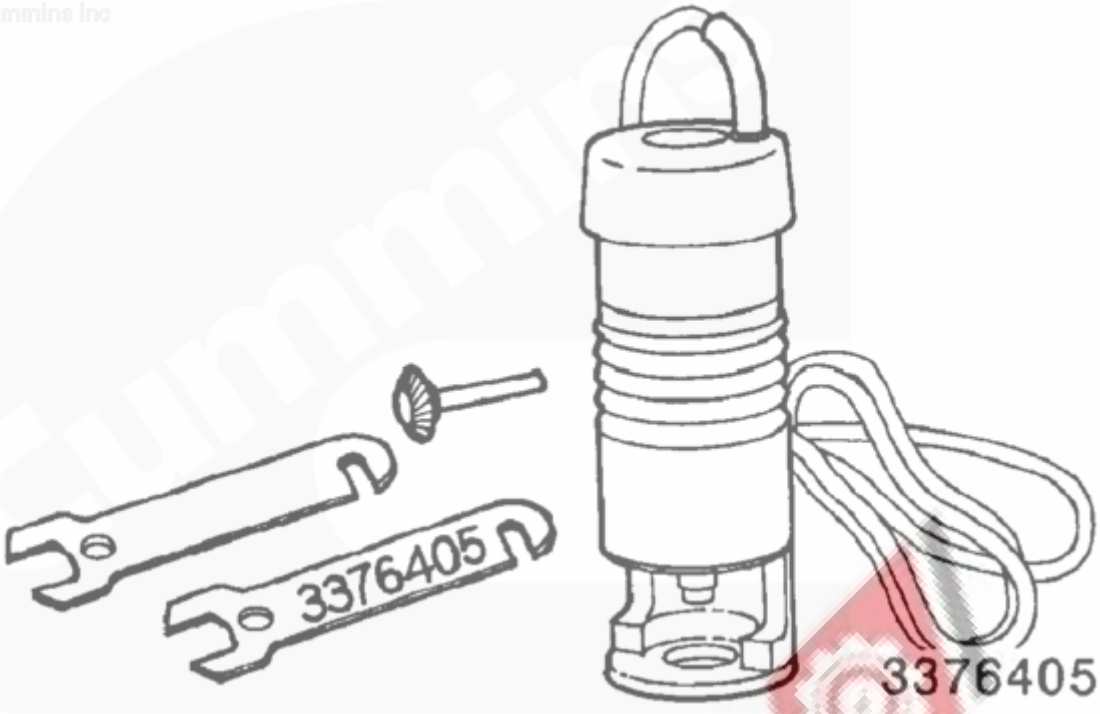


Tool Number

3376405

Valve Seat Grooving Tool

Used to cut a groove in the valve seat. This is often required prior to use of the valve seat extractor. It requires cutter bit, Part Number 3376407. The cutter bit is sold separately.

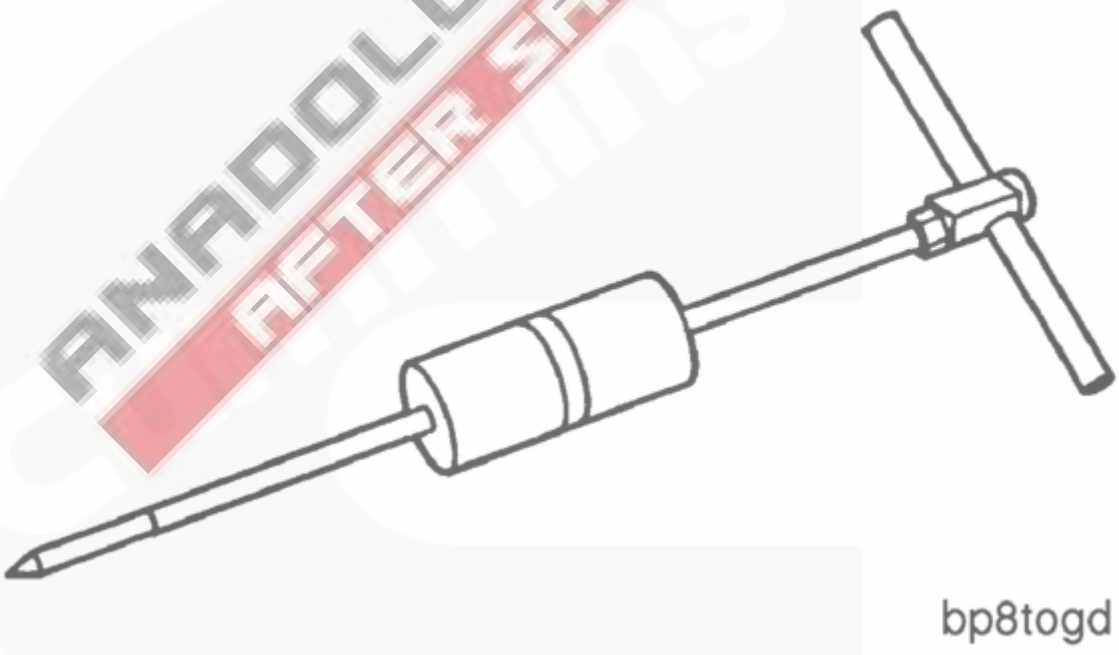


Tool Number

3376617

Slide Hammer Assembly

Used with the valve seat extractor to remove the valve seat inserts from the cylinder head.

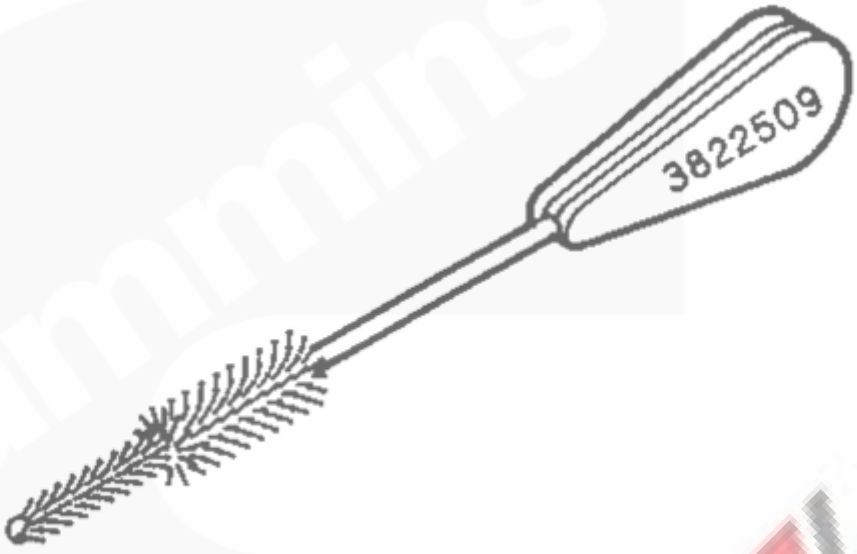


Tool Number

3822509

Injector Bore Brush

Used to clean carbon from injector bores.



3822509

Tool Number

3823258

Abrasive Pad

Used to clean carbon from the upper liner bores, remove rust and corrosion, and scuff surfaces.

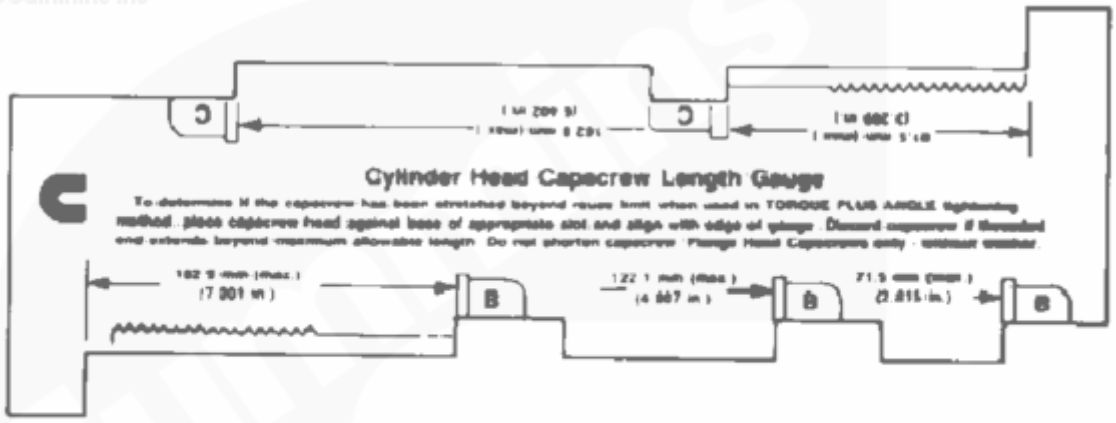
22900039

Tool Number

3823921

Capscrew Length Gauge

Used to measure capscrew free length.

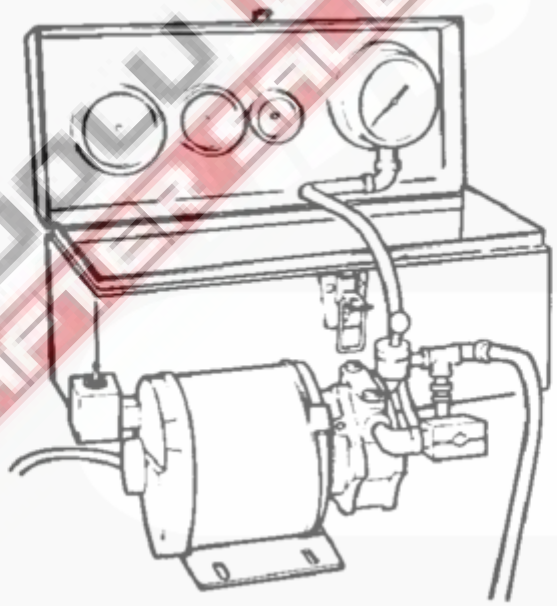


Tool Number

3824277

Valve Vacuum Tester (115 VAC 50/60 Hz)

Used with vacuum cup, Part Number ST 1257 6, to vacuum test the cylinder head, to determine if the valves are properly seated.



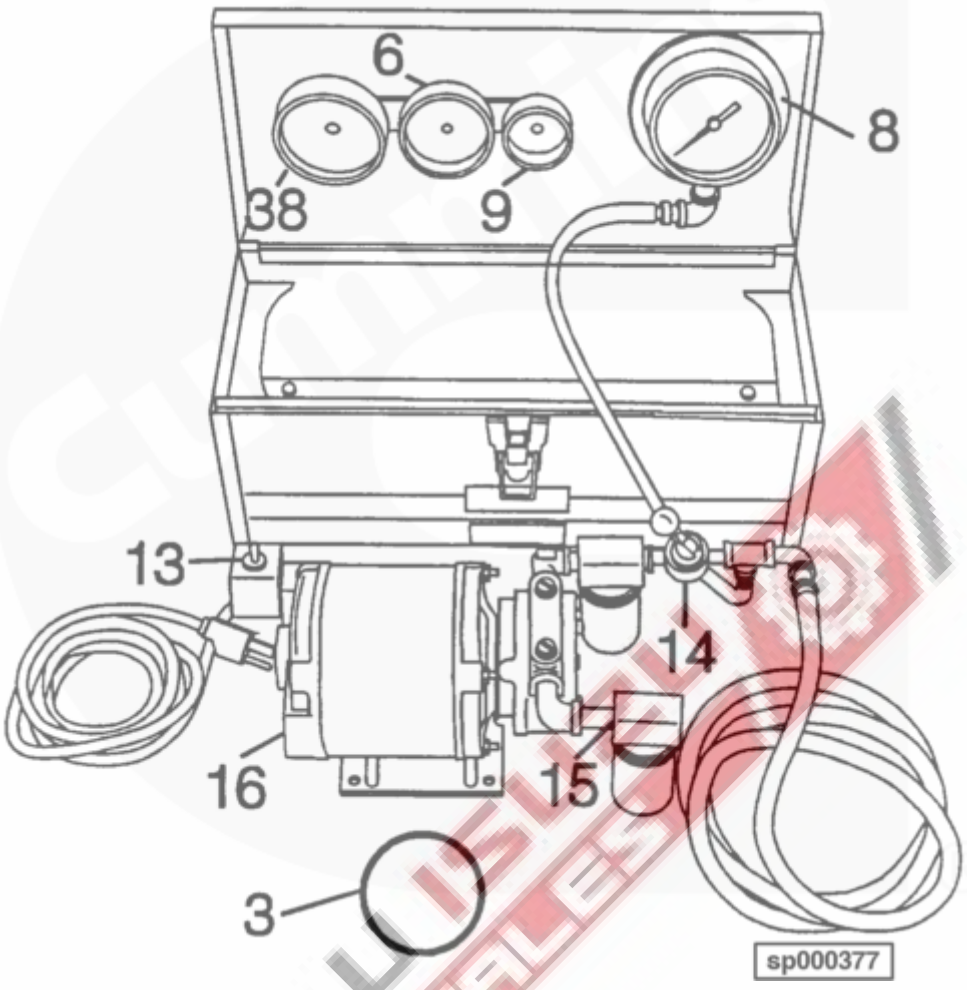
Tool Number

3824278

Valve Vacuum Tester (230 VAC 50/60 Hz)

This valve vacuum tester provides all the necessary vacuum cups and seals to determine if

valves are properly seated in the cylinder head using vacuum to provide a positive test. Above kits do not include cups and seals for B and C Series.



Tool Number

3824510

Contact Cleaner

This is an alcohol based precision cleaner 100% free of CFC's. This product is ideal for application where lower flash-point solvents can be used. It evaporates rapidly and completely and is harmless to most plastics. Use this when cleaning electrical/electronics connections. (Flammable).

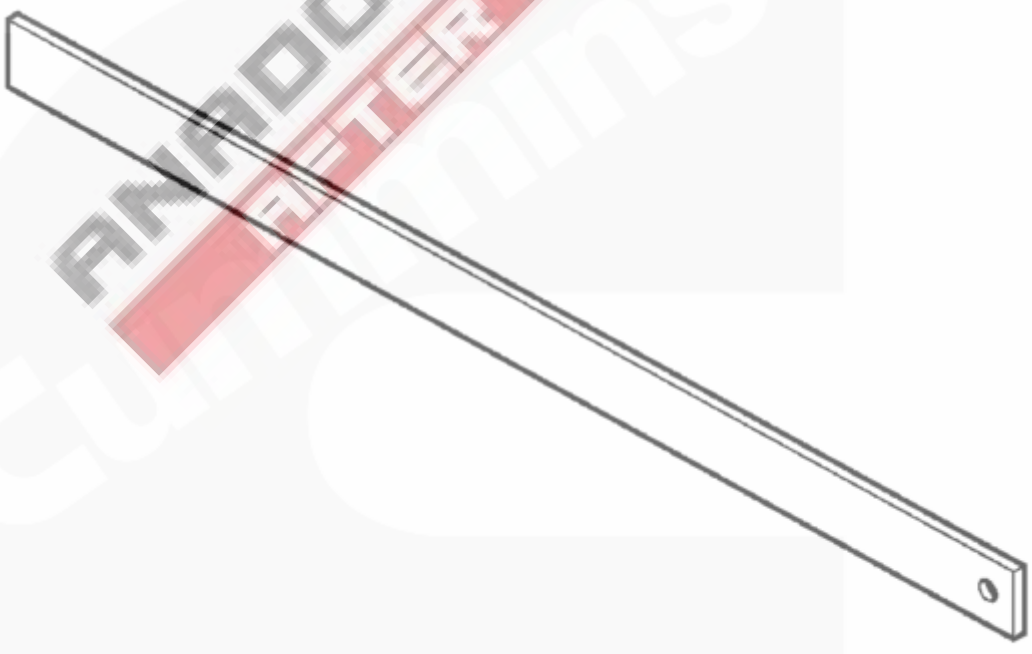
SP000784

Tool Number

4918219

Precision Straightedge

Used to check cylinder head combustion decks for flatness.



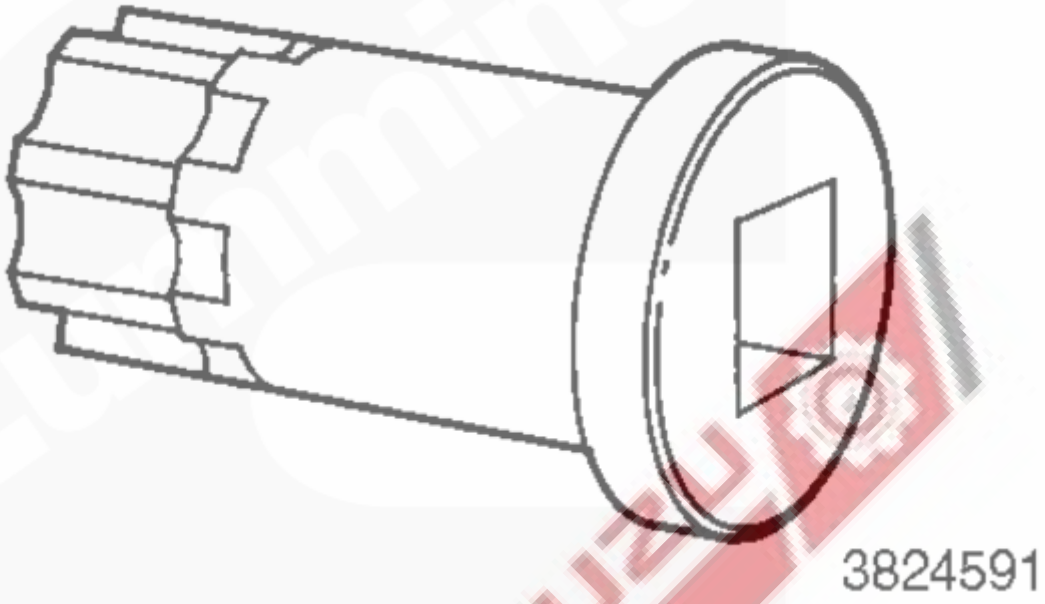
22d00222

Tool Number

5299073

Engine Barring Gear

Used to engage the flywheel ring gear to rotate the crankshaft.

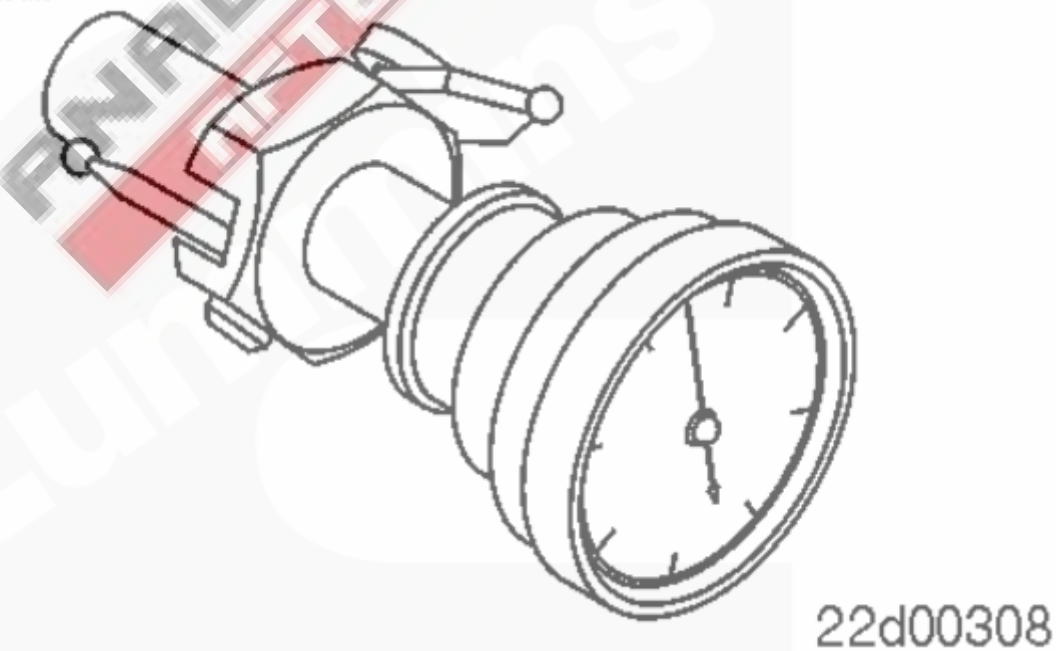


Tool Number

ST 685 4

Eccentrimeter Gauge

Used to measure the valve seat to valve guide runout.



Tool Number

ST 1166

Magnetic Crack Detector

Used to inspect the cylinder head combustion face for cracks in the injector bore and valve seat areas. The kit includes powder spray bulb, Part Number ST 1166 7, used for spraying metal powder, Part Number ST 1166 8.

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

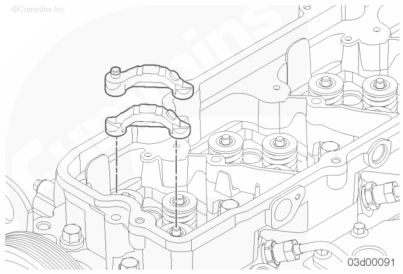
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Remove the exhaust gas recirculation (EGR) connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Remove the rocker lever assembly. Refer to Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)

Remove

Note : Make note of the crosshead location and orientation. If the crossheads are reused, they **must** be installed in their original location and orientation.

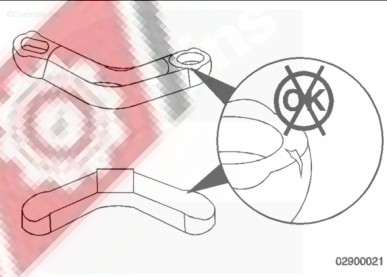
Remove the crossheads.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the crossheads. Use solvent. Dry with compressed air.

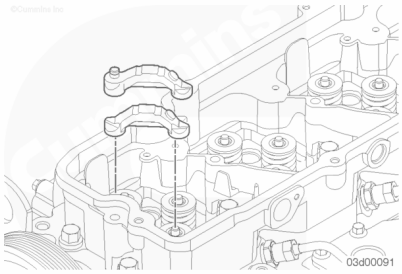
Inspect the crossheads for cracks and/or excessive wear on the rocker lever and valve tip mating surfaces.

Inspect the contact pads for cracks and other damage.

Install

Note : The crosshead has a round hole and an oval hole. If installing new crossheads, it is **not** required to place the holes in a particular position.

Note : When reusing the crossheads, make sure to install them in their original location and orientation.



Install the crossheads on the valve stems.

When installing the crossheads on engines equipped with engine brakes, the pin on the crosshead **must** be facing the exhaust manifold.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the rocker lever assembly. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Adjust the overhead. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)
- Install the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Install the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Install the EGR connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html).
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ CAUTION ⚠

If removing the cylinder head with the injectors installed, be careful not to damage the tips of the injector. Do not set the cylinder head down on the combustion face with the injectors installed. Damage to the injector tips will result.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the air crossover tube. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Remove the air intake connection adapter. Refer to Procedure 010-131 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-131.html)
- Remove the injector supply lines. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Remove the air intake manifold. Refer to Procedure 010-023 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-023.html)
- Remove the fuel rail. Refer to Procedure 006-060 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-060.html)
- Remove the fuel connection tubes. Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)
- Remove the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Remove the heat shield. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Remove the rocker lever housing. Refer to Procedure 003-013 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-013.html)
- Remove the rocker lever. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Remove the crossheads. Refer to Procedure 002-001 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-001.html)

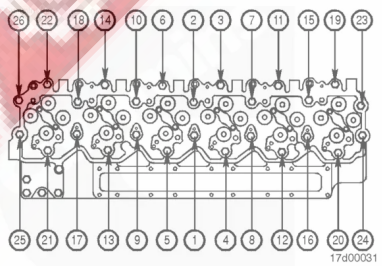
- Remove the push rods or tubes. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Remove the fuel drain lines. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Remove the turbocharger. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)
- Remove the exhaust manifold. Refer to Procedure 011-007 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-007.html)

Note : Do **not** remove the injectors at this time. Remove the cylinder head with the injectors installed so the injector protrusion can be checked.

Remove

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.

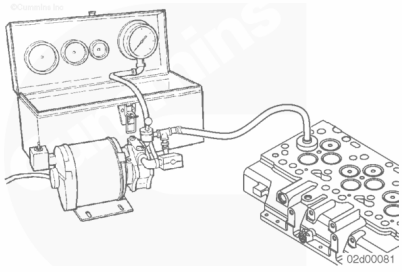


Remove the cylinder head capscrews.

Remove the cylinder head and gasket from the cylinder block.

Vacuum Test

Note : If a leaking valve is suspected, use valve vacuum tester, Part Number 4918803, and cup, Part Number 3376100, to vacuum test the valves and valve seats. The vacuum **must not** drop more than 254 mm-hg [10 in-hg] in 10 seconds.



Valve to Valve Seat Vacuum		
457 mm-hg	Used	18 in-hg
635 mm-hg	New	25 in-hg

Note : If a vacuum tester is **not** available, use a lead pencil or Dykem™ marking pen with the valve removed to mark across the valve face. Install the valve in the valve guide. Hold the valve against the valve seat. Rotate the valve backward and forward

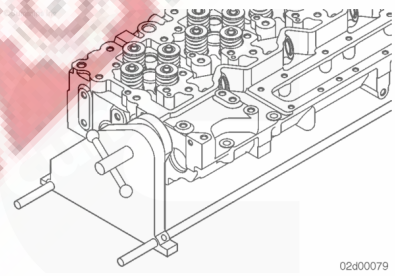
three or four times. Correct contact against the valve seat will break the marks on the valve face.

If out of specification, disassemble the cylinder head. Inspect for damaged valves and/or valve seat inserts. Repair as necessary:

1. Clean the valve, valve seat inserts, and lap the valves.
2. Replace the damaged valve/valve seat inserts, if available.
3. Replace the cylinder head.

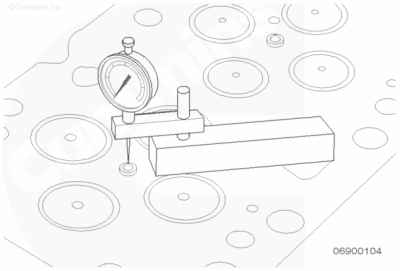
Disassemble

Install the cylinder head in cylinder head holding fixture, Part Number ST 583, or equivalent.



Before removing the injectors, use gauge block, Part Number 3164438, to measure the injector protrusion.

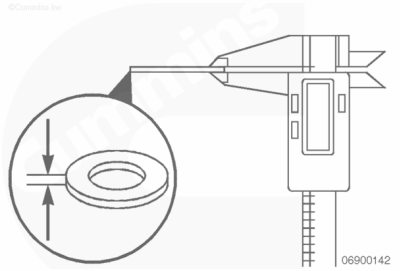
Place the injector protrusion tool on the flat surface of the head. Measure the injector protrusion to the highest point on the injector. The protrusion **must** be within the following specifications:



Injector Protrusion		
mm		in
2.25	MIN	0.088
2.80	MAX	0.110

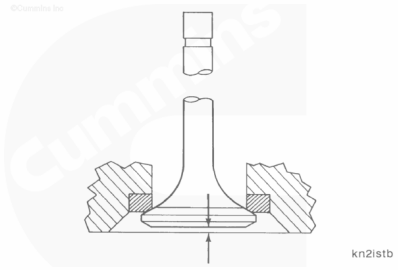
Remove the injector. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

If the injector protrusion is out of specification, check the thickness of the injector sealing washer. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)



If the sealing washer is the correct thickness, check to make sure the injector bore is clean and free of debris. Also make sure sealing washers are **not** "stacked" in the injector bore.

Standard Cylinder Head

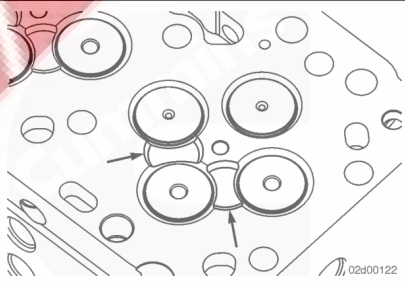


Measure the valve recess.

Standard Head Valve Recess in Cylinder Head		
mm		in
0.84	MIN	0.033
1.32	MAX	0.052

If the valve recess is outside the specifications, replace the valve. If the valve recess is still outside the specifications, the valve seat insert or cylinder head **must** be replaced.

Scallop Cylinder Head

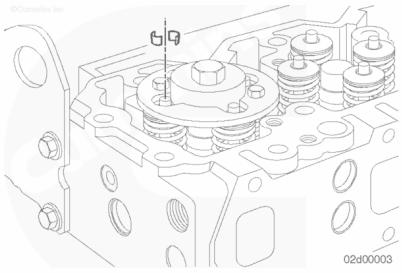


Measure the valve recess.

Scallop Head Valve Recess in Cylinder Head		
mm		in
0.69	MIN	0.027
1.17	MAX	0.046

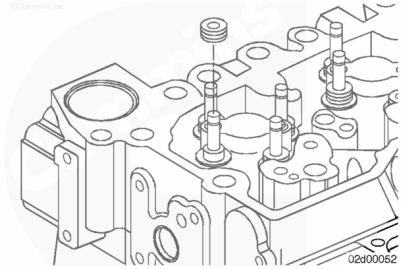
If the valve recess is outside of the specifications, replace the valve. If the valve recess is still outside the specifications, the valve seat insert or cylinder head **must** be replaced.

Compress the valve springs. Remove the valve stem collets. Use valve spring compressor, Part Number 3164329.



Release the valve springs. Remove the spring retainers and springs.

Use boot pliers, Part Number 3163293, or equivalent, to remove the valve stem seal.

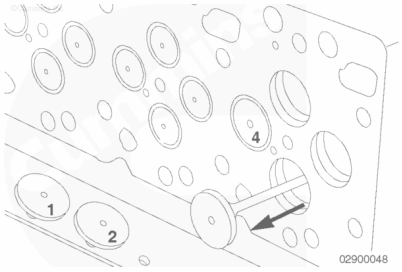


Remove and discard the valve stem seals.

Keep the valves in a labeled rack for a correct match with companion seats while making measurements.

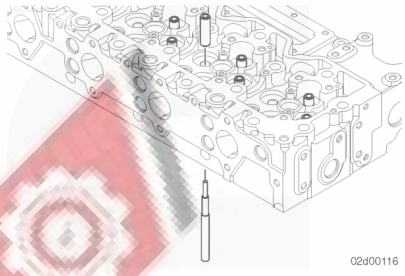
Mark the valves to identify their location. Any numbering system can be used as long as the valves are put back in their original location if they are to be reused.

Remove the valves.



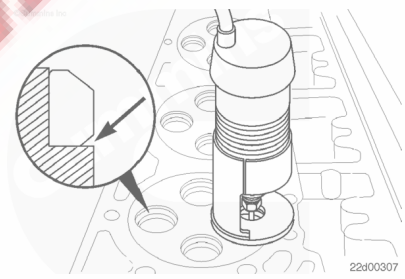
Note : Prior to removing the valve guide, see the Inspect for Reuse section in this procedure. The condition of the valve guide will help to determine if it needs to be replaced.

Use valve guide driver, Part Number 3163101, or equivalent, to remove the old valve guides.



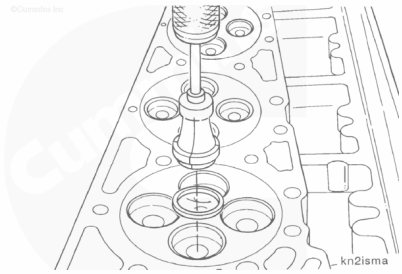
Note : Prior to the removal of the valve seat inserts, see the Clean and Inspect for Reuse section in this procedure. The condition of the valve, the amount of recess, and the sealing of the valve on the seat insert all help to determine if a valve seat insert needs to be replaced.

1. If required, remove the valve seat inserts.
2. Inspect the valve insert-to-cylinder head contact area. A sufficient groove for the remover **must** exist.
3. If there is sufficient valve seat insert groove area, proceed to the next step.
4. If the valve seat insert groove area is **not** sufficient, use Valve Seat Insert Cutting Kit, Part Number 3376405, or equivalent, to create a sufficient groove.



Use slide hammer remover, Part Number 3376617, with intake valve seat insert extractor, Part Number 3165113, and exhaust valve seat insert extractor, Part Number 3165114, to remove the valve seat inserts.

Note : Make certain the valve seat insert remover assembly is perpendicular to the cylinder head when installed. Place the valve seat insert remover assembly into the valve seat insert. Rotate the T-handle **clockwise** until the remover loosely grips the valve seat insert.



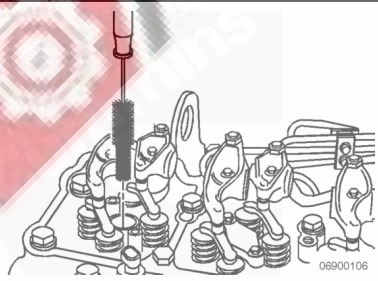
Position the valve seat insert remover assembly into the valve seat insert groove area. Tighten the T-handle firmly, allowing the remover to expand under the valve seat insert or into the cut groove.

Strike the slide hammer remover against the top nut until the valve seat insert is removed. Turn the T-handle **counterclockwise** to release the valve seat insert from the remover.

Clean and Inspect for Reuse

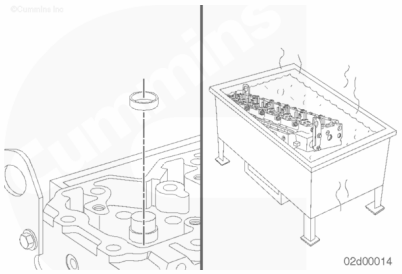
Use injector bore brush, Part Number 3822509, or equivalent, to clean the carbon from the injector nozzle seat.

Scrape the gasket material from all gasket surfaces on the block and head.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

To reduce the possibility of personal injury, wear goggles and protective clothing.

Clean the buildup of deposits from the coolant passages. Excessive deposits can be cleaned in an acid tank, but the expansion plugs **must** first be removed.

Clean the cylinder head combustion deck. Use abrasive pad, Part Number 3823258, or equivalent, and diesel fuel or solvent. The surface finish (RA - roughness average) maximum is 3.2 µm [0.0001 in].

Inspect the area within 1/8 inch of the firing ring diameter. Any wear that can be felt with a fingernail within the 1/8 inch area is unacceptable, making the cylinder head **not** reusable.

Wear beyond this 1/8 inch area will have no effect on future combustion sealing and the usability of the cylinder head.

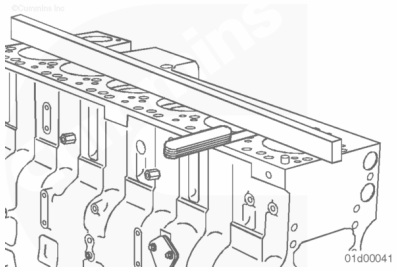
Clean carbon deposits from the valve pockets with a high quality steel wire wheel installed in a drill or a die grinder.

Note : An inferior quality wire wheel will lose steel bristles during operation, causing additional contamination.

Wash the cylinder head in a hot, soapy water solution.

Dry with compressed air.

Use straightedge, Part Number 4918219, or equivalent, and a feeler gauge to measure the overall flatness of the cylinder block.

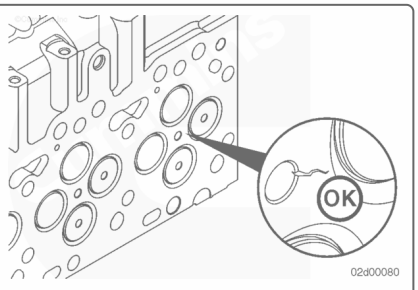


The overall flatness, end-to-end and side-to-side, **must not** exceed 0.075 mm [0.003 in].

Use a 2 foot straightedge and a 0.0254 mm [0.001 in] feeler gauge to measure local cylinder block combustion surfaces flatness. Check between the cylinder bores and also between the coolant passages. If the 0.0254 mm [0.001 in] feeler gauge fits under the 2 foot straightedge, or if the cylinder block is pitted, has grooves or other damage, the cylinder block **must** be replaced.

Cylinder Head Cracks - Reuse Guidelines

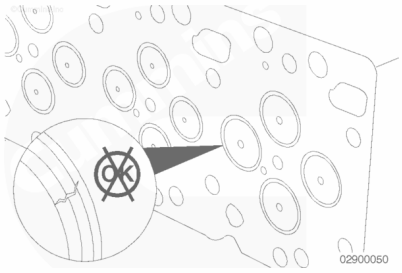
The reuse guidelines for a cylinder head with a crack extending from the injector bore to the intake valve seat are as follows:



- If a crack does **not** extend into the valve seat, the cylinder head is reusable.

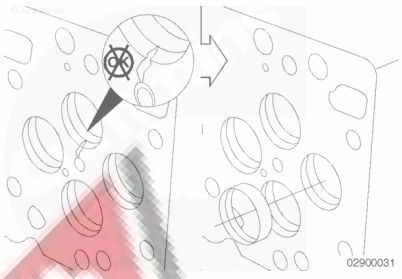
Inspect the valve seats for cracks or burn spots.

- If the valve seats are cracked or burned, the valve seat **must** be replaced.
- If the valve seat has dropped out and caused damage to the cylinder head combustion face, the cylinder head **must** be replaced.



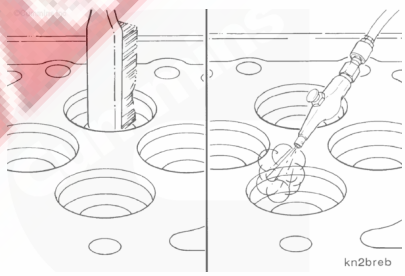
If a crack extends into or through the valve seat bore, the cylinder head **must** be replaced.

Use Crack Detection Kit, Part Number 3375432, or equivalent, to help identify cylinder head cracks.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

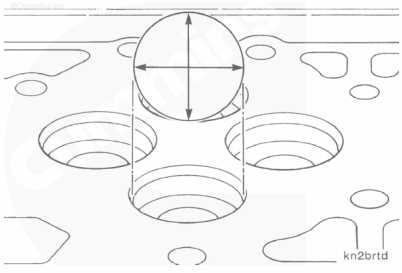
Wear appropriate eye and face protection when cleaning the valves. Flying debris and dirt can cause personal injury.

Use a wire brush and solvent to clean the deposits from the valve seat insert bores, if it was necessary to remove the valve seat inserts.

Dry with compressed air.

If the valve seat insert was removed in the Disassemble section, measure the inside diameter of the valve seat insert bore in the cylinder head.

Cylinder Head Insert Bore Inside Diameter (ID)		
mm		in
39.371	MIN	1.550
39.401	MAX	1.551



ANADOLU ISUZU PARTS

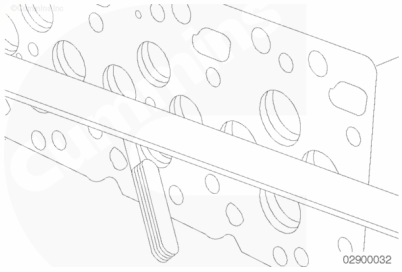
Note : Before cutting the cylinder head, verify the valve seat inserts are available for the engine being serviced. If none are available, the cylinder head **must** be replaced.

If out of specification, the valve seat insert bore can be oversized 0.254 mm [0.010 in].

Cylinder Head Insert Bore Inside Diameter (ID) for Oversized Seats		
mm		in
39.625	MIN	1.560
39.655	MAX	1.561

Note : It is very important to take precise measurements of the valve seat pocket diameter. A 4 point contact gauge is recommended for this measurement process. Failure to take proper diameter measurements will lead to a poor press fit of the valve seat, which can lead to a dropped valve seat and damage to the cylinder head combustion face.

Use straightedge, Part Number 4918219, and a feeler gauge to inspect the cylinder head combustion surface for flatness.



Cylinder Head Flatness				
	mm		in	
End-to-End		0.203	MAX	0.008
Side-to-Side		0.075	MAX	0.003

Use a 2 foot straightedge and a 0.0254 mm [0.001 in] feeler gauge to measure local cylinder head combustion surface flatness. Check between the cylinder bores and also between the coolant passages. If the 0.0254 mm [0.001 in] feeler gauge fits under the 2 foot straightedge or if the cylinder head is pitted, has grooves or other damage, the cylinder head **must** be replaced.

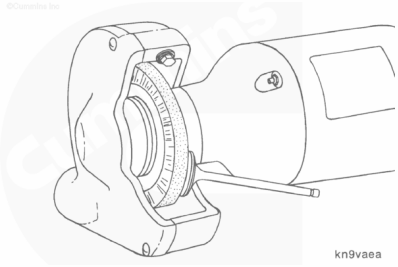
⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

ANADOLU ISUZU

⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.



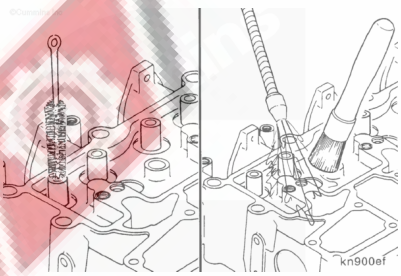
Clean the valve heads. Use a soft wire wheel.

Note : Keep the valves in a labeled rack to prevent mixing prior to making measurements.

Polish the valve stems. Use abrasive pad, Part Number 3823258, or equivalent, and diesel fuel or solvent.

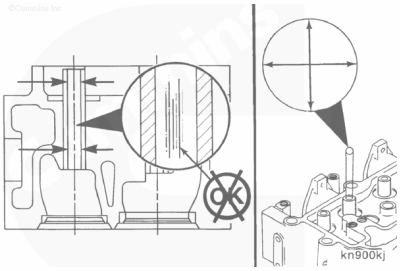
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



Use a bristle brush to clean the inside diameter of the valve guide bore and blow out with compressed air.

Inspect the valve guides for scuffing, scoring, chips, or cracks.

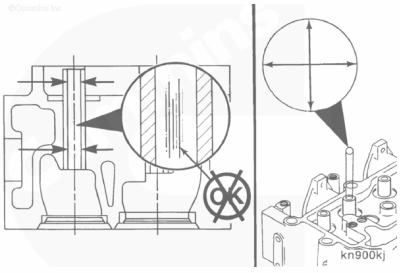


Measure the valve guide inside diameter.

Valve Guide Inside Diameter		
mm		in
8.019	MIN	0.3157
8.071	MAX	0.3178

If the valve guide inside diameter is worn larger than the maximum specified, the cylinder head **must** be replaced.

Inspect the valve guides for scuffing, scoring, chips, or cracks.



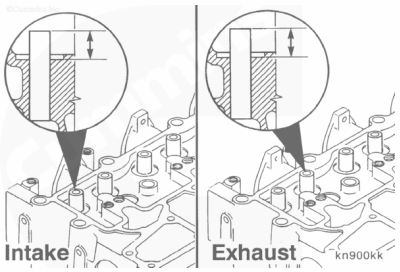
Measure the valve guide inside diameter.

Valve Guide Inside Diameter		
mm		in
8.019	MIN	0.316
8.081	MAX	0.318

ANADOLU ISUZU AFTER SALES

If the valve guide inside diameter is worn larger than the maximum specified, the cylinder head **must** be replaced.

Use a depth micrometer to measure the valve guide installed height. Measure from the top of the valve guide to the bottom of the recessed area.

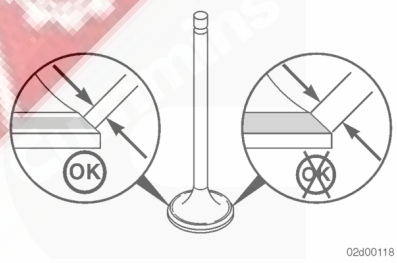


Valve Guide Height (Installed)		
mm		in
13.15	MIN	0.518
13.65	MAX	0.537

If the valve guide height is outside the specification, the cylinder head **must** be replaced.

Verify the valve sealing area is in the center of the valve. If the sealing area extends to the top or bottom of the valve, the valve **must** be replaced.

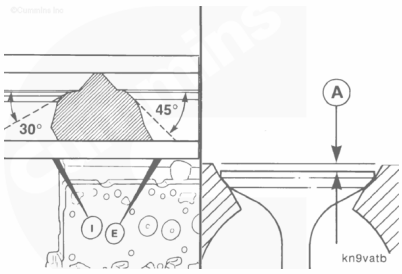
After replacing the valve, recheck the valve sealing area. If the sealing area still extends to the top or bottom of the valve, the valve seat **must** be replaced.



Use a lead pencil or Dykem™ marking pen to mark across the valve face. Install the valve in the valve guide. Hold the valve against the valve seat. Rotate the valve backward and forward three or four times. Correct contact against the valve seat will break the marks on the valve face.

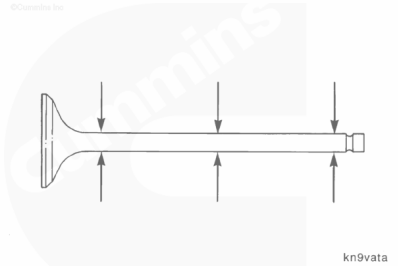
Valve seat angle:

- Intake is 30 degrees.
- Exhaust is 45 degrees.



Inspect for abnormal wear or scuffing on the heads and stems.

Measure the valve stem diameter.



Valve Stem Diameter		
mm		in
7.96	MIN	0.313
7.98	MAX	0.314

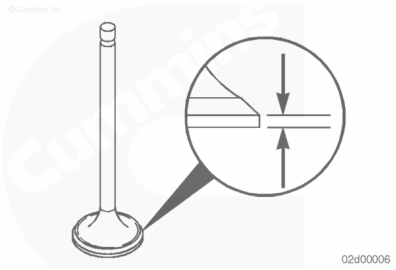
Replace any valve found outside these dimensions.

Check the valve stem tip for flatness.

Inspect for bent valves.

Measure the rim thickness.

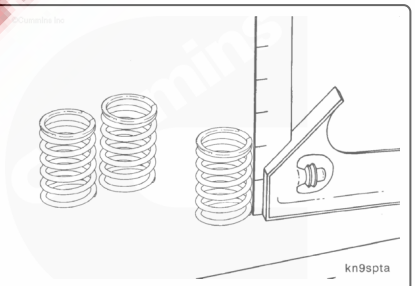
Note : Measure 90 degrees apart to verify uniformity of lap.



If the valve thickness is **not** within the limits, a new valve **must** be used.

Valve Rim Thickness			
	mm		in
Exhaust	1.83	MIN	0.072
Intake	2.20	MIN	0.087

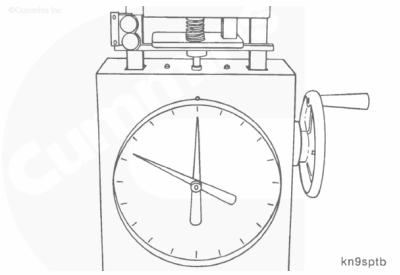
Inspect the valve springs.



A load of 906 to 1007 N [204 to 226 lbf] is required to compress the spring to a height of 30.6 mm [1.20 in]. Use spring compressor tool, Part Number 3375182, to measure spring force.

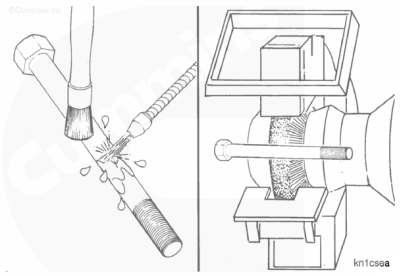
Replace the valve spring if the load required to compress the spring is outside the specification.

Note : Valve springs **must** be replaced in pairs under the same cross head. If one spring does **not** meet the specification, replace both valve springs under the same cross head.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



ANADOLU ISUZU AFTER SALES

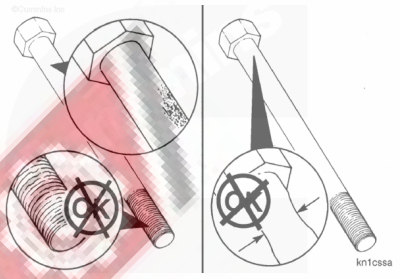
⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

Use a petroleum-based solvent to clean the capscrews.

Clean the capscrews thoroughly. Use a wire brush or a soft wire wheel. A non-abrasive bead blaster can be used to remove deposits from the shank and the threads.

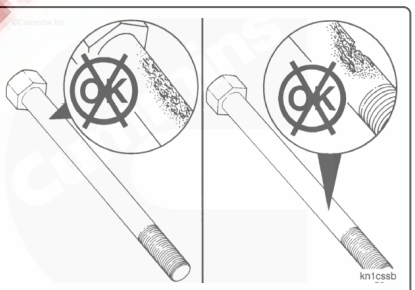
Inspect the cylinder head capscrews for damaged threads, corroded surfaces, or a reduced diameter (due to capscrew stretching).



Do **not** reuse cylinder head capscrews under the following conditions:

Visible corrosion or pitting exceeds 1 sq cm [0.155 sq in] in area. Example:

- Acceptable is 9.525 x 9.525 mm [3/8 x 3/8 in].
- Unacceptable is 12.700 x 12.700 mm [1/2 x 1/2 in].



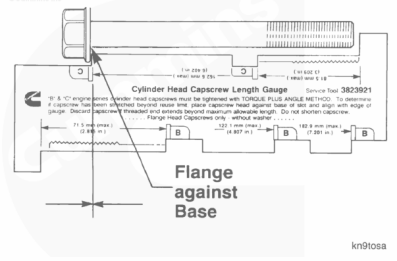
- Visible corrosion or pitting exceeds 0.12 mm [0.005 in] in depth.
- Visible corrosion or pitting is located within 3.2 mm [1/8 in] of the fillet or threads.
- Stretched beyond "free length" maximum. Reference the measurement procedure below.

Capscrew Length Gauge, Part Number 3823921

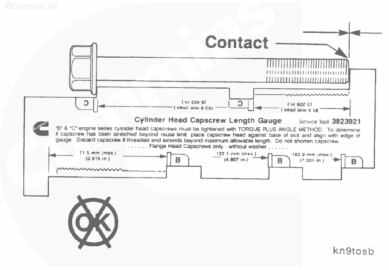
Free Length Measurement

Note : If the capscrews are **not** damaged, they can be reused throughout the life of the engine, unless the specified "free length" is exceeded.

To check the capscrew free length, place the head of the capscrew in the appropriate slot with the flange against the base of the slot.



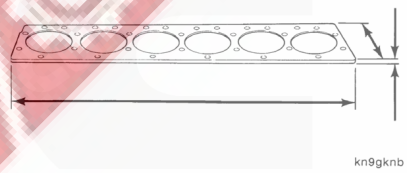
If the end of the capscrew touches the foot of the gauge, the capscrew is too long and **must** be discarded. The maximum capscrew free length is 162.6 mm [6.4 in].



Cylinder Head Capscrew Free Length		
mm		in
162.6	MAX	6.4

Pressure Test

A cylinder head test fixture can be fabricated from a flat piece of steel or aluminum. See the following table for test fixture dimensions.

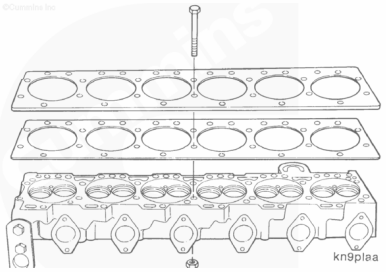


Test Fixture Dimensions		
16 mm	Thickness	0.630 in
851 mm	Length	33.5 in
203 mm	Width	8.0 in

Use a cylinder head gasket as a pattern for drilling the capscrew holes.

Install the cylinder head water test fixture.

- Install a new head gasket.
- Install the test plate.



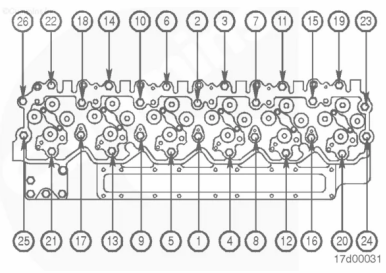
Install the following:

- 26 - Reuse existing cylinder head capscrews.
- 26 - M14 x 2 hexagon flange nuts.
- 52 - 14 mm washers, Part Number 4096383.

Place a washer between each capscrew and the head, and between each nut and test plate. This will prevent mutilation on the surface of the cylinder head.

Tighten the 26 nuts in the sequence shown in the illustration.

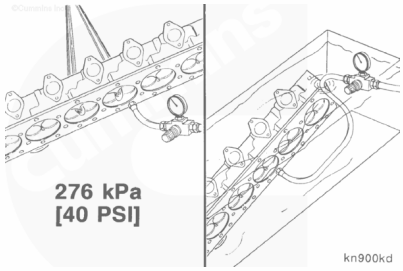
Torque Value: 110 n•m [81 ft-lb]



ANADOLU ISUZU PARTS SALES

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



Connect a regulated air supply hose to the test fixture plate.

Apply air pressure.

Measurements		
	kpa	psi
Air Pressure	276	40

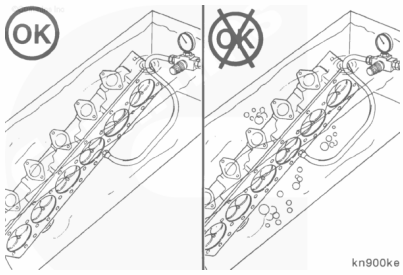
Use a nylon lifting strap and hoist to place the cylinder head in a tank of heated water.

Measurements		
	celsius	fahrenheit
Water Temperature	60	140

The cylinder head **must** be completely submerged in the water.

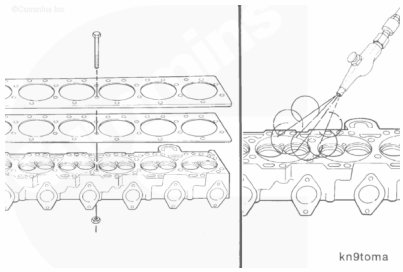
Inspect the cylinder head. Bubbles indicate an air leak.

If the cylinder head leaks, it **must** be replaced.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



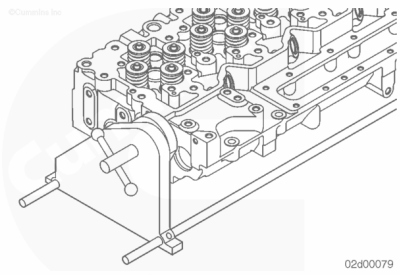
Remove the test fixture.

Use compressed air to dry the cylinder head.

ANADOLU ISUZU PARTS

Assemble

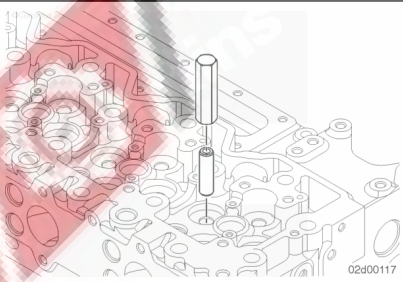
Install the cylinder head in cylinder head holding fixture, Part Number ST 583.



Use valve guide driver, Part Number 3163100, or equivalent, to install the new valve guides.

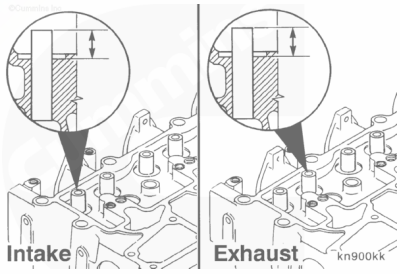
Verify the valve slides freely in the valve guide. If **not**, it can be necessary to ream the guide bore.

See the Clean and Inspect for Reuse step for valve guide inside diameter specifications.



Use a depth micrometer to measure the valve guide installed height. Measure from the top of the valve guide to the bottom of the recessed area.

Valve Guide Height (Installed)		
mm		in
13.15	MIN	0.518
13.65	MAX	0.537

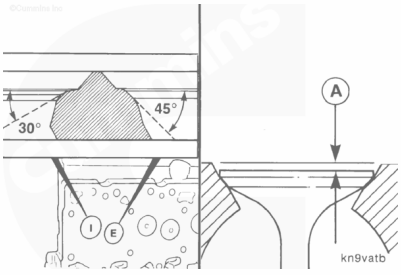


If the valve guide height is **not** within specifications, seat the guide with the installation tool.

When installing the valve seat inserts, the exhaust and intake valve seat inserts are **not** the same.

Valve seat angle:

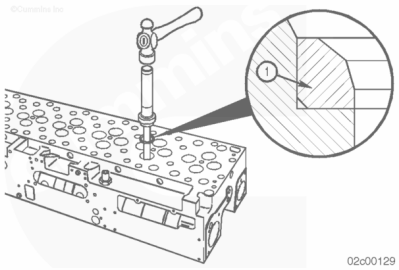
- Intake is 30 degrees.
- Exhaust is 45 degrees.



If the valve seat inserts were removed in the Disassemble section, new inserts **must** be installed.

Note : The valve guide **must** be installed prior to installing the valve seats.

Make sure the valve seat pocket and valve seat is clean before installing.



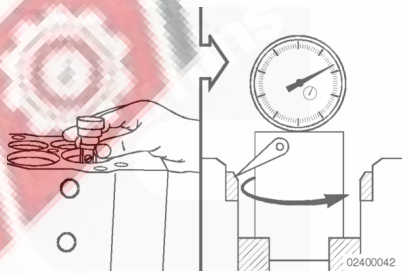
The insert chamfer (1) **must** be installed toward the bottom of the counterbore.

Use valve seat installer, Part Number 3165115, to drive the intake and exhaust valve seat inserts into the counterbore.

Use a dead blow hammer with the seat drivers to install the new valve seat inserts.

The seats **must** be fully seated into the valve seat pocket. There should **not** be a gap between the seat and the bottom of the pocket.

Measure the valve seat-to-valve guide runout. Use arbor set, Part Number 3823186, and eccentrimeter, Part Number ST 685 4, or equivalent.

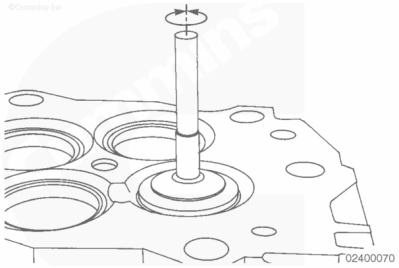


Valve-Seat-to-Valve-Guide Runout		
mm		in
0.2	MAX	0.008

If the valve seat-to-valve guide runout is **not** within specifications, one of the following actions can be taken:

- Apply Dykem™ marking pen to the valve seat and valve seating surfaces. Allow to dry. Install the valve in the valve guide. Hold the valve against the valve seat. Rotate the valve backward and forward three to four times. Verify the contact against the valve seat forms a uniform band on the valve sealing surface. If a uniform band is formed, the assembly is within specifications.
- Clean the valve/valve seat and lap the valves.
- Remove the valve seat. Make sure no debris is causing an issue under the seat. Reinstall the valve seat if debris is found.
- Remove the valve seat. Machine the valve seat pocket oversize so an oversize valve seat can be installed. See the Clean and Inspect for Reuse section above for valve seat pocket diameter specifications. Use the valve guide ID during machining to help position the valve seat pocket to valve guide ID, to make sure of a proper runout measurement after the oversize valve seat is installed.
- Replace the cylinder head.

If new valve seat inserts were installed and/or the valve leakage was above specification, the valve seat/valve can be lapped.



Lubricate the stems with Society of Automotive Engineers (SAE) engine oil before installing the valves.

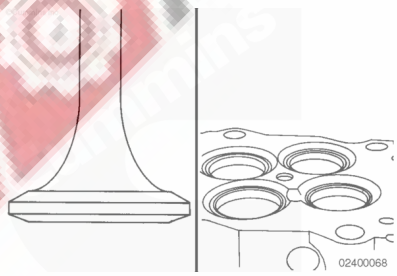
Use fine lapping compound, Part Number 3375805, or equivalent. Apply a thin and even coating on the valve.

Use a power or a hand suction lapping tool to provide pressure in the center of the valve.

Turn the valve backward and forward. Continue lapping until the compound shows a continuous contact pattern on both the valve seat insert and valve.

⚠ CAUTION ⚠

Lapping compound is an abrasive material. Damage will result if the cylinder head, valves, and valve seats are not cleaned thoroughly.



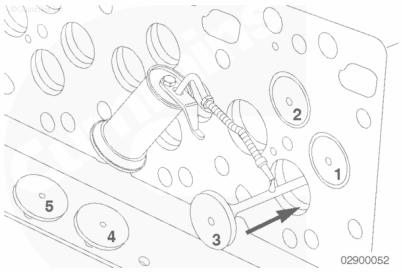
Clean the lapping compound from the parts.

Measure the valve rim thickness. See the Clean and Inspect for Reuse section.

Valves being reused **must** be installed in the same location from which they were removed.

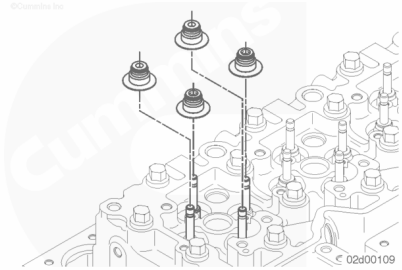
Lubricate the stems with clean engine oil before installing the valves.

Install the valves.



Install the valve seals over the exhaust valve guides.

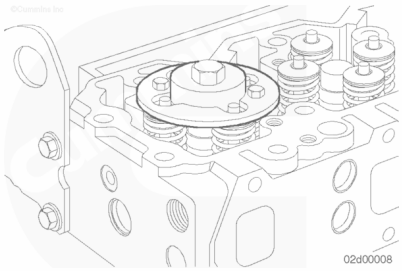
Install the valve seals over the intake valve guides.



⚠ WARNING ⚠

ANADOLU ISUZU AFTERSALES

Valve springs are under tension and can act as projectiles if released. To reduce the possibility of eye injury, wear safety glasses with side shields.

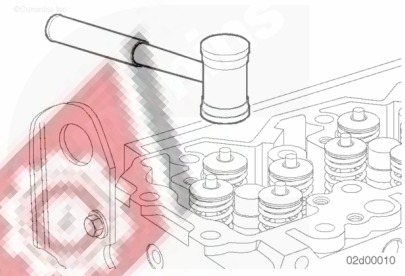


Install the valve spring retainers and valve springs.

Use valve spring compressor, Part Number 3164329, to compress the valve springs.

Install the valve collets. Release the spring tension.

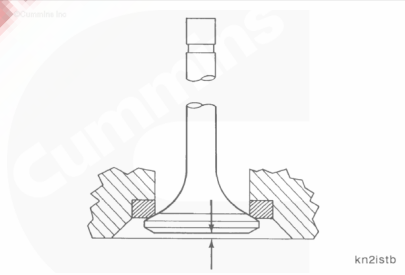
After assembly, hit the valve stems with a plastic hammer to make sure the collets are seated.



Standard Cylinder Head

Measure the valve recess.

Standard Head Valve Recess in Cylinder Head		
mm		in
0.84	MIN	0.033
1.32	MAX	0.052

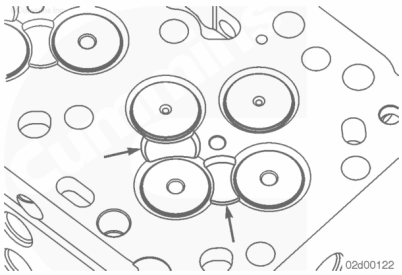


If the valve recess is outside the specifications, replace the valve. If the valve recess is still outside the specifications, the valve seat insert or cylinder head **must** be replaced.

Scallop Cylinder Head

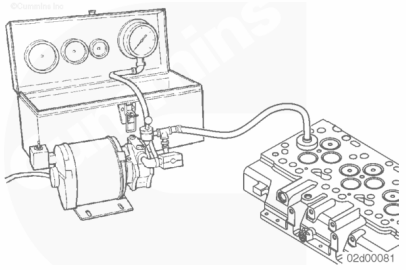
Measure the valve recess.

Scallop Head Valve Recess in Cylinder Head		
mm		in
0.69	MIN	0.027
1.17	MAX	0.046

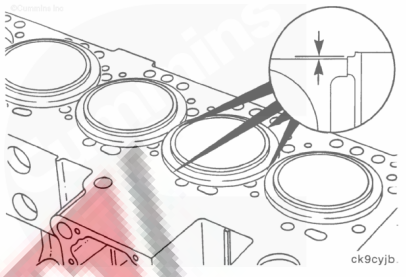


If the valve recess is outside of the specifications, replace the valve. If the valve recess is still outside the specifications, the valve seat insert or cylinder head **must** be replaced.

Before installing the cylinder head, vacuum test the cylinder head again. See the information above in the Vacuum Test section of this procedure.



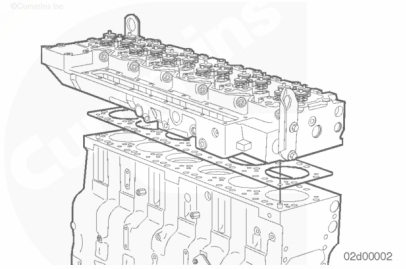
Before installing the cylinder head, check the cylinder liner protrusion. Refer to Procedure 001-028 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-028.html)



Install

⚠ CAUTION ⚠

Make sure the cylinder head gasket is correctly aligned with holes in the cylinder block. If not aligned properly, it can cause engine damage.

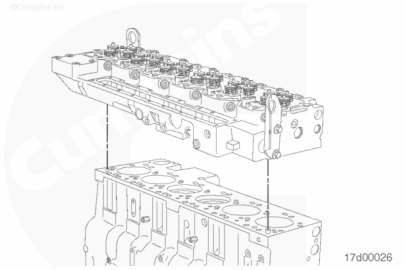


Do **not** attempt to reuse the cylinder head gasket.

Position the new cylinder head gasket over the dowels.

⚠ WARNING ⚠

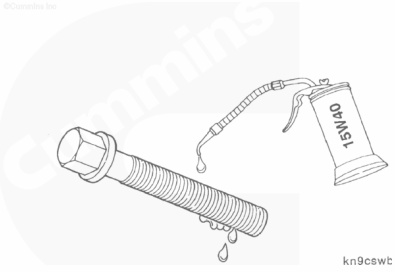
This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



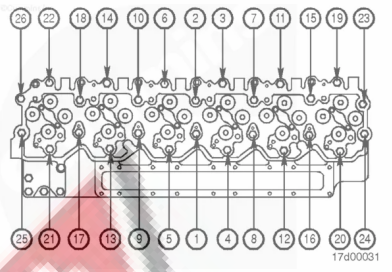
Carefully put the cylinder head straight down onto the cylinder block. Seat it onto the dowels.

If new capscrews are used, capscrew threads are to be burnished. To burnish new capscrews, tighten the capscrews as described below. Loosen the capscrews. Repeat the tightening sequence.

Lubricate the threads and under the heads on the cylinder head capscrews. Use clean engine lubricating oil.



Tighten the cylinder head capscrews in the sequence shown in the illustration.



Torque Value:

1. 50 n•m [37 ft-lb]
2. 150 n•m [111 ft-lb]
3. Loosen all capscrews.
4. 115 n•m [85 ft-lb]
5. 115 n•m [85 ft-lb]
6. Advance 120 degrees.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

Note : If the cylinder head is being replaced due to damaged exhaust valves, intake valves, pistons, or other debris-generating malfunction, refer to Service Bulletin, Prevention of Turbocharger Damage After Engine Mechanical Issue, Bulletin 4326040. (/qs3/pubsys2/xml/en/bulletin/4326040.html)

- Install the exhaust manifold. Refer to Procedure 011-007 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-007.html)
- Install the turbocharger. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)
- Install the fuel drain lines. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Install the push rods or tubes. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Install the crossheads. Refer to Procedure 002-001 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-001.html)

- Install the rocker lever. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Adjust the overhead. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)
- Install the rocker lever housing. Refer to Procedure 003-013 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-013.html)
- Install the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Install the heat shield. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)

Note : If the cylinder head or the cylinder head gasket is being replaced due to a malfunction that caused an internal coolant leak, the crankcase breather element **must** be replaced.

- Install the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Install the fuel connection tubes. Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)
- Install the fuel rail. Refer to Procedure 006-060 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-060.html)
- Install the air intake manifold. Refer to Procedure 010-023 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-023.html)
- Install the injector supply lines. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Install the air intake connection. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)
- Fill the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- If the malfunction resulted in coolant, oil, excessive fuel, or excessive black smoke entering the exhaust system, the aftertreatment system **must** be inspected. Refer to Procedure 014-017 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-017.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Last Modified: 17-Mar-2021

- Anti-seize compound
- Plastic hammer

General Information

Note : This procedure can also be used for removing the valve springs, valve spring retainers, and valve collets with the cylinder head installed.

The following procedure is for removing the valve stem seals with the cylinder head installed.

For removing the valve stem seals with the cylinder head removed, Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)

Preparatory Steps

⚠ WARNING ⚠

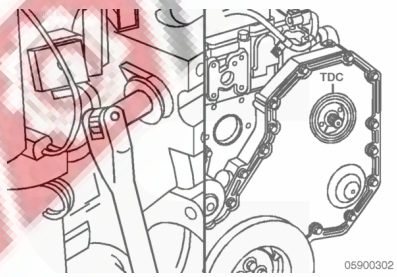
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)

- If necessary, remove the engine brake assemblies. Refer to Procedure 020-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Remove the rocker lever assemblies. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Remove the crossheads. Refer to Procedure 002-001 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-001.html)
- Remove all injectors. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

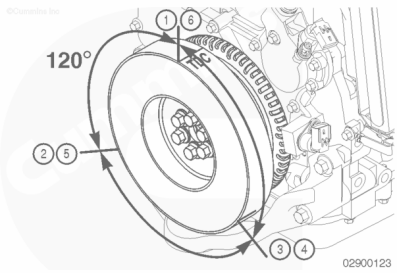
Remove

Note : In order to remove the valve springs with the cylinder head installed, the piston of the cylinder being worked on **must** be brought to top dead center (TDC) to support the valves.



Use barring tool, Part Number 5299073, to rotate the crankshaft to align the TDC marks on the gear cover and fuel pump gear.

With the TDC marks for the number 1 cylinder aligned, mark the vibration damper for the location of TDC for the other cylinders.

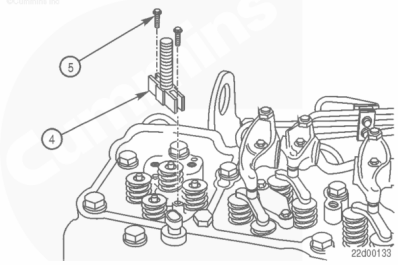


- Mark the vibration damper every 120 degrees with a marker directly on the damper or to a piece of masking tape applied to the outside diameter of the damper.

Service Tip: A protractor, camshaft degree wheel, or angle/level indicator, Part Number 3375855, can be used to locate 120 degree increments around the vibration damper.

- Mark the damper with the TDC indicator for each cylinder as shown. Two cylinders correspond to each 120 degree line.

Compress the valve springs. Use valve spring compressor, Part Number 3164329.

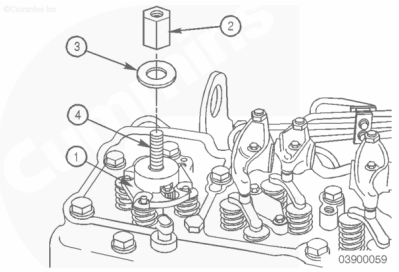


Position the replacer screw (4) above the injector bore. Install the two capscrews (5) in the cylinder head where the hold-down clamp capscrews were removed.

Tighten the capscrews.

Torque Value: 5 n•m [44 in-lb]

Note : The valves are **not** evenly spaced from the injector bore. It is important to align the slots in the valve spring compressor plate with the valve springs.



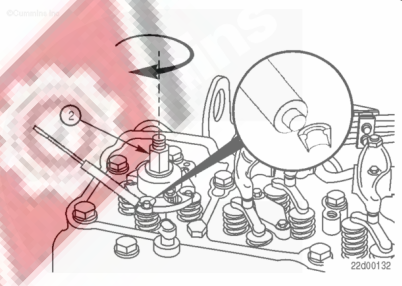
Apply anti-seize compound to the replacer screw (4) threads. **Always** read and follow label precautions.

Position the valve spring compressor plate (1) on the replacer screw (4). Align the slots in the valve spring compressor plate with the valve springs.

Install the washer (3) and nut (2) on the replacer screw (4).

⚠ WARNING ⚠

Wear appropriate eye and face protection when performing this procedure. Springs are under tension and can act as a projectile if released, causing personal injury.



Turn the nut (2) **clockwise** to compress the valve springs.

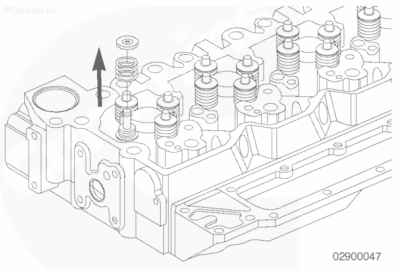
Continue turning the nut (2) **clockwise** until the valve collets can be removed using a magnetic tool, such as the end of a magnetic screwdriver.

Note : Because there is a gap between the top of the piston and valve face, it can be necessary to use a second magnet to hold the valve stem up to remove the valve collets.

Remove the valve collets and valve spring compressor service tool.

⚠ CAUTION ⚠

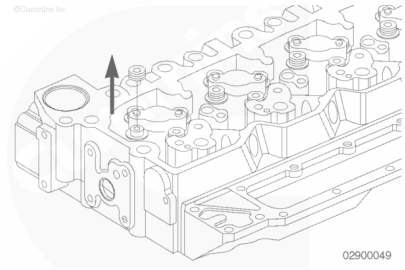
With the valve collets, valve springs, and valve spring retainers removed, do not rotate the engine. Rotating the engine will allow the valves to drop into the cylinder requiring the cylinder head to be removed or possible engine damage.



Remove the four valve spring retainers and valve springs.

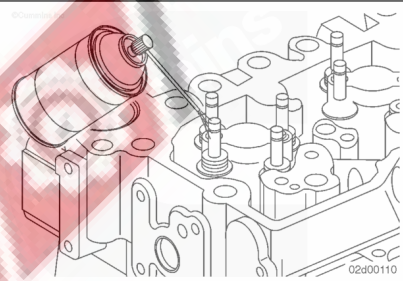
Remove the valve stem seals. Use boot pliers, Part Number 3163293.

ANADOLU ISUZU PARTS



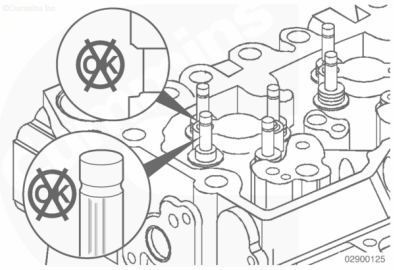
Clean and Inspect for Reuse

Clean the seal tower and valve stem. Use electrical contact cleaner, Part Number 3824510.



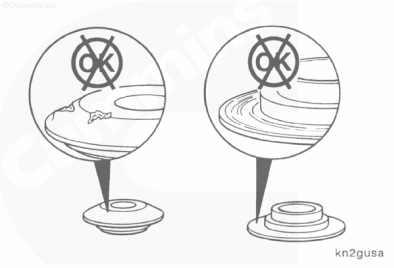
Inspect the exposed valve stem for scoring or heavy polishing. Inspect the valve collet grooves for wear.

If the valve stem is damaged, the cylinder head **must** be removed and the valve replaced. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)



Inspect the valve spring retainers and valve collets for damage or worn areas.

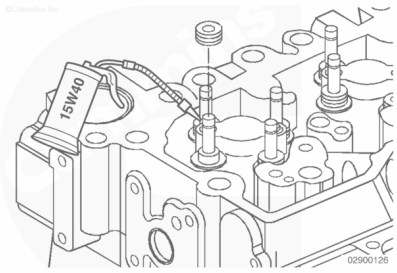
Discard and replace damaged and worn parts.



Install

⚠ CAUTION ⚠

The same color valve stem seal must be installed in the same location as removed. Incorrect valve stem seals will result in excessive oil consumption and internal engine damage.



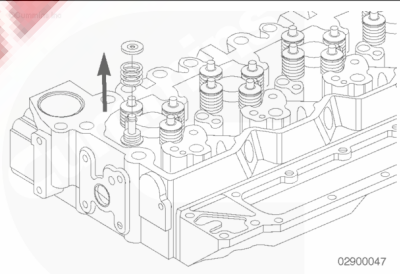
⚠ CAUTION ⚠

Lubricate all the valve guide bores and valve stems with Society of Automotive Engineers (SAE) engine oil. Failure to lubricate the valve guides and valve stems can result in premature valve guide wear.

Install new valve stem seals. The intake and exhaust valve guide seals are the same color.

Lubricate the stems with SAE engine oil before installing the valve stem seals.

Install the valve spring retainer and valve springs.

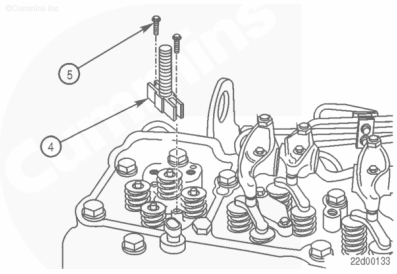


Compress the valve springs using valve spring compressor, Part Number 3164329.

Position the replacer screw (4) above the injector bore. Install the two capscrews (5) in the cylinder head where the hold-down clamp screws were removed.

Tighten the capscrews.

Torque Value: 5 n•m [44 in-lb]

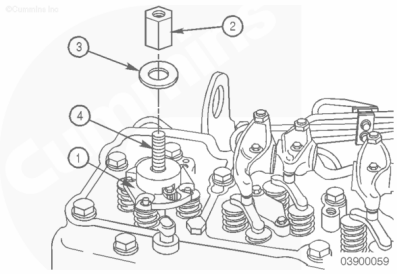


Note : The valves are **not** evenly spaced from the injector bore. It is important to align the slots in the valve spring compressor plate with the valve springs.

Apply anti-seize compound to the replacer screw (4) threads. **Always** read and follow label precautions.

Position the valve spring compressor plate (1) on the replacer screw (4). Align the slots in the valve spring compressor plate with the valve springs.

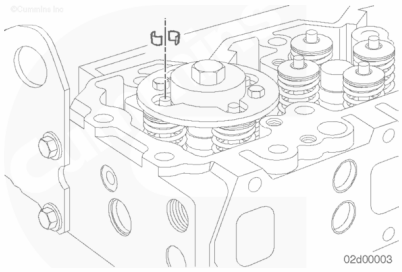
Install the washer (3) and nut (2) on the replacer screw (4).



ANADOLU ISUZU PARTS SALES

⚠ WARNING ⚠

Wear appropriate eye and face protection when performing this procedure. Springs are under tension and can act as a projectile if released, causing personal injury.



Note : Because there is a gap between the top of the piston and the valve face, it can be necessary to use a second magnet to pull the valve stem up to remove the valve collets.

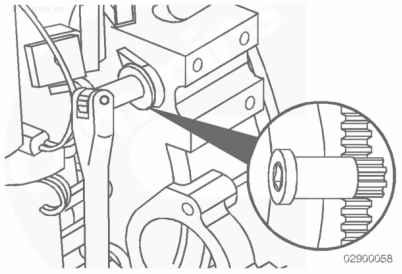
Compress the valve springs until the valve collets can be installed.

Install the valve collets.

Service Tip: Use assembly lubricant, Part Number 3163087, or equivalent, on the valve collets to help hold them in place until the valve spring compressor is released.

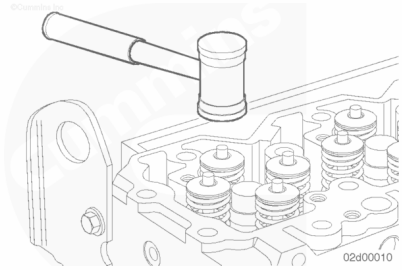
Remove the valve spring compressor service tool.

Use the marks made previously on the vibration damper. Rotate the engine to the next mark to replace the valve guide seals on the next pair of cylinders.



⚠ WARNING ⚠

To reduce the possibility of personal injury, wear eye protection. If the collets are not correctly installed, they can fly out when the stems are hit with a hammer.



⚠ CAUTION ⚠

Rotate the engine to the next cylinder in the firing order before hitting the valve stem of the cylinder previously worked on. This will ensure the valve does not contact the piston, resulting in a bent valve and internal engine damage.

ANADOLU ISUZU AFTER SALES

After rotating the engine to the next cylinder in the firing order, hit the valve stems of the cylinder previously worked on with a plastic hammer to make sure the collets are seated.

Repeat the previous steps until all of the valve stem seals have been replaced.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the injectors. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)
- Install the crossheads. Refer to Procedure 002-001 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-001.html)
- Install the rocker lever assemblies. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Adjust the overhead. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)
- Install the engine brake assemblies, if removed. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

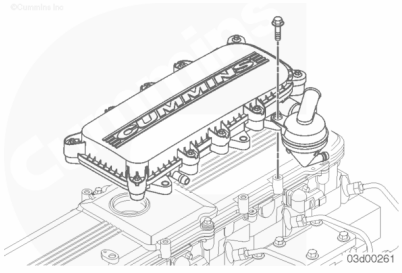
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the crankcase breather tube and drain tubes. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)

Remove

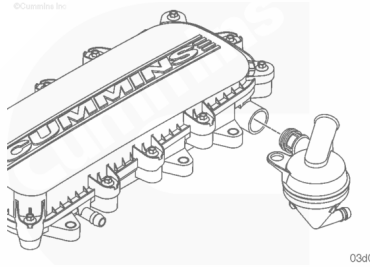
Remove the six mounting capscrews.

Remove the breather from the rocker lever cover by pulling straight up on the breather assembly.



Remove the oil separator from the breather housing.

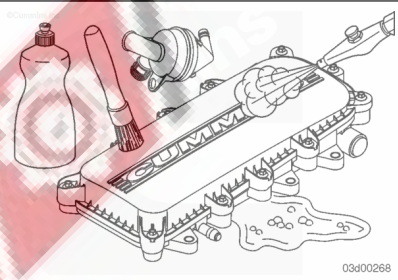
ANADOLU ISUZU



Clean and Inspect for Reuse

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



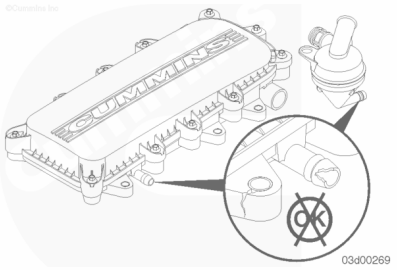
Cover the oil inlet, oil drain, and draft line connections to prevent debris from entering the crankcase breather element. Use hot, soapy water and a soft brush to clean the crankcase breather and separator.

Dry with compressed air.

Note : If necessary, disassemble the crankcase breather and remove the crankcase breather element in order to clean the housing. Refer to Procedure 003-019 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-019.html)

Inspect the crankcase breather and separator for cracks or other damage.

Replace parts as necessary.

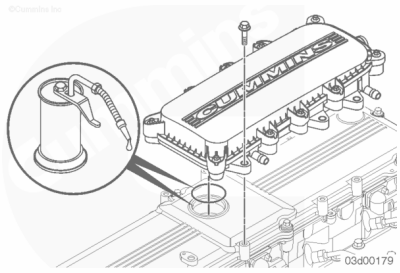


Install

Install a new o-ring on the breather.

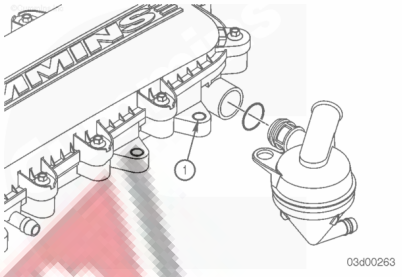
Lubricate the o-ring and the valve cover o-ring seat. Use lubricating oil.

Install the breather into the rocker lever cover.



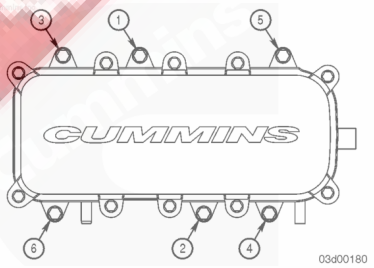
Install a new o-ring on the oil separator. Attach it to the breather housing.

Make sure the mounting location for the oil separator is aligned with a rear breather housing mounting location (1).



Tighten the capscrews in the sequence shown.

Torque Value: 18 n•m [159 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

Recommended Cummins® Service Tools

- Barring tool, Part Number 5299073, or equivalent

Additional Service Items

- Feeler gauge

Preparatory Steps

⚠ WARNING ⚠

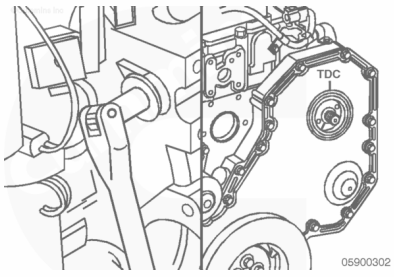
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the exhaust gas exhaust gas recirculation (EGR) connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025-tr.html)
- Remove the plastic fuel pump drive cover located on the front of the engine.
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011-tr.html)

Adjust

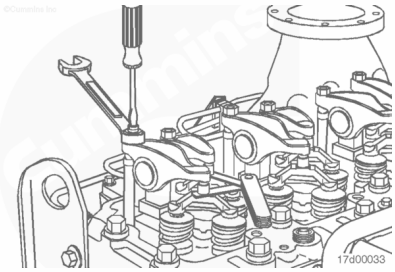
⚠ CAUTION ⚠

Engine coolant temperature should be less than 60°C [140°F].



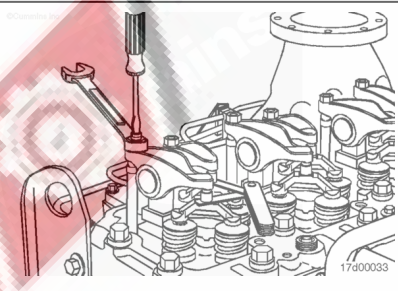
Use barring tool, Part Number 5299073, or equivalent. Rotate the crankshaft to align the top dead center marks on the gear cover and fuel pump gear.

With the engine in this position, lash can be checked on the following rocker arms: 1I, 1E, 2I, 3E, 4I, and 5E.



Lash Check Limits			
	mm		in
Intake	0.152	MIN	0.006
	0.559	MAX	0.022
Exhaust	0.381	MIN	0.015
	0.813	MAX	0.032

Measure lash by inserting a feeler gauge between the crosshead and rocker lever ball insert and socket while lifting up on the end of the rocker arm. If the lash measurement is out of specification, loosen the locknut and adjust the lash to the nominal specification.



Lash Reset Specifications			
	mm		in
Intake	0.305	NOM	0.012
Exhaust	0.559	NOM	0.022

Note : Lash resets are **only** required at the interval specified in the appropriate owner's or operation and maintenance manual when lash is measured and found out of specification, or when engine repairs cause removal of the rocker arms and/or loosening of the adjusting screws.

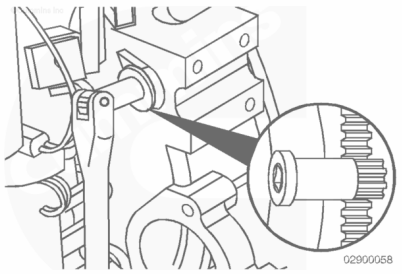
Tighten the locknut. Measure again.

Torque Value: 24 n•m [212 in-lb]

Install the nut cap on the exhaust adjusting screws for engine brakes, if applicable.

Torque Value: 24 n•m [212 in-lb]

Use barring tool, Part Number 5299073, or equivalent. Rotate the crankshaft 360 degrees. Measure lash for rocker arms 2E, 3I, 4E, 5I, 6I, and 6E. Reset the lash, if out of specification.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Install the EGR connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Install the plastic fuel pump drive cover located on the front of the engine.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

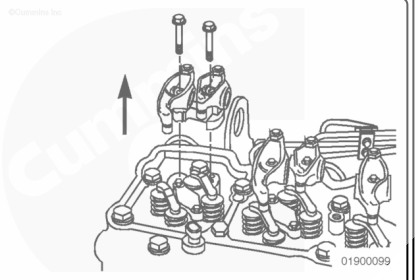
- Disconnect the batteries. See equipment manufacturer service information.
- Remove the crankcase breather tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Remove the exhaust gas recirculation (EGR) connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)

Remove

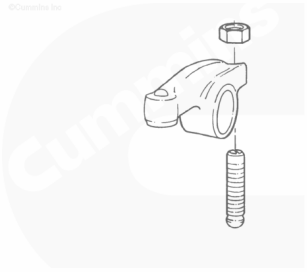
Remove the capscrews from the rocker lever pedestals.

Remove and mark the pedestals and rocker lever assemblies one at a time as to their location and position.

The rocker assemblies **must** be installed in their original location and position.

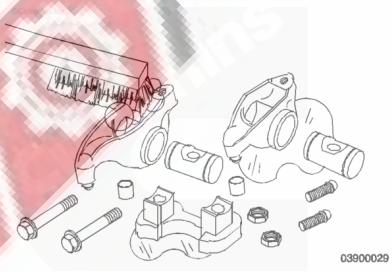


Remove the locknut and adjusting screw.



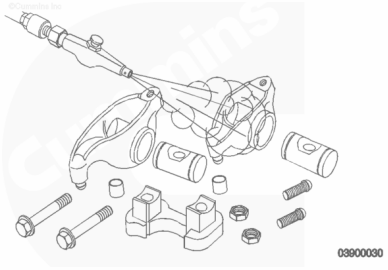
Clean and Inspect for Reuse

Clean all parts in a strong solution of laundry detergent in hot water.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



Use compressed air to dry the parts after rinsing in clean hot water.

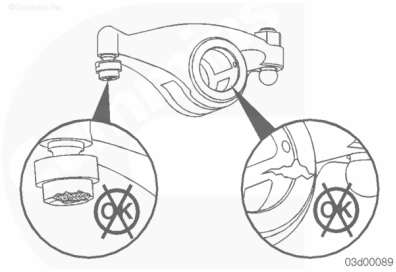
The pedestals are made from powdered metal and will continue to show wetness after they have been cleaned and dried.

Make sure the oil drillings in the rocker arms and shafts are unobstructed.

Inspect for cracks and excessive wear in the bore.

The socket should move freely on the rocker lever. The plastic socket retainer should be in place and **not** cracked.

Inspect for wear on the nose of the socket.



AYRDOU ISUZU PARTS

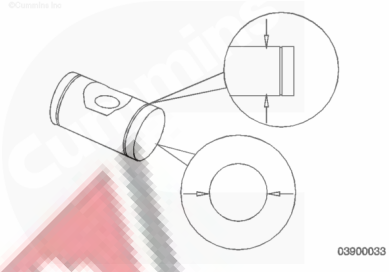
Measure the rocker lever bore.

Rocker Lever Bore		
mm		in
24.987	MIN	0.984
25.013	MAX	0.985

Inspect the rocker lever pedestal and rocker lever shaft for cracks.

Measure the rocker lever shaft diameter.

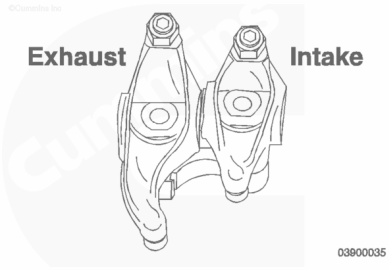
Rocker Lever Shaft		
mm		in
24.950	MIN	0.982
24.962	MAX	0.983



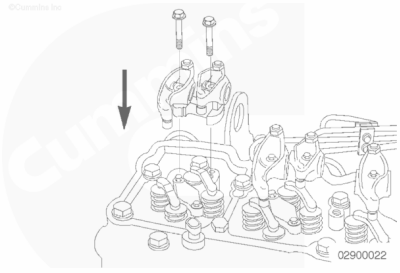
Install

Without Engine Brakes

Position the rocker levers on the rocker pedestal.



Install the rocker lever assemblies and pedestals in their original locations.

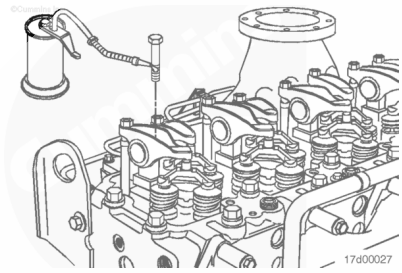


Lubricate the capscrew threads. Use clean engine oil.

Install and tighten the pedestal capscrews.

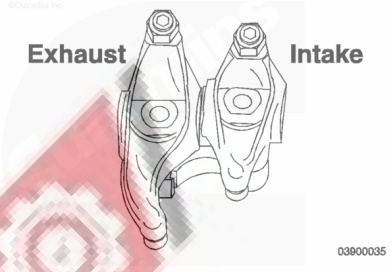
Torque Value: 65 n•m [48 ft-lb]

ANADOLU ISUZU AFTER SALES



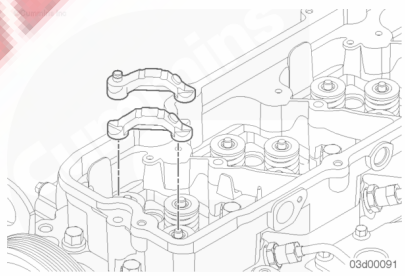
With Engine Brakes

Position the rocker levers on the rocker pedestal.



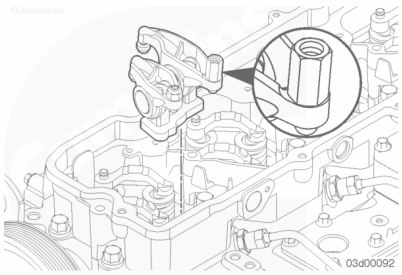
Install the crossheads in their original location and position.

Install the engine brake compatible exhaust crossheads with the pin facing the exhaust manifold.



Install the rocker lever assemblies and pedestals in their original location.

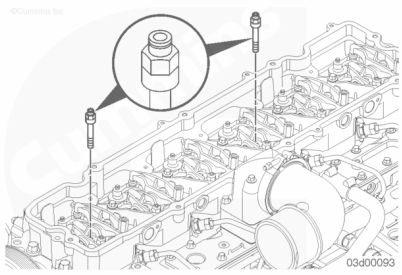
Make sure the exhaust rocker levers have the longer adjusting screw locknut installed.



Lubricate the capscrew threads. Use clean engine oil.

Install the engine brake oil supply capscrews on intake rocker levers 1 and 4.

Torque Value: 65 n•m [48 ft-lb]

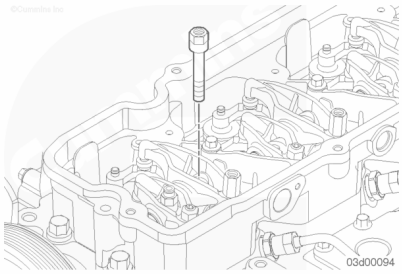


Lubricate the capscrew threads. Use clean engine oil.

ANADOLU ISUZU AFTER SALES

Install the exhaust rocker lever capscrews into all exhaust levers.

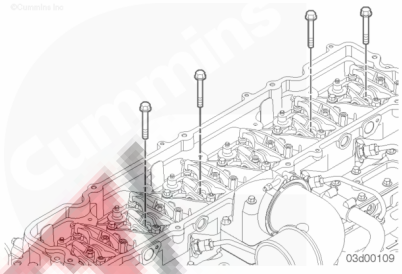
Torque Value: 65 n•m [48 ft-lb]



Lubricate the capscrew threads. Use clean engine oil.

Install the pedestal capscrews in cylinders 2, 3, 5, and 6 intake rocker pedestals.

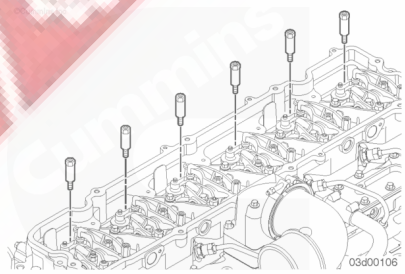
Torque Value: 65 n•m [48 ft-lb]



Lubricate the capscrew threads. Use clean engine oil.

Install the six threaded spacers into the cylinder head.

Torque Value: 24 n•m [212 in-lb]



Finishing Steps

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

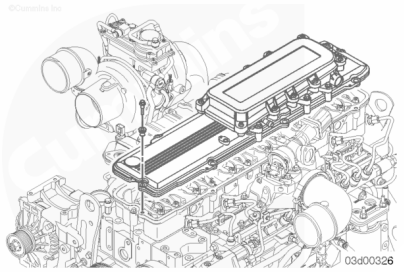
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the exhaust gas recirculation (EGR) connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025-tr.html)
- Disconnect and remove the aftertreatment intake NOx sensor. Refer to Procedure 019-463 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-463.html)
- Disconnect the crankcase pressure sensor. Refer to Procedure 019-445 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-445.html)
- Remove the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)

Remove

Remove the capscrews.

Remove the rocker lever cover and gasket.



Note : The rocker lever cover can be taller if the engine is equipped with engine brakes.

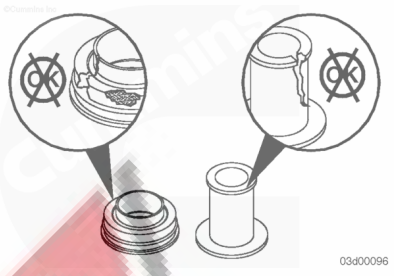
Note : It is **not** necessary to remove the crankcase breather in order to remove the rocker lever cover.

Note : It is **not** necessary to remove the heat shield in order to remove the rocker lever cover.

Clean and Inspect for Reuse

Check the isolators for cracks, tears, or brittleness.

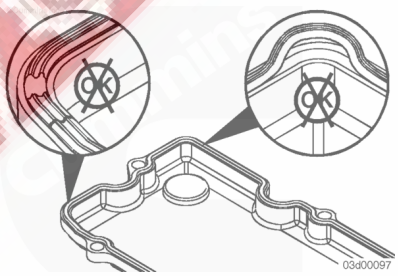
Replace the isolators if any damage is found.



Check the gasket for cracks on the sealing surface.

Replace the gasket if damage is present.

Replace the gasket if it is removed from the groove in the rocker lever cover.

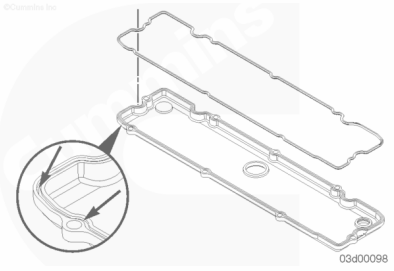


Install

Note : If the gasket has been removed from the rocker lever cover, a new gasket **must** be installed.

The following installation procedure **must** be used when installing the press in gasket.

1. Press the molded gasket into the corners of the rocker lever cover.
2. Press the gasket around the capscrew mounting holes.
3. Press the remaining gasket into the rocker lever cover.



Install the rocker lever cover and capscrews.

Torque Value: 12 n•m [106 in-lb]

Tighten the capscrews in the sequence shown.

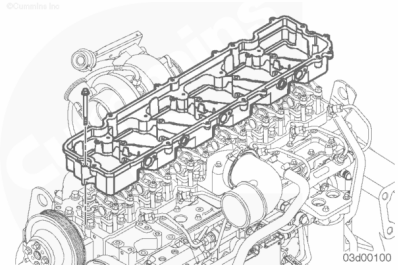
- Remove the heat shield. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Disconnect the injector harness pass-through connectors.
- Remove the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Disconnect the injector wiring harness from the injector. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

Remove

Remove the rocker lever housing mounting capscrews.

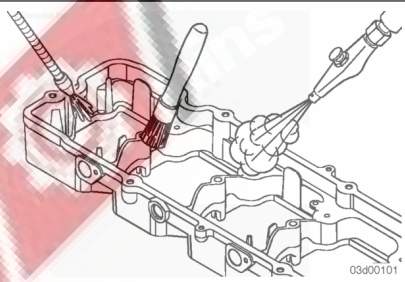
Remove the rocker lever housing and gasket from the cylinder head.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

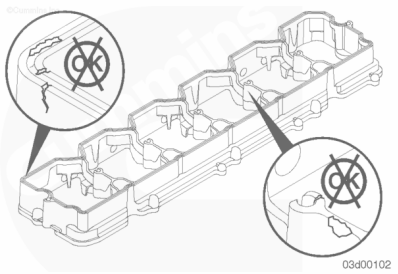
Remove the rocker lever housing gasket.

Make sure the work surface is clean and free from any oil, dirt, or debris.

Clean the rocker lever housing. Use solvent. Dry with compressed air.

Inspect the rocker lever housing for cracks or any other damage, especially on the cylinder head mounting surface.

Inspect the bridge area in the center of the rocker lever housing for cracks.

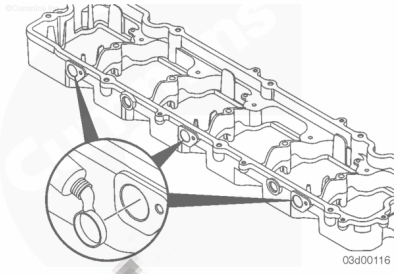


Install

Install the 22 mm cup plugs into the rocker lever housing.

Coat the contact surface of cup plug. Use Permatex® sealant, or equivalent.

Install the cup plugs flush with the outer surface of the rocker lever housing.



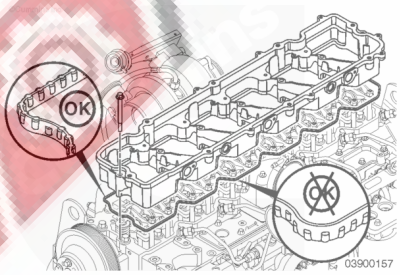
Note : A new rocker lever housing gasket **must** be used when the rocker lever housing is removed. Do **not** reuse the old gasket.

Note : Unpack the gasket. Lay it out in front of the grooved section of the rocker lever housing. Align the gasket in the position in which it will be installed. Confirm the gasket is not twisted.

Note : Make sure the orientation of the gasket matches the corresponding features in the rocker lever housing and the beaded side of the gasket is installed into the housing.

Install the new rocker lever housing gasket. Start by pressing the beaded side of the gasket into the corresponding features of the rocker lever housing. Press the remaining gasket into the housing.

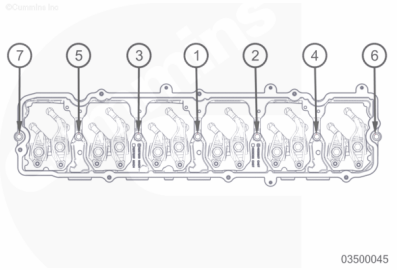
Install the rocker lever housing on the cylinder head.



Install the capscrews. Tighten. Start with the center capscrew and work outward in a spiral pattern.

Capscrews are not installed in the perimeter holes of the rocker lever housing. These holes are used to install another component onto the rocker lever housing.

Torque Value: 24 n•m [212 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the injector wiring harness to the injectors. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)
- Connect the injector harness pass-through connectors.
- Install the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Install the heat shield. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Install the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Install the EGR connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Last Modified: 27-Apr-2018

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® service tools required.

Additional Service Items

- Soft brush

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

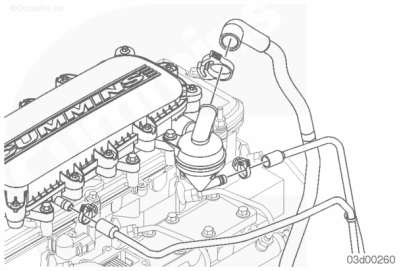
- Disconnect the batteries. See equipment manufacturer service information.

Remove

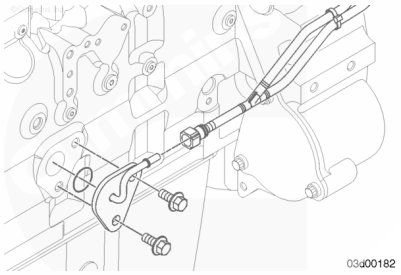
Remove the crankcase breather tube from the crankcase breather assembly.

Remove the crankcase drain lines from the crankcase breather assembly.

Remove the snapper hose clamps from the drain tube and lines.



Remove the breather drain lines, breather drain line cover, and gasket from the cylinder block.



ANADOLU ISUZU AFTER SALES

Clean and Inspect for Reuse

⚠ WARNING ⚠

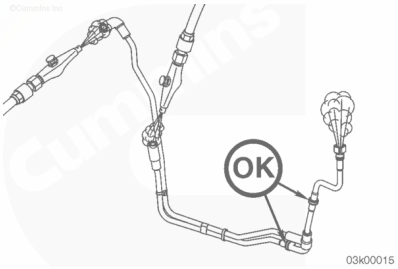
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Check the tube and lines internally for obstructions or sludge buildup.

Clean the tube and lines. Use hot, soapy water and a soft brush.

Use compressed air to dry the tube and lines after rinsing in clean water.

Inspect the breather drain line check valve for correct operation. A small amount of air can be blown through the line (less than 34 kPa [5 psi]) to check the check valve operation.

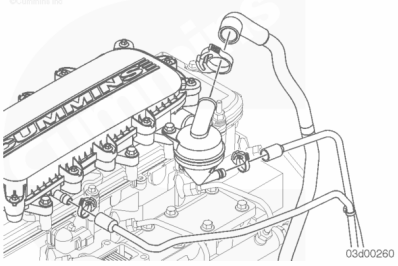


Note : To properly test each check valve, the inlet of the breather drain line **not** being tested **must** be covered to force air down the correct path.

Note : An obstructed drain tube or line will lead to excessive crankcase pressure.

Install

Note : Make sure the crankcase breather tube or drain lines do **not** contact any high pressure fuel lines.

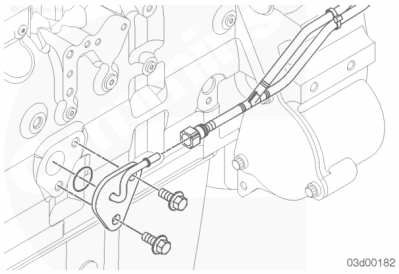


Install the crankcase breather tube to the crankcase breather assembly.

Install the crankcase drain lines to the crankcase breather assembly.

Install the breather drain line cover, gasket, and tube to the cylinder block.

Torque Value: 45 n•m [33 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

- Disconnect the batteries. See equipment manufacturer service information.
- Clean the crankcase breather cover area. Use steam. Dry with compressed air.

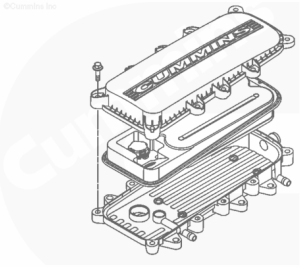
Remove

Remove the eleven crankcase breather cover capscrews.

Note : The six capscrews attaching the crankcase breather base to the valve cover do **not** need to be removed.

Remove the crankcase breather cover.

Remove the crankcase breather element.

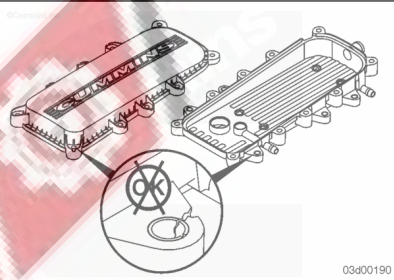


03d00189

Clean and Inspect for Reuse

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



03d00190

Inspect the breather cover and base for cracks or other damage.

Check for internal obstructions or sludge buildup.

Clean the crankcase breather cover. Use hot, soapy water and a soft brush.

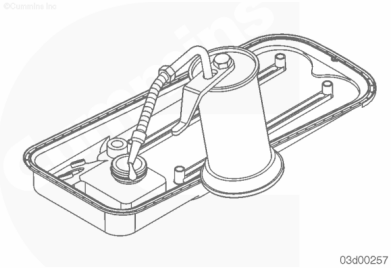
Rinse the cover with clean water. Dry with compressed air.

Note : Do **not** use soapy water to clean or rinse the breather base. Clean the base with a wet rag to prevent water from entering the crankcase.

Install

Lubricate the breather element o-ring seal. Use clean lubricating oil.

Use the following procedure for breather element recommendations. Refer to Procedure 018-024 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-024.html)

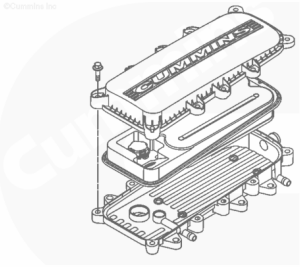


03d00257

Install the new breather element onto the breather base.

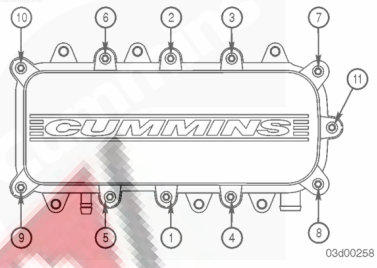
Install the crankcase breather cover.

Install the eleven crankcase breather cover capscrews.



Tighten the capscrews in the sequence shown.

Torque Value: 5 n•m [44 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the exhaust gas recirculation (EGR) connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Remove the crankcase breather tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Remove the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)

Remove

Mark the push tubes to identify their location.

Remove the push tubes.

Clean and Inspect for Reuse

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the push tubes in hot soapy water. Dry with compressed air.

Inspect the push tube ball and socket for signs of scoring. Check for cracks where the ball and socket are welded into the tube.

Check the push tubes for straightness.

Install

Install the push tubes in their original location.

Install the push tubes into the sockets of the valve tappets.

Lubricate the push tube sockets. Use clean engine oil.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)

ANADOLU ISUZU AFTER SALES

- Adjust the valve lash. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the exhaust gas recirculation (EGR) connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Remove the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Remove the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Remove the push rods or tubes. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)

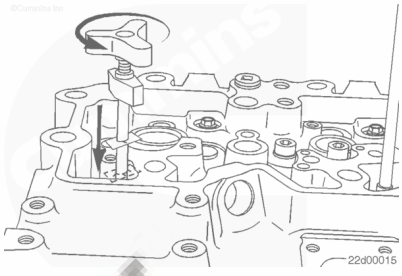
Remove

Use Tappet Removal Tool Kit, Part Number 3165088, to remove the tappets.

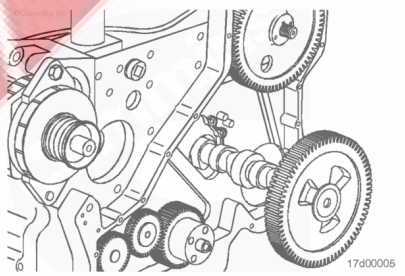
Insert the tappet extractor tool (2) into the tappet bore. Turn the top knob **counterclockwise** while holding the bottom knob to expand and secure the tool into the tappet.

Raise the tappet extractor (2) until it stops. Push the metal tab down against the head surface to secure the tool and captured tappet in the up position.

Repeat for the remaining tappets.

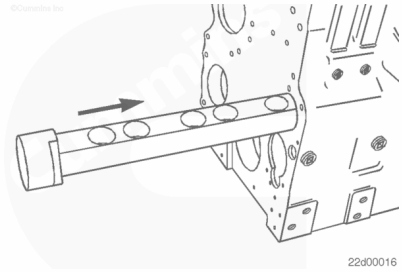


Remove the camshaft. Refer to Procedure 001-008 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-008.html)

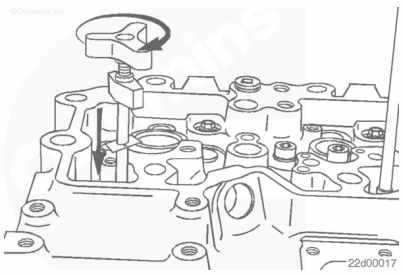


Make sure the holes are in the up position.

Insert the tappet holder to the full length of the camshaft bore.

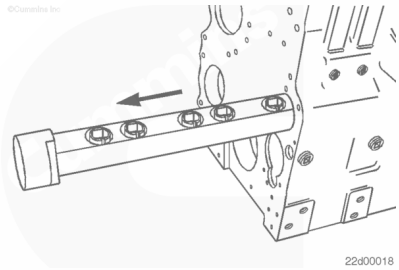


Lower the tappet extractor. Seat the tappet into the tappet holder. Turn the top knob **clockwise** while holding the bottom knob to disengage the extractor from the tappet. Repeat the step for the remaining tappets.



Carefully pull the tappet holder and tappets from the camshaft bore. If the tappets will be reused, be sure to note their position. Do **not** install a tappet in a different position.

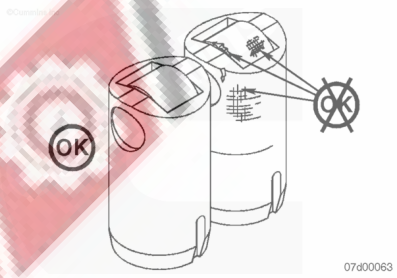
ANADOLU ISUZU AFTERSALES



Clean and Inspect for Reuse

Inspect the tappet body for cracks or other damage.

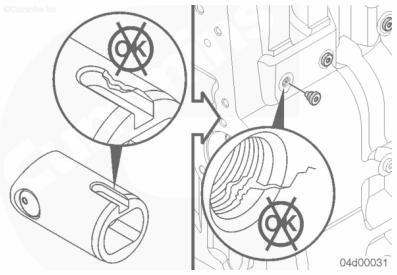
Inspect the roller for flat spots or pitting. See Service Bulletin, Camshaft Reuse Guidelines for Cummins® Engines with Roller Followers or Roller Tappets, Bulletin 3666052. (/qs3/pubsys2/xml/en/bulletin/3666052.html) If excessive wear is found, replace the tappet. Inspect the camshaft.



The roller **must** rotate freely. If it does **not**, replace the tappet.

Inspect the tappet body guide screw groove for damage.

If damage to the groove is found, remove the guide screw from the cylinder block.



Inspect the guide screw and guide screw hole for thread condition and cracks.

Note : Damage to the tappet body guide screw is **not** common.

Install the tappet guide screw. Tighten.

Torque Value: 10 n•m [89 in-lb]

Install

Lubricate the tappets with assembly lubricant, Part Number 3163087, or equivalent.

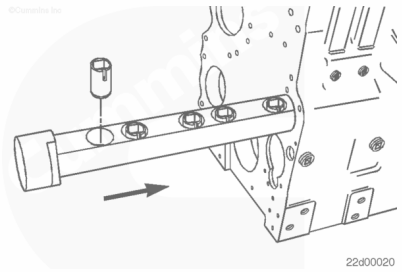
ANADOLU ISUZU AFTER SALES

Make sure the tappets are installed with the pin slots toward the outside of the block.

Insert the tappets into the tappet holder.

Note : If the tappets are being reused, be sure to install them in their original position.

Insert the tappet holder the full length of the camshaft bore.

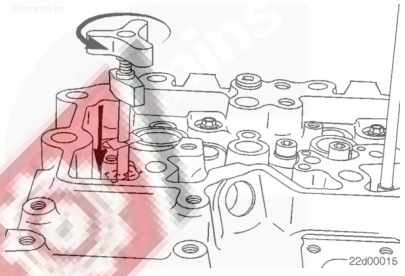


Insert the tappet extractor tool into the tappet bore. Turn the top **counterclockwise** to expand and secure the tool into the tappet.

Raise the tappet extractor until it stops. Push the metal tab down against the head surface to secure the tool in the up position.

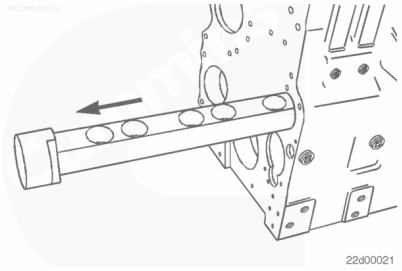
Note : Some manipulation can be necessary to get the tappet to enter the bore. When the tappet enters the bore, attempt to rotate the extractor while applying light upward pressure. If the tool will **not** rotate, the tappet has engaged the guide pin. If the tool does rotate, continue until the tappet engages the guide pin.

Repeat for the remaining tappets.

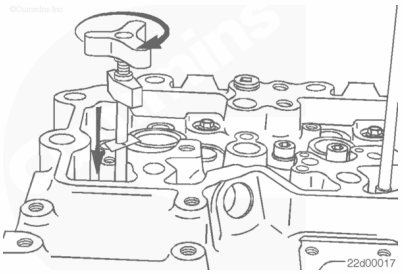


Remove the tappet holder.

Install the camshaft. Refer to Procedure 001-008 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-008.html)



Lower the tappet extractor. Seat the tappet into the camshaft. Turn the top knob **clockwise** while holding the bottom knob to disengage the extractor from the tappet. Repeat the step for the remaining tappets.



ANADOLU ISUZU AFTER SALES

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Install the rubber vibration damper, if required. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Install the viscous vibration damper, if required. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Install the push rods or tubes. Refer to Procedure 004-014 in Section 4. (/qs3/pubsys2/xml/en/procedures/425/425-004-014.html)
- Install the rocker levers. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Adjust the valves. Refer to Procedure 003-004 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-004-tr.html)
- Install the engine brake assembly, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Install the crankcase breather tube and drain tube. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

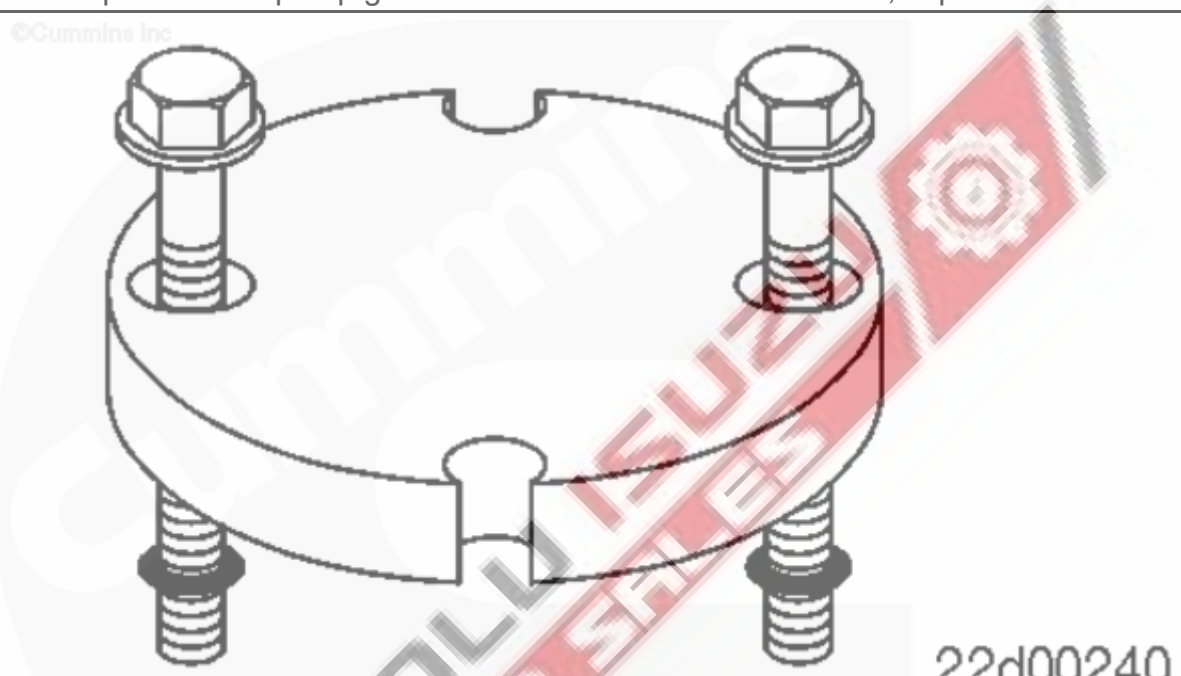
Fuel System

Tool Number

3163381

Fuel Pump Gear Puller

Used to pull the fuel pump gear. Includes Part Number 3900633, capscrews.

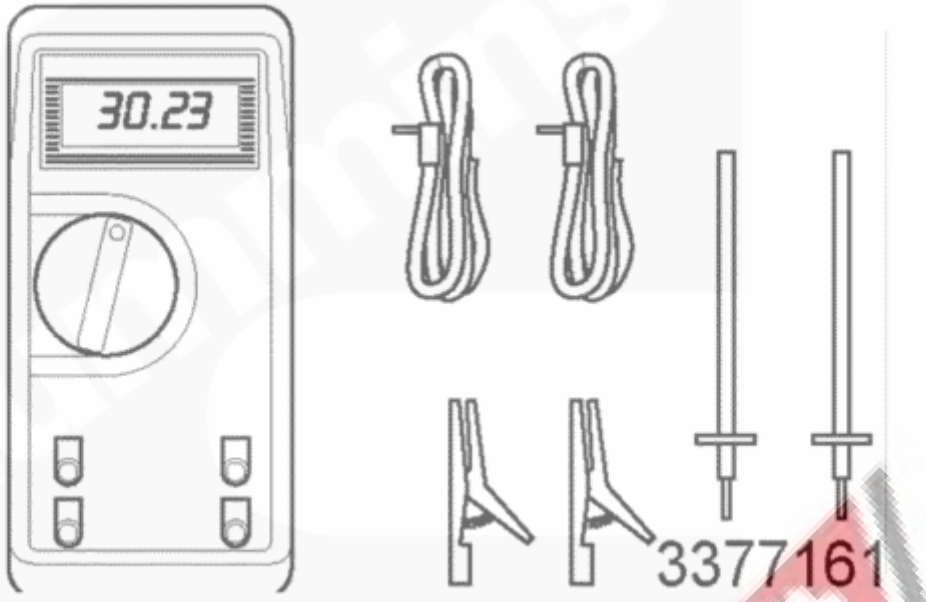


Tool Number

3164488

Multimeter

Used to measure voltage, resistance, and current in electrical circuits.

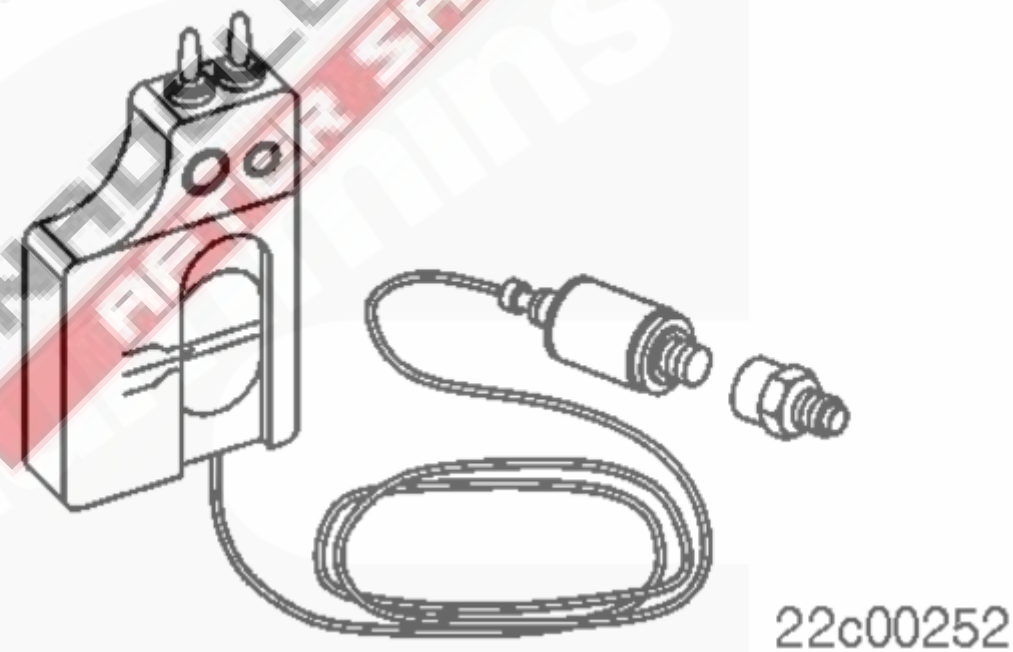


Tool Number

3164499

Pressure and Vacuum Module

Used with multimeter, Part Number 3164488, to measure pressures and restrictions in the fuel system.

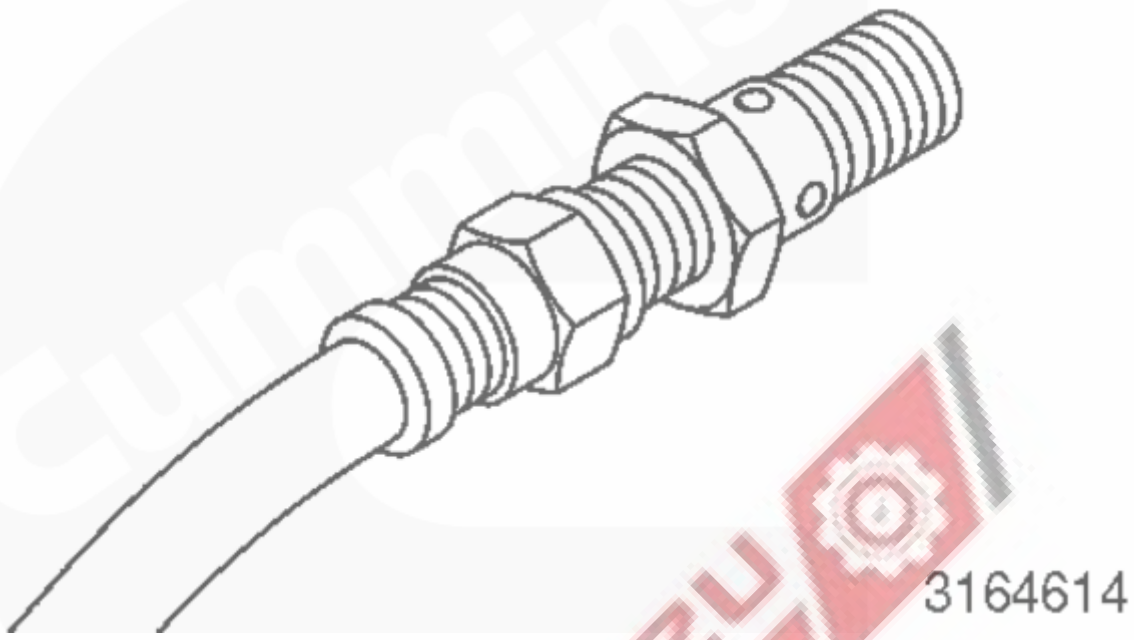


Tool Number

3164618

12 mm Banjo Adapter Fitting (Leakage Flow Adapter)

Used to isolate drain flow from the fuel drain lines where they connect to the fuel drain manifold. Allows fuel leakage measurement from the fuel pump, injector, or fuel rail pressure relief valve drain lines.

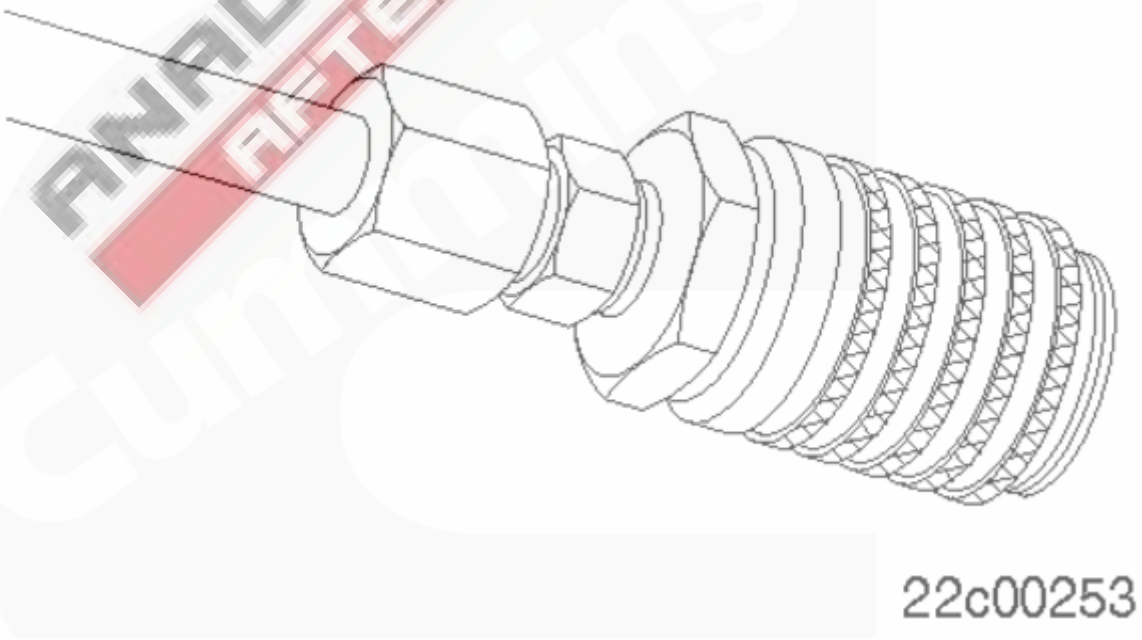


Tool Number

3164621

0.043-Inch Diagnostic Fuel Line

Used to create rated fuel flows through the low-pressure fuel system without loading the engine.

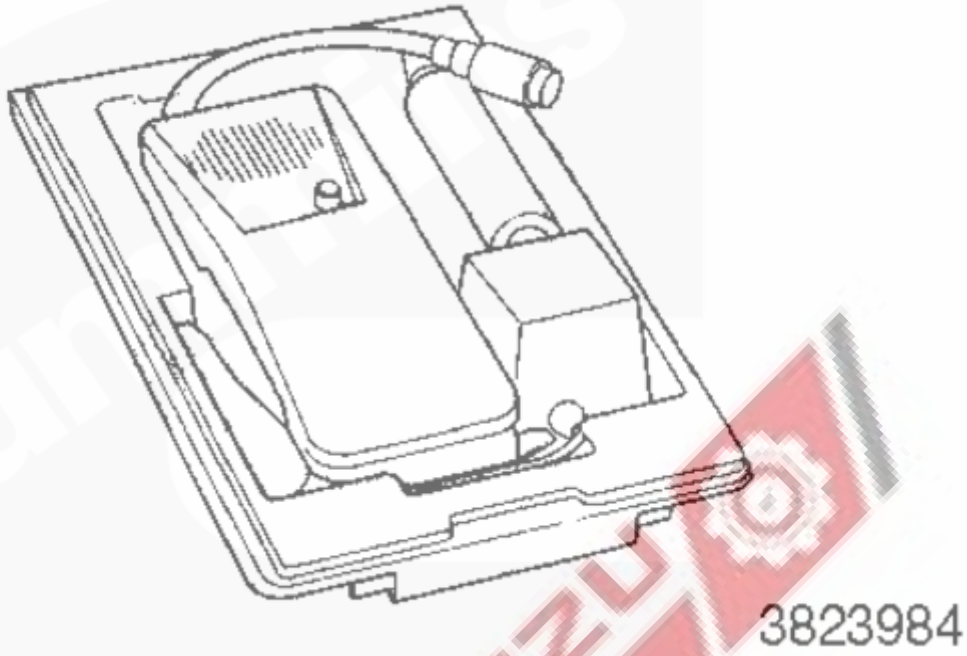


Tool Number

3823984

Combustible Gas Detector

Used to check for gas leaks at connections.



Tool Number

3824510

Electrical Contact Cleaner

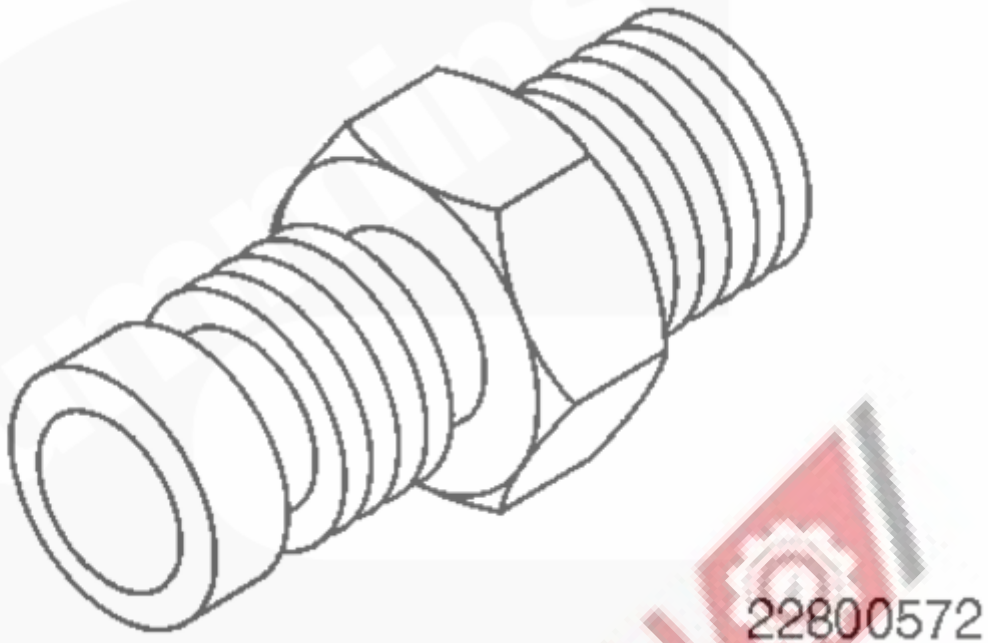
Non-petroleum cleaner used to clean electrical connections and fuel pump internal parts.

Tool Number

3824842

M10 Compucheck® Fitting

Used to measure fuel system pressure at the fuel filter head.

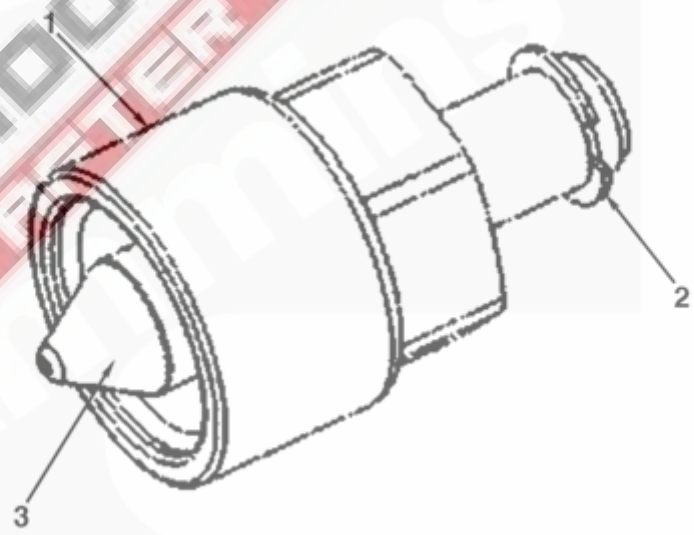


Tool Number

4918563

Fuel System Leak Tester

The tester is used to block off the high pressure fuel rail connections to detect faulty or leaking injectors and fuel connectors.

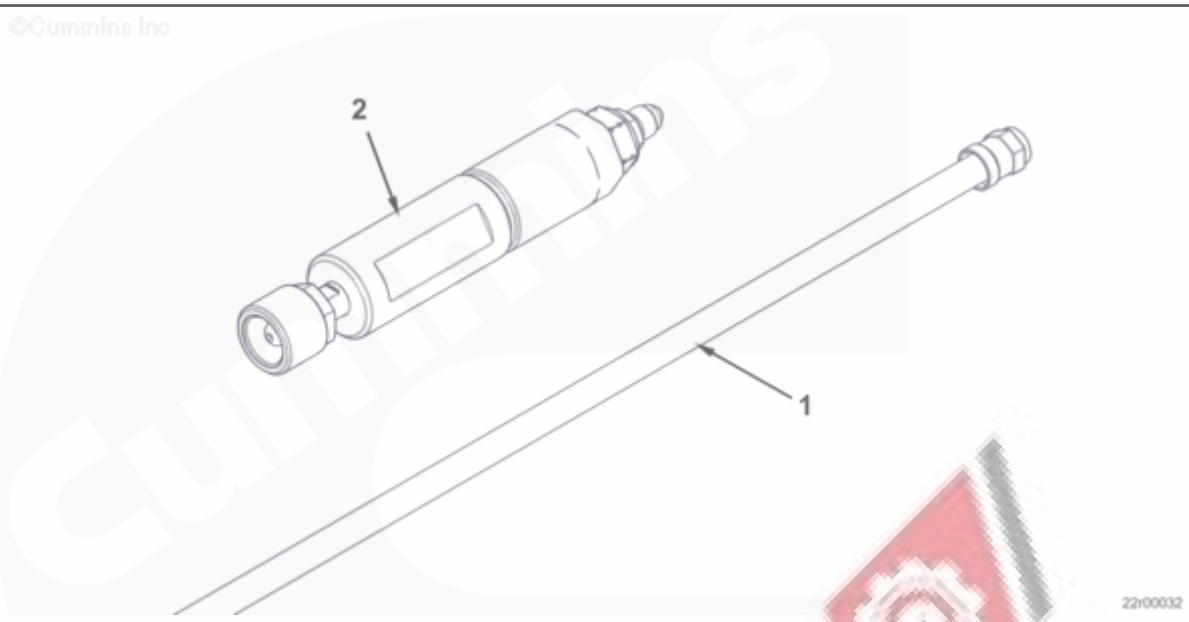


Tool Number

5299726

Fuel Pump Test Kit

Used to measure high pressure fuel pump pressure and volume output. Includes Part Number 3164673, Leak Test Hose (1) and Part Number 5299754, Fuel Pump Tester (2).



Tool Number

Not Applicable

1000 cc Graduated Cylinder

Used to measure high-pressure pump drain flow (leakage).

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

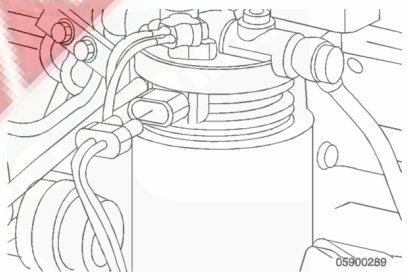
- Thread locker, Part Number 3375068, or equivalent

Additional Service Items

- No additional service items required.

Initial Check

The fuel heater is an optional device installed on the suction-side original equipment manufacturer (OEM)-supplied fuel filter head. It is held on the filter head by the threaded filter spud.

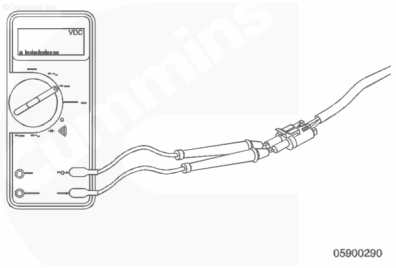


Note : The fuel heater is **not** controlled by the engine control module (ECM). A bimetallic switch on the filter head acts as a thermostat. The fuel heater will turn on at approximately 1°C [34°F] and turn off at approximately 18°C [65°F].

The switch should register as an open circuit above 18°C [65°F] and register as a closed circuit below 1°C [34°F].

Remove the 2 pin connector from the fuel heater.

Check for proper voltage to the fuel heater.



Note : Minimum voltage is 12 VDC with keyswitch ON (separate 24 volt heaters are used on vehicles with a 24 volt charging system).

If the voltage is **not** within specifications, see equipment manufacturer service information.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

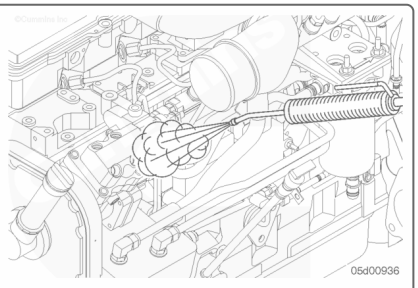
⚠ CAUTION ⚠

Drain the fuel-water separator into a container, and dispose of contents in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the OEM power supply connector from the fuel heater.
- Disconnect the engine harness connector from the water in fuel sensor. Refer to Procedure 019-127 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-127.html)
- Drain a small quantity of fuel from the filter water drain to reduce fuel spillage during filter removal.
- Remove the spin-on fuel filter. Refer to Procedure 006-015 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-015-tr.html)

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

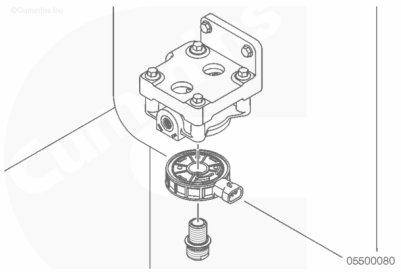
⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)

Remove

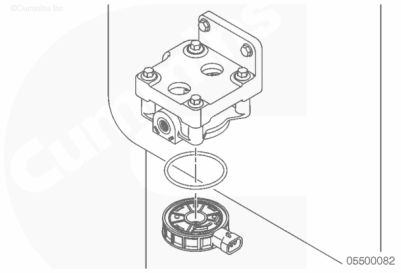
Remove the threaded filter spud and fuel heater.



Install

Install a new gasket onto the fuel heater.

Place the fuel heater, gasket side facing up, against the filter head with the electrical connector facing away from the engine block.

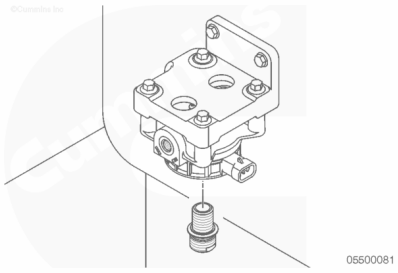


Apply thread locker, Part Number 3375068, or equivalent, to the filter spud threads where they will engage the filter head.

ANADOLU ISUZU AFTER SALES

Install the fuel filter spud.

Torque Value: 30 n•m [22 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fuel filter. Refer to Procedure 006-015 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-015-tr.html)
- Connect the fuel heater.
- Connect the water in fuel sensor. Refer to Procedure 019-127 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-127.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Recommended Cummins® Service Tools

- Contact cleaner, Part Number 3824510, or equivalent
- Fuel pump gear puller, Part Number 3824469

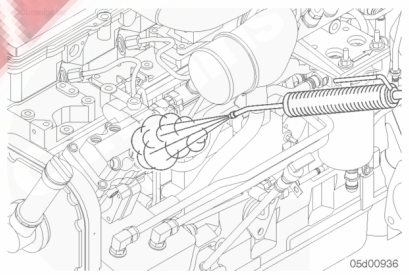
Additional Service Items

- Strap style filter wrench

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

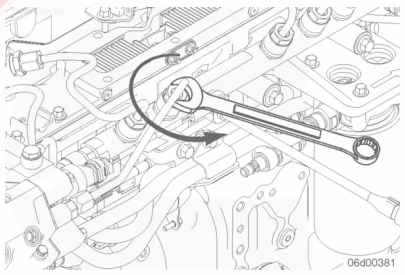
Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential

contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)
- Use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.



Before servicing the fuel system, loosen the pump to rail line at the rail to vent the pressure.

Keep hands clear of the line when loosening.

Tighten the fuel rail nut.

Torque Value: 65 n•m [48 ft-lb]

Note : A machined slot in this fitting directs the fuel spray towards the engine block.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce

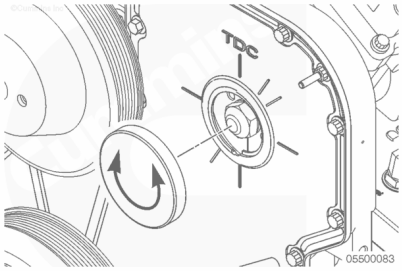
the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the fuel supply lines from the fuel pump. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Remove the fuel drain line from the fuel pump. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Disconnect the engine harness from the fuel pump actuator. Refer to Procedure 019-117 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-117.html)

Remove

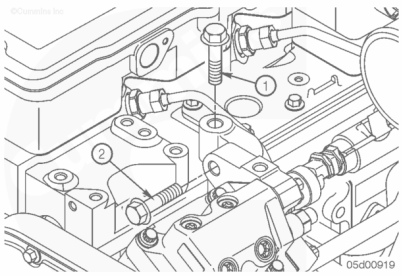
Note : The access cover is threaded and screws on and off. Use of a strap style filter wrench is recommended for removal to avoid damaging the cover.

- Remove the fuel pump gear access cover.

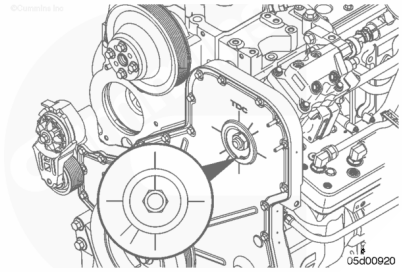


Remove the fuel pump upper support bracket by removing the two bolts (1) and (2).

The upper support bracket is located on the fuel pump actuator housing. Refer to Procedure 005-228 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-228.html)

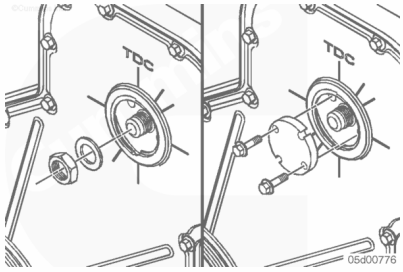


Locate top dead center (TDC) for cylinder Number 1 by barring the engine until the line on the fuel pump gear aligns with the front cover mark for TDC.



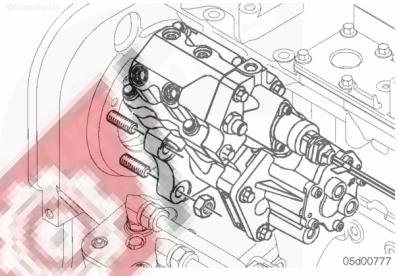
Remove the fuel pump gear nut and washer.

Use fuel pump gear puller, Part Number 3163381, to pull the fuel injection pump drive gear loose from the fuel pump drive shaft.



Remove the four mounting nuts that hold the fuel pump to the gear housing.

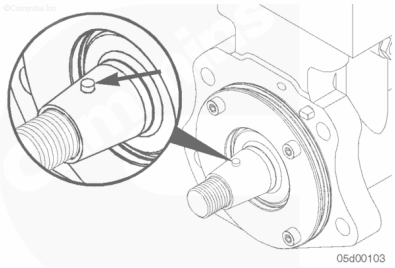
Remove the fuel pump.



Inspect for Reuse

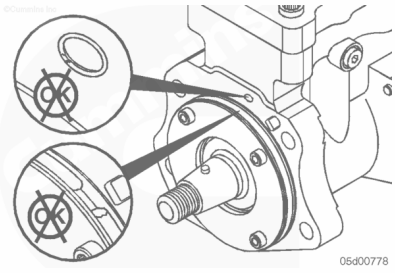
The dowel pin in the fuel pump drive shaft **must not** be sheared.

If the dowel is sheared, the camshaft housing or fuel pump **must** be replaced, and the drive gear **must** be replaced.



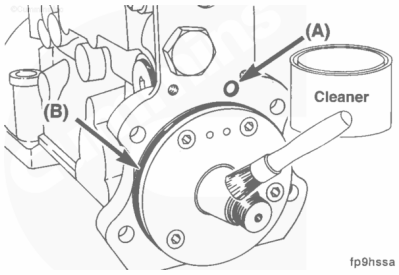
Make sure the pilot o-ring is **not** cut or otherwise damaged.

The pump oil supply o-ring **must** be replaced. Make sure it is **not** damaged.



Install

Make sure the engine is at Number 1 cylinder, TDC. The fuel pump gear timing mark **must** align with the TDC mark on the front cover.



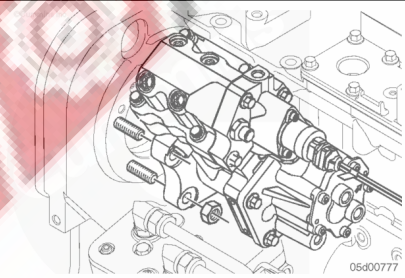
Make sure the o-ring seals for the oil feed orifice (A) and pilot (B) are installed correctly.

Lubricate the pilot o-ring (B). Use clean engine oil.

Clean the nose of the drive shaft and the fuel pump gear inside diameter. Use electrical contact cleaner, Part Number 3824510, or equivalent.

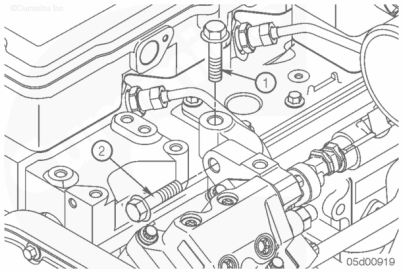
The fuel pump drive gear inside diameter and drive shaft outside diameter **must** be clean and dry before installing the gear.

Slide the fuel injection pump shaft through the drive gear/ Position the fuel injection pump flange onto the mounting studs.



Make sure the dowel pin in the drive shaft lines up with the keyway in the fuel injection pump gear.

Installation sequence for fuel pump actuator housing mounted support bracket:



1. Install the pump mounting nuts (leave loose).

2. Install the bolt to the cylinder head (1) and the bolt through the pump flange (2) into the support bracket (leave loose).

3. Tighten the pump mounting nuts.

Torque Value: 44 n•m [32 ft-lb]

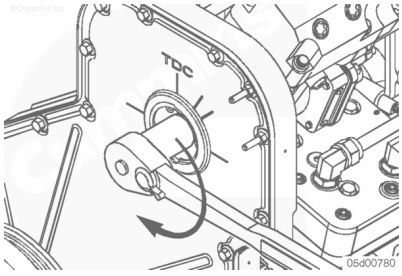
4. Tighten the bolt into the cylinder head (1).

Torque Value: 65 n•m [48 ft-lb]

5. Tighten the bolt into the pump flange (2).

Torque Value: 80 n•m [59 ft-lb]

Tighten the fuel injection pump drive gear nut.



Torque Value: 180 n•m [133 ft-lb]

Install the threaded access cover.

Torque Value: 10 n•m [89 in-lb]

Note : To avoid damage, Cummins Inc. recommends the use of a strap style filter wrench to install the

access cover.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fuel supply lines to the fuel pump. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Install the fuel drain line to the fuel pump. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Connect the wire harness to the fuel pump actuator. Refer to Procedure 019-117 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-117.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Preparatory Steps

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

ANADOLU ISUZU AFTER SALES

Note : All fuel system diagnostics procedures and component specifications have been moved. Refer to Procedure 005-236 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-236.html)

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)
- Use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

⚠ WARNING ⚠

Do not vent the fuel system on a hot engine; this can cause fuel to spill onto a hot exhaust manifold, which can cause a fire.

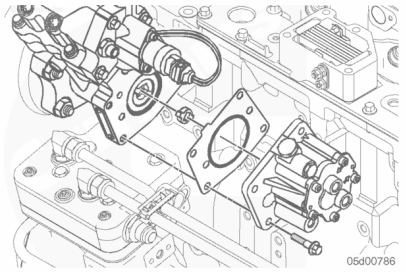
- Disconnect the batteries. See equipment manual service information.
- Clean any fuel, oil, and debris from the gear pump.
- Remove the fuel supply lines from the gear pump. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)

Remove

Remove the four bolts that hold the gear pump to the fuel pump.

Remove the drive coupling if it remains attached to the rear of the fuel pump camshaft.

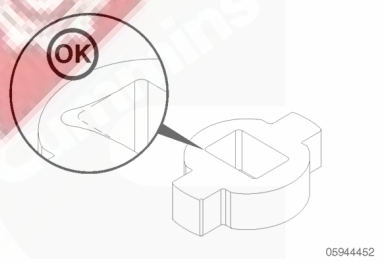
Remove the gear pump gasket.



Clean and Inspect for Reuse

Note : Gear pump coupling wear is normal. The gear pump should **not** be replaced due to coupling or shaft wear.

Inspect the gear pump for damage.



Install

Install the drive coupling into the back of the high-pressure pump camshaft.

Insert the mounting bolts through the gear pump flange.

Install a new gasket onto the bolts.

Index the gear pump input shaft to engage the drive coupling and install the gear pump.

Install the four gear pump bolts. Tighten.

Torque Value: 34 n•m [25 ft-lb]

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

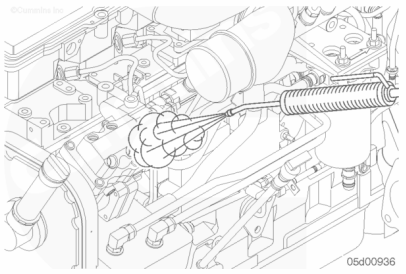
⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Remove the fuel pump camshaft nut. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

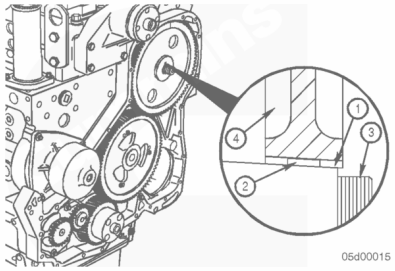
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing any fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)

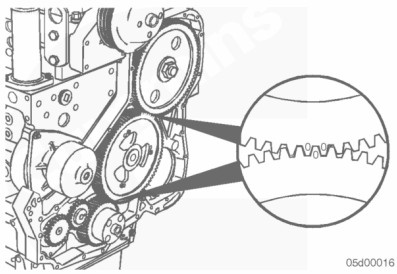
Inspect for Reuse

Check that the fuel pump camshaft alignment dowel is present in the fuel pump drive gear keyway. If the alignment dowel is **not** visible, remove the injection pump, determine the cause of misalignment, and repair or replace any damaged components.

1. Fuel pump gear keyway
2. Fuel pump timing dowel pin
3. Fuel pump camshaft
4. Fuel pump gear.



If this inspection is being performed due to a performance complaint, and the problem first occurred after gear train removal and replacement, then check the timing of the camshaft gear to the crankshaft gear and the camshaft gear to the fuel pump drive gear. Refer to Procedure 001-012 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-012.html)



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install and tighten the injection pump camshaft nut. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)
- Install the front gear cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Last Modified: 27-Jul-2016

Select Service Tools

Recommended Cummins® Service Tools

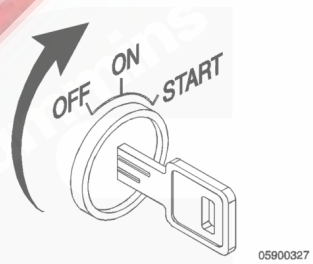
- Electrical contact cleaner, Part Number 3824510, or equivalent

Additional Service Items

- No additional service items required.

Initial Check

A malfunctioning electric fuel lift pump can cause slow engine starts or can result in an engine failing to start. The fuel lift pump can be cleaned and repaired to a limited extent.

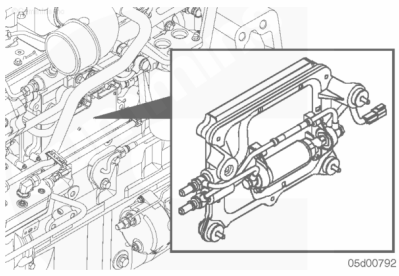


The lift pump will operate for 30 seconds when the key is switched ON. The lift pump will also operate while the engine is cranking.

Refer to Procedure 019-397 in Section 19 (/qs3/pubsys2/xml/en/procedures/425/425-019-397.html) for information on checking the fuel lift pump circuit.

General Information

A lift pump is mounted to the back of the engine control module (ECM) mounting plate.



A bypass check valve in the ECM mounting plate makes sure the system is primed by the lift pump. This check valve opens under vacuum created by the gear pump, once the engine is started. High vacuum measured between the electric lift pump and the gear pump can indicate this check valve has become plugged.

The ECM mounting plate check valve is integral with the lower (outlet) fitting of the ECM mounting plate.

Preparatory Steps

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

The fuel pump, high-pressure fuel lines, and fuel rail contain very high-pressure fuel. Do not loosen any fittings while the engine is running. Wait at least 10 minutes after shutting down the engine before loosening any fittings in the high-pressure fuel system to allow pressure to decrease to a lower level.

⚠ CAUTION ⚠

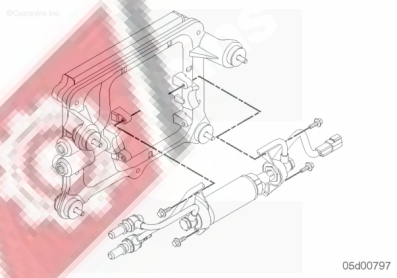
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

- Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which can expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the electric fuel priming pump from the engine wiring harness.
- Remove the fuel supply lines. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Remove the ECM mounting plate. Refer to Procedure 001-103 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-103.html)

Remove

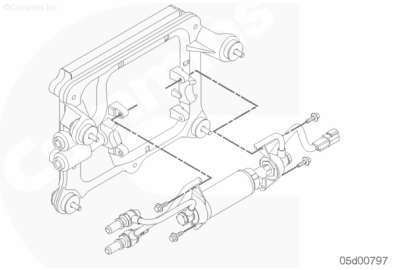
Remove the electric lift pump from the ECM mounting plate.



Install

Note : The ECM mounting plate check valve **must** be free of debris and installed into the lower ECM mounting plate port (outlet port).

Note : Hold the fuel lines, as illustrated, so they can **not** come into contact with each other or the engine block.



Install the electric lift pump to the ECM mounting plate.

Tighten the mounting capscrews.

Torque Value: 10 n•m [89 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery

cable last.

- Install the ECM mounting plate to the engine block. Refer to Procedure 001-103 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-103.html)
- Install all fuel supply lines. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

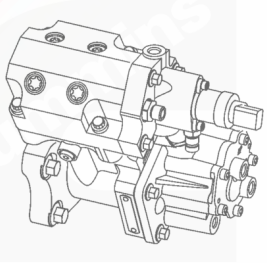
Additional Service Items

- Allen wrench
- Assembly lubricant, or equivalent

General Information

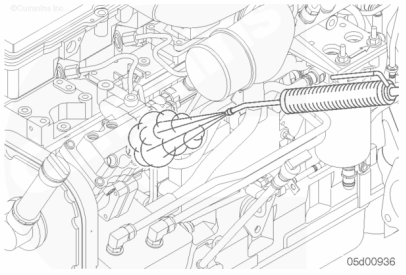
This procedure references the Cummins® Common Rail fuel system.



Preparatory Steps

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

ANADOLU ISUZU AFTER SALES

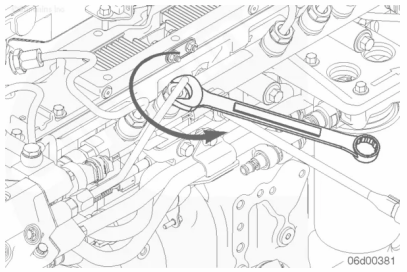
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)
- Use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.



Note : A machined slot in this fitting directs the fuel spray towards the engine block.

Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure.

Keep hands clear of the line when loosening.

Tighten the fuel rail nut.

Torque Value: 65 n•m [48 ft-lb]

⚠ WARNING ⚠

The fuel pump, high-pressure fuel lines, and fuel rail contain very high-pressure fuel. Do not loosen any fittings while the engine is running. Wait at least 10 minutes after shutting down the engine before loosening any fittings in the high-pressure fuel system to allow pressure to decrease to a lower level.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris or dirt can cause personal injury.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

⚠ WARNING ⚠

Do not vent the fuel system on a hot engine; this can cause fuel to spill onto a hot exhaust manifold, which can cause a fire.

- Disconnect the batteries. See equipment manufacturer service information.
- Thoroughly clean the entire fuel pump. Dry the fuel pump with compressed air.
- Close the fuel supply valve. See equipment manufacturer service information.
- Remove the high-pressure fuel line from the fuel pump actuator housing. Refer to Procedure 006-051 in

Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Remove the fuel drain line from the actuator housing. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Remove the fuel supply line from the fuel pump actuator housing. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Remove the fuel pump actuator housing from the high-pressure fuel pump. Refer to Procedure 005-228 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-228.html)

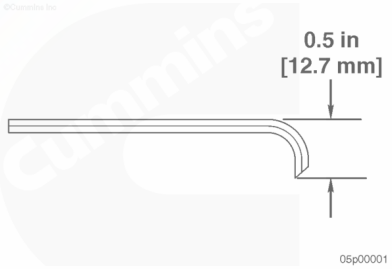
Remove

Removal of a “flat washer”

The flat sealing washer is swaged into the inlet fitting bore duing installation.

A special tool can be created to aid in its removal by grinding a 45 degree angle on the short leg of a 1/8 inch or 3/16 inch Allen wrench, so the wrench is no longer than 13 mm [1/2 in] long (measured from the outside of the long leg).

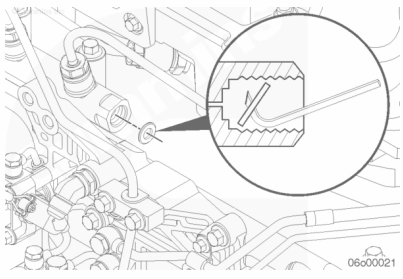
This tool acts as a mini heel bar to pry out the sealing washer without damaging the back of the hole.



Remove the fuel pump head outlet fitting.

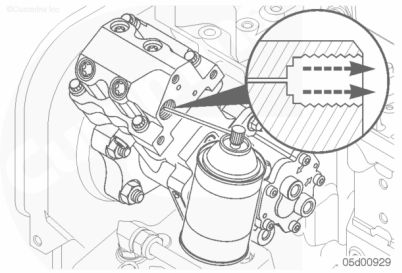
Pry out the old sealing washer from the threaded hole in the back of the high-pressure pump head using the modified Allen wrench.

Note : Considerable force is required to remove the sealing washer.



Clean and Inspect for Reuse

Clean the threaded hole in the high-pressure pump head. Use electrical contact cleaner, Part Number 3824510, or equivalent.



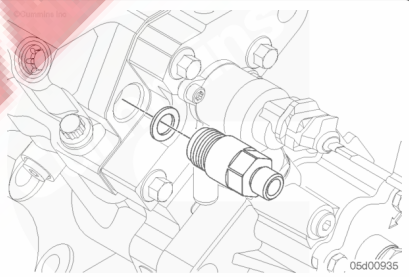
Inspect the threads and cavity in the high-pressure pump head for burrs or debris.

Inspect the seal washer end of the outlet fitting. There should be a polished crown free of nicks or inclusions. If the crown is damaged or severely flattened, the male union **must** be replaced.

Clean any burrs with a wire brush, then flush the bore clean.

Install

Note : This joint is designed to seal in excess of 179,264 kPa [26,000 psi]. Seal washers **must not** be reused.



Install a new seal washer onto the outlet fitting. The seal washer should pilot into the outlet fitting. A small amount of clean grease, such as assembly lubricant, will help in keeping the seal attached to the outlet fitting during installation.

Torque Value:

1. 13.6 n•m [120 in-lb]
2. Rotate 90 degrees.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fuel pump actuator housing to the high-pressure fuel pump. Refer to Procedure 005-228 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-228.html)
- Install the high-pressure fuel line to the fuel pump actuator housing. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)

- Install the fuel drain line to the actuator housing. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Install the fuel supply line to the fuel pump actuator housing. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Open the fuel supply valve. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.
- Perform several throttle snaps so increased fuel rail pressure will be developed.

Last Modified: 27-Jul-2016

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Contact cleaner, Part Number 3824510, or equivalent

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

Depending on the circumstances, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of fire and resulting severe personal injury, death or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Note : Use the following procedure for all fuel system diagnostic procedures and component specifications. Refer to Procedure 005-236 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-236.html)

- Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.
- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

Note : A machined slot in this fitting directs the fuel spray toward the engine block.

- Before servicing the fuel system, loosen the pump to rail line at the rail to vent the pressure.
- Keep hands clear of the line when loosening.
- Tighten the fuel rail nut.

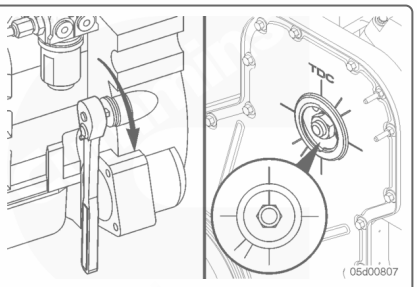
- Disconnect the batteries. See equipment manufacturer service information.
- Remove the high-pressure fuel line from the high-pressure pump. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Remove the fuel drain line from the fuel pump actuator housing. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Remove the fuel supply line from the fuel pump actuator housing. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Disconnect the wiring harness from the fuel pump actuator.
- Remove the fuel pump actuator housing. Refer to Procedure 005-228 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-228.html)

Remove

Note : The drive gear cover is threaded.

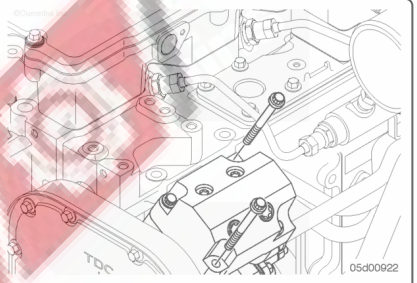
Remove the fuel pump drive gear cover.

Locate top dead center (TDC) for cylinder number 1 by barring the engine slowly until the line on the pump gear lines up with the line on the gear cover.



⚠ CAUTION ⚠

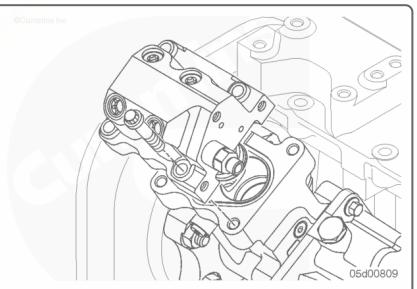
Do not use air tools. The use of air tools will possibly damage the fuel pump.



Remove two of the four capscrews located diagonally from one another.

Remove the last two capscrews. Alternately loosen the capscrews to avoid binding. Loosen each capscrew one turn at a time.

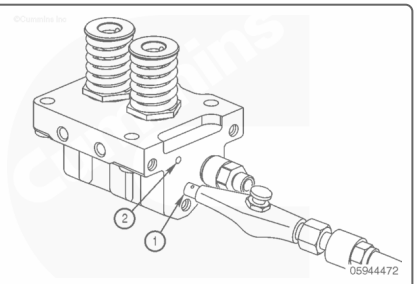
Carefully lift the fuel pump head from the camshaft housing, being careful to keep the tappet springs attached to the pump head. Place the head on a clean surface.



Clean and Inspect for Reuse

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



Special care **must** be taken to make sure these parts are kept extremely clean, if removed. Cover the camshaft housing with a clean shop towel while the head is removed.

Do **not** use cleaning agents, other than contact cleaner, on pump components.

Note : Do **not** perform the following test without the springs and spring retainers installed.

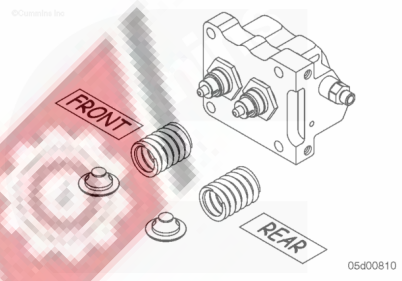
1. Drain
2. Inlet.

With the springs and spring retainers installed, blow compressed air (at least 276 kPa [40 psi]) into the inlet (2).

The plungers should extend to the tappet spring retainers. If the pumping plungers are stuck and do **not** extend to the tappet spring retainers, replace the fuel pump head.

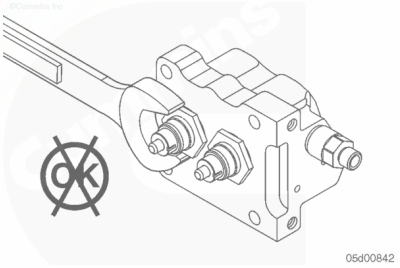
Remove the springs and spring retainers from the barrel retainers.

Make certain to keep track of which spring came from the front and rear. It is recommended these parts be installed in the same location, even if a new high-pressure pump head is installed.



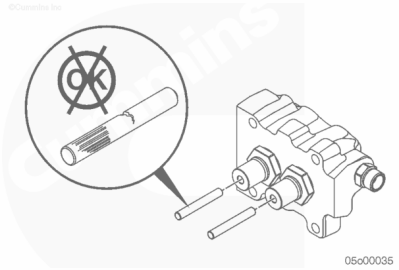
⚠ CAUTION ⚠

Do not remove the barrel retainers. Damage to the pump head and barrel retainers will result.



⚠ CAUTION ⚠

Each plunger must be installed in the same orientation and in the same barrel, or engine damage can result. Marking the bottoms of the plungers with a felt tip marker will help to make sure correct orientation is maintained.

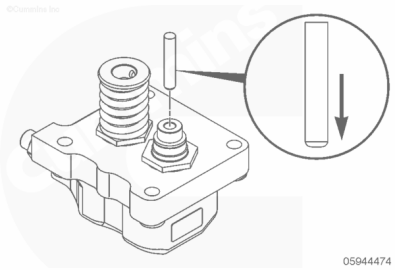


Remove and inspect the plungers. Slight discoloration can be evident. Deep scoring **must not** be present. If scoring or scratches exist that can be felt, the fuel pump head **must** be replaced.

Install the plungers into the barrel retainers.

Note : Some fuel pump heads are built with non-symmetric pumping plungers. The crowned end of the pumping plunger must be installed into the barrel. If

the plunger is installed in the wrong orientation, fuel pump head damage will result.



Use finger pressure to test the plunger action.

- Press the plunger halfway into the barrel quickly, with a pumping motion.
- Release it quickly.

If the check valves in the fuel pump head are good, the trapped air will cause the plunger to bounce or rebound. If the plunger falls to the bottom, one of the check valves in the fuel pump head may be damaged.

While the fuel pump head is removed, inspect the camshaft housing. The tappets can be removed. Use an o-ring pick as the removal tool.

Inspect the tappet guide pins and tappet guide pin grooves for excessive wear. If more than 25 percent guide pin or groove wear is observed, the fuel pump **must** be replaced.

Normal operation creates vertical grooves in the cylinder bores of the fuel pump camshaft housing. These grooves are **not** an indication of a malfunction.

Camshaft housings with grooves are acceptable for reuse.

With the camshaft housing tappets removed, inspect the camshaft for wear.

Inspect the tappet rollers for wear.

Normal operation creates bands around the circumference of the tappet roller. These bands are **not** an indicator of a malfunction. Tappet rollers with bands are acceptable for reuse.

If damage to the camshaft, tappets, or camshaft housing is observed, it is possible the fuel pump is **not** receiving adequate lubricating oil. When replacing the fuel pump, inspect the gear housing to make sure no blockages exist in the oil supply to the fuel pump.

Install

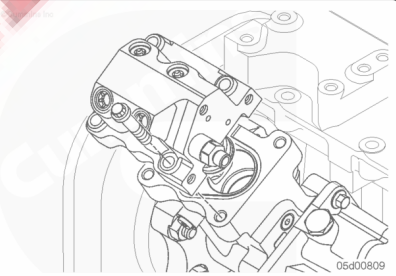
Install the tappets in the original tappet bores.

Make certain the tappets are installed in the original locations.

Make certain the tappet guide pins engage the guide pin grooves.

Install new fuel pump head o-rings onto the camshaft housing.

If installing a new or rebuilt pump head, install the new tappet springs and retainers provided with the pump head.



Place the high-pressure pump head onto the high-pressure pump camshaft housing.

Draw the high-pressure pump head down by alternately tightening the four high-pressure pump head capscrews until the head just contacts the camshaft housing.

Tighten the four high-pressure pump head capscrews to the final torque.

Torque Value: 68 n•m [50 ft-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fuel pump actuator housing. Refer to Procedure 005-228 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-228.html)
- Connect the high-pressure fuel supply line. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Connect the fuel drain line to the fuel pump actuator housing. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Connect the fuel supply line to the fuel pump actuator housing. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Connect the engine harness to the fuel pump actuator.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Note : Use the following procedure for all fuel system diagnostic procedures and component specifications. Refer to Procedure 005-236 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-236.html)

- Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.
- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

Note : A machined slot in this fitting directs the fuel spray toward the engine block.

- Before servicing the fuel system, loosen the pump to rail line at the rail to vent the pressure.
- Keep hands clear of the line when loosening.
- Tighten the fuel rail nut.

Torque Value: 65 n.m [48 ft-lb]

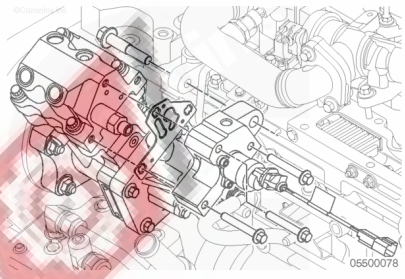
- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the wire harness from the fuel pump actuator.
- Disconnect the fuel supply line from the fuel pump actuator housing. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Remove the high-pressure fuel line from the high-pressure pump actuator housing. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Remove the fuel drain line from the fuel pump actuator housing. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)

- Disconnect the wiring harness from the fuel pump actuator. Refer to Procedure 019-117 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-117.html)
- Remove the upper support bracket from the fuel pump actuator bracket. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)

Remove

Remove the three bolts that hold the fuel pump actuator housing to the high-pressure fuel pump head.

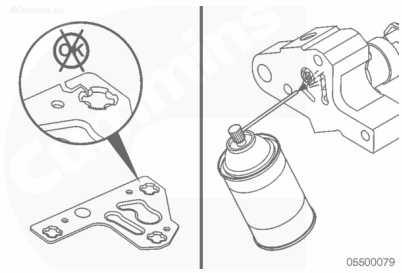
Remove the fuel pump actuator housing and the gasket.



Clean and Inspect for Reuse

Inspect the fuel pump actuator housing gasket. Do **not** reuse the gasket if the material is cracked, torn, or otherwise damaged.

Make sure the mounting surfaces of the high-pressure pump head and fuel control valve adapter block are clean. Use contact cleaner to clean these surfaces.



Install

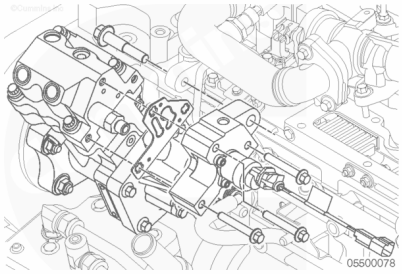
Insert the three mounting bolts through the fuel pump actuator housing.

Install the gasket over the bolts. The gasket **must** be installed dry.

Install the actuator housing.

Tighten the mounting bolts.

Torque Value: 34 n•m [25 ft-lb]



ANADOLU ISUZU
PARTS

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the upper support bracket. Refer to Procedure 005-016 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-016.html)
- Connect the high-pressure fuel line to the fuel pump. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Connect the fuel supply line to the fuel pump. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Connect the fuel drain line to the fuel pump. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Connect the wire harness to the fuel pump actuator. Refer to Procedure 019-117 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-117.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU FUEL AFTER SALES

Last Modified: 12-Aug-2019

Select Service Tools

Recommended Cummins® Service Tools

- M10 male Comuchek™ fitting, Part Number 3824842
- Orificed diagnostic fuel line, Part Number 3164621
- Adapter fitting, Part Number 3932302
- 1/8 NPT male Compuchek™ fitting, Part Number 3377244

Additional Service Items

- No additional service items required.

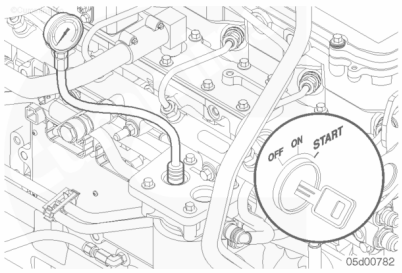
General Information

If the engine has been allowed to run out of fuel or the fuel system has been serviced or repaired, it will be necessary to prime the fuel system.

Prime

⚠ WARNING ⚠

High pressure fuel spray can cause serious injury or death.



Install M10 male Compuchek™ fitting, Part Number 3824842, on the engine fuel filter head inlet port.

To assist in fuel system priming and removing air from the fuel system, orificed diagnostic fuel line, Part Number 3164621, can be used to bleed air from the low-pressure fuel system.

Install the orificed diagnostic fuel line to the Compuchek™ fitting at the inlet to the pressure-side fuel filter.

Note : If there is **not** enough clearance to install the 1.0922 mm [0.043 in] orificed diagnostic fuel line, Part Number 3164621, adapter fitting, Part Number 3932302, and 1/8 NPT male Compuchek™ fitting,

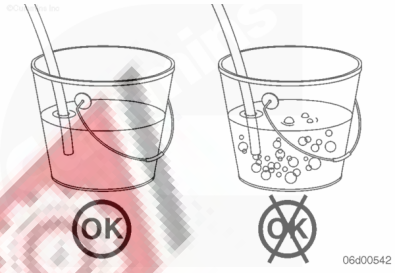
ANADOLU ISUZU PARTS SALES

Part Number 3377244, can be used to aid accessibility.

Turn the keyswitch to the ON position. Do **not** start the engine. Allow the priming pump to run. Observe the orificed diagnostic fuel line. When a solid stream of fuel exits the line, the initial priming process is complete. It can be necessary to repeat this process two or three times.

Remove the diagnostic fuel line

Note : The engine can possibly run rough for several minutes until the air is out of the system.



Note : If the air is **not** properly purged from the fuel system, the engine will be difficult to start, but will run smoothly once it starts. If the engine is shut OFF, it will be difficult to restart.

Start the engine. Allow it to stabilize.

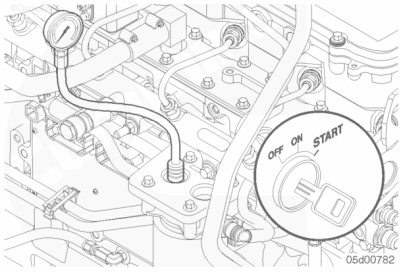
Attach diagnostic fuel line, Part Number 3164621, to the Compuchek™ fitting at the inlet to the pressure-side fuel filter.

Shut the engine OFF. bserve the orificed diagnostic fuel line. Allow the entrapped air to expand and exit through the diagnostic fuel line. Repeat this process up to four times, or until air no longer exits the diagnostic fuel line.

Note : Remove the orificed diagnostic fuel line prior to starting the engine. The engine will be difficult to start if the orificed diagnostic fuel line is installed during starting.

If air continues to exit the diagnostic fuel line after four or more repetitions, check the suction-side of the fuel system for leaks. Refer to Procedure 006-003 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-003.html)

Note : If the air is **not** properly purged from the fuel system, the engine will be difficult to start, but will run smoothly once it starts. If the engine is shut OFF, it will be difficult to restart.



If the engine will **not** start, attach diagnostic fuel line, Part Number 3164621, to the Compuchek™ fitting at the inlet to the pressure-side fuel filter. Crank the engine for 15 seconds.

Note : Crank the engine in 15 second intervals with a 15 second break between cranking. This reduces the possibility of overheating the starter motor.

Stop cranking the engine. Observe the orificed diagnostic fuel line. Allow the entrapped air to expand and exit through the diagnostic fuel line. Repeat this process up to four times or until the engine starts.

If air continues to exit the diagnostic fuel line after four or more repetitions, check the suction-side of the fuel system for leaks. Refer to Procedure 006-003 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-003.html)

- 1/8 inch NTP pipe.

General Information

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.

⚠ CAUTION ⚠

Do not engage the starter motor for more than 30 seconds at a time. Allow 2 minutes between cranking intervals.

⚠ CAUTION ⚠

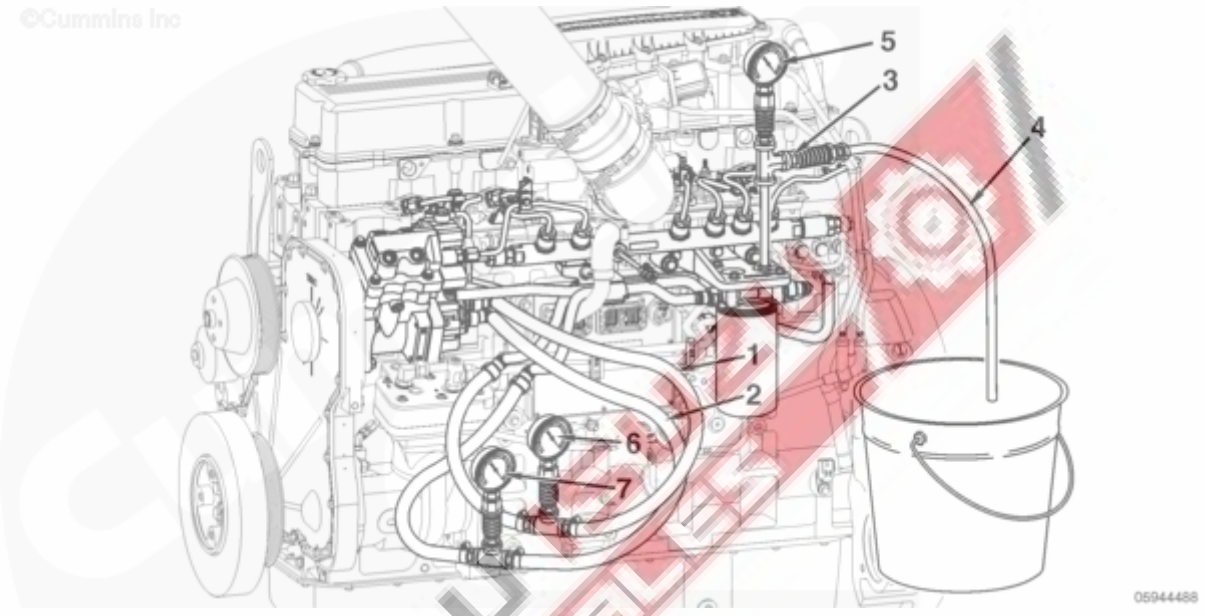
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

PHABOLU ISUZU DEALER SALES

The following procedure contains measurement steps and specifications for the engine fuel system components.

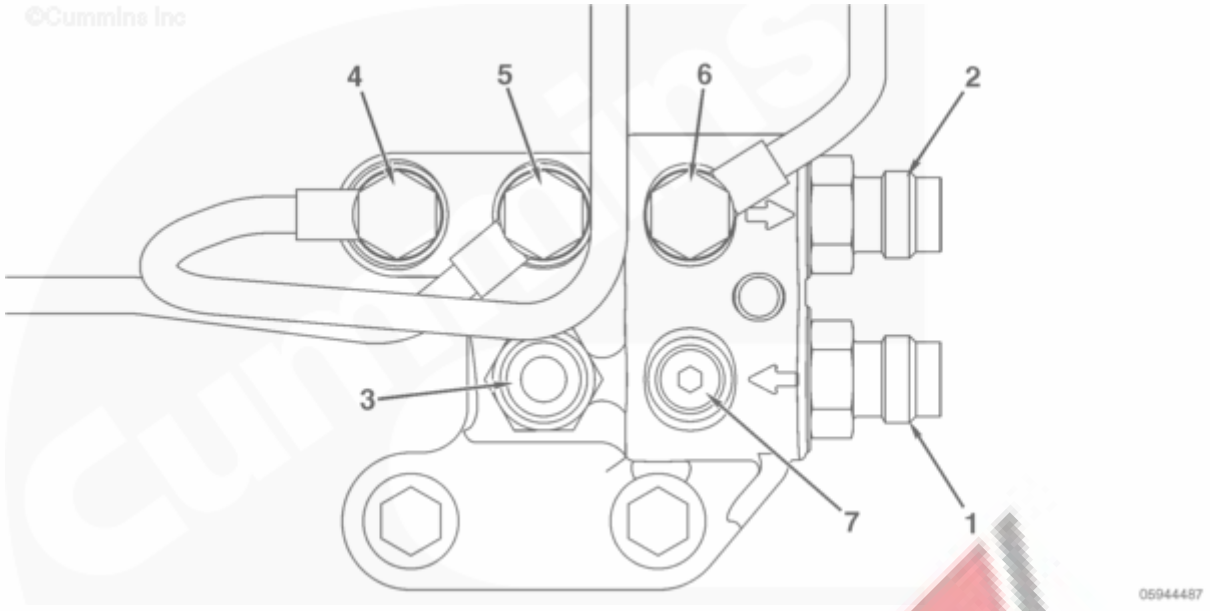
Note : This procedure is **not** intended to take the place of the troubleshooting tree repair directions. Use the appropriate troubleshooting tree for repair directions.

The diagrams below are intended to supplement the setup instructions in this procedure. See the appropriate setup section for step by step instructions.



Engine Will Start - Engine Mounted Filter

1. Diagnostic fuel line, Part Number 4918895
2. Diagnostic fuel line, Part Number 4918895
3. "T" adapter fitting
4. Diagnostic fuel line 0.043 inch orificed, Part Number 3164621
5. Pressure gauge 0 to 1034 kPa [0 to 150 psi]
6. Vacuum gauge 0 to 762 mm-hg [0 to 30 in-hg]
7. Pressure gauge 0 to 1034 kPa [0 to 150 psi].



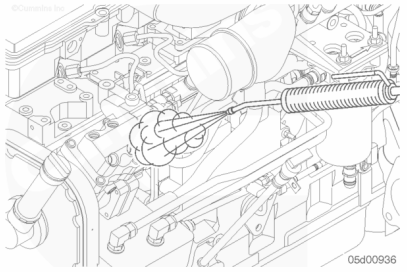
Fuel Return Manifold

1. Original equipment manufacturer (OEM) inlet
2. OEM return
3. To transfer pump
4. Pressure relief valve return flow
5. Pump head return flow
6. Injector return flow (can also check drain line restriction here)
7. Unused port (can also check OEM inlet restriction here).

Preparatory Steps

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of

fire and resulting severe personal injury, death, or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.

⚠ WARNING ⚠

Do not bleed the fuel system of a hot engine; this can result in fuel spilling onto a hot exhaust manifold, which can cause a fire.

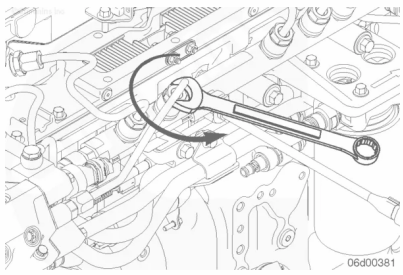
⚠ CAUTION ⚠

Clean the connector fittings to remove as much debris as possible. It is very important that extra care is taken to keep the fuel system connections clean during removal and installation. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are not cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** enter the fuel system.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.



- Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure. Keep hands clear of

the line when loosening. Tighten the fuel rail nut once pressure has been released.

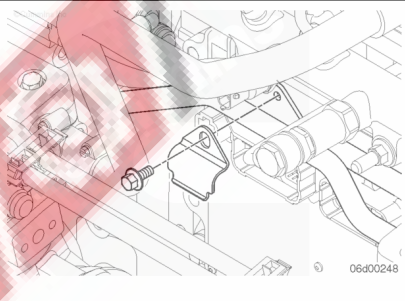
Torque Value: 65 n•m [48 ft-lb]

Note : A machined slot in this fitting directs the fuel spray toward the engine block.

Low-Pressure System Check

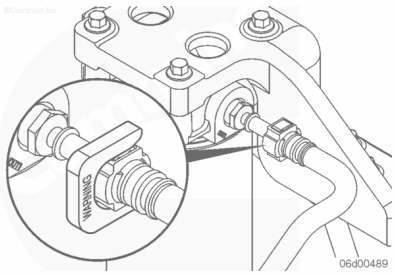
Initial Setup

The low-pressure system check is designed to help troubleshoot the low-pressure side fuel system using one setup to take multiple fuel system checks. This procedure is optimized for engines with engine-mounted pressure side filter. See supplementary diagrams in the general section of this procedure to view setup differences.



- Remove the clasp from the fuel line brace. This will allow the fuel lines to move so test equipment can be installed properly.

- Disconnect the quick disconnect style fuel lines from the gear pump inlet and outlet by pressing in the locking tangs on both sides of the quick disconnect fitting OR slide the removal tool, Part Number 4918878, over the locking tangs.

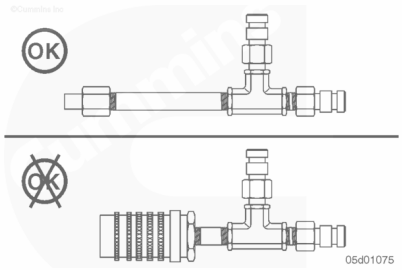


Note : Make sure the tool is removed from the fuel line as soon as possible after the line has been disconnected. Inadvertently leaving the tool in place can result in fuel leaks.

- To aid in removal, a screwdriver can be inserted between the fuel line end and the quick disconnect male union. After pressing the opposing locking tangs, twisting the flat blade of the screwdriver helps to remove the fuel line.

- Construct a "T" adapter fitting using one adapter fitting, Part Number 3932302 (M10 to 1/8-inch NPT adapter), a 1/8 inch NTP pipe (of appropriate length for application), a 1/8 inch NPT “T” fitting, and two 1/8 inch NPT Compuchek™ fittings, Part Number 3042618

Note : Do **not** use female Compuchek™ fitting, Part Number 3376859, when constructing the “T” adapter. If female Compuchek™ fitting, Part Number 3376859, is used, pressure readings will be inaccurate.



For Engine Will Start

1. Install one diagnostic fuel line (1), Part Number 4918895, between the gear pump fuel supply line and the gear pump inlet (upper fuel line fitting).
2. Install the second diagnostic fuel line (2), Part Number 4918895, between the gear pump outlet and the pressure side fuel filter fuel supply line (lower fuel line fitting).
3. Install the “T” adapter fitting (3) at the outlet port of the pressure side fuel filter.
4. Install a 0.043 inch orificed diagnostic fuel line (4), Part Number 3164621. Insert the fuel hose into the fuel tank or into a fuel collection device. This diagnostic line is used to simulate operating the engine at rated fuel system flow rate.
5. Install a 0 to 1034 kPa [0 to 150 psi] pressure gauge (5) at the "T" adapter fitting at the outlet of the fuel filter head.
6. Attach a 0 to 762 mm-hg [0 to 30 in-hg] vacuum gauge (6) on the diagnostic fuel line, Part Number 4918895, connected at the gear pump inlet.
7. Install a 0 to 1034 kPa [0 to 150 psi] pressure gauge (7) at the Compuchek™ fitting on diagnostic fuel line, Part Number 4918895, connected at the gear pump outlet.

Start the engine and allow it to operate at high idle for 3 minutes, or until the air is purged from the newly installed diagnostic fuel lines.

Note : If the engine is difficult to start after installing the diagnostic fuel lines, it may be necessary to cycle the fuel lift pump three or four times in order to purge the air out of the fuel system prior to starting. Refer to Procedure 005-234 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-234-tr.html)

Note : If the engine is **not** equipped with an engine-mounted pressure side fuel filter, diagnostic fuel line, Part Number 4918895, can **not** be installed at the gear pump outlet. To measure the pressure drop

across a remote-mounted pressure side fuel filter, install a second pressure gauge at the inlet port of the fuel filter head instead. See supplementary diagrams in the general section of this procedure to view setup differences.

For Engine Will Not Start

1. Fully prime the system. Refer to Procedure 005-234 (/qs3/pubsys2/xml/en/procedures/425/425-005-234-tr.html) in Section 5.
2. Install a Compuchek™ fitting (to the outlet port of the filter head. The “T” adapter fitting can also be used).
3. Install a 0 to 1034 kPa [0 to 150 psi] pressure gauge at the outlet of the fuel filter head.

Measurement - Engine Will Start

Air in Fuel

- Refer to Procedure 006-003 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-003.html)

Inlet Restriction

- Refer to Procedure 006-020 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-020.html)

Fuel Gear Pump Pressure and Fuel Filter Restriction

- Operate the engine until it is at operating temperature.
- Operate the engine at high idle for 5 minutes.
- Record the fuel pressure at the inlet and outlet of the fuel filter.
- Subtract the outlet reading from the inlet reading to determine the restriction.
- Observe the gear pump pressure at the filter outlet.

Fuel Filter Restriction		
kpa		psi
69	MAX	10

Fuel Pump Gear Pump Pressure Engine Operating at High Idle 1800 rpm (Fuel Filter Inlet)		
kpa		psi
552	MIN	80

ANADOLU ISUZU TRUCK SALES

Fuel Pump Gear Pump Pressure Engine Operating at High Idle 1800 rpm (Fuel Filter Outlet)		
kpa		psi
483	MIN	70

Measurement - Engine Will Not Start

Air in Fuel

- Refer to Procedure 006-003 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-003.html)

Fuel Lift Pump Pressure

- Install a 0 to 345 kPa [0 to 50 psi] pressure gauge at the Compuchek™ fitting on the diagnostic fuel line, Part Number 4918895.
- Activate the fuel lift pump by turning the keyswitch ON. The fuel lift pump will run for 30 seconds and then stop. Repeat if necessary.
- Measure the fuel lift pump pressure. See graphic for the convoluted tube's (1) location on the fuel lift pump.

Fuel Lift Pump Pressure Requirements		
Fuel Lift Pump Convoluted Tube Color	**kPa (min)**	**Psi (min)**
Red or Blue	138	20
Yellow or Black	55	8

If the fuel lift pump pressure is greater than specified, the fuel lift pump is functional.

If the fuel lift pump pressure is less than specified, the fuel lift pump is malfunctioning. Replace the fuel lift pump.

Fuel Gear Pump Pressure

- Verify lift pump is working and there is flow to the gear pump. Refer to fuel lift pump pressure check.
- Remove the 0.043 inch orificed diagnostic fuel line, Part Number 3164621.
- Crank engine. Make sure engine cranking speed is at least 150 rpm.

- Monitor the gear pump pressure at the outlet port of the filter head, while the engine is cranking.

Gear Pump Pressure at Cranking (with Fuel Lift Pump assist)		
kpa		psi
173	MIN	25

Gear Pump Pressure at Cranking (without Fuel Lift Pump Assist)		
kpa		psi
105	MIN	15

Note : Crank the engine in 15 second intervals with a 15 second break between intervals. This reduces the possibility of overheating the starter motor.

Note : Some vehicles are equipped with an Engine Starting Motor Protection feature. If the starting motor is engaged for 30 or more seconds, without the engine starting, the starting motor will be locked out from operating, allowing for proper cooling of the starting motor. During this time the Wait to Start lamp, if equipped, will flash for 2 minutes. Once the lamp discontinues flashing, the starting motor will be allowed to function again.

High-Pressure System Leak Down Test

Note : This test can **not** be performed if the engine will **not** start.

The high-pressure system check is designed to troubleshoot the high-pressure side of the fuel system by determining if there is a leak in the system.

- Operate the engine to operating temperature.
- Begin INSITE™ electronic service tool Fuel System Leakage Test.
- Allow pressure to stabilize.
- Select “Data Monitor/Logger” > ”All Parameters” > “Fuel Rail Pressure Measured” and monitor the fuel rail pressure.
- Turn the keyswitch to the OFF position. Wait for the engine to stop, and turn the keyswitch ON quickly,

without starting the engine.

- Monitor the fuel rail pressure decay rate for 1 minute.
- A change in fuel pressure greater than 1500 bar [21756 psi] in 1 minute is an indication of a high-pressure fuel system leak.

High-Pressure Fuel Pump Performance Test

Initial Setup

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump-to-rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.

⚠ WARNING ⚠

High pressure fuel spray can cause serious injury or death.

⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of fire and resulting severe personal injury, death, or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.

Note : If the low-pressure fuel system is degraded or the fuel pressure relief valve leakage is out of specification, this test will **not** provide accurate results.

Note : Troubleshoot the low-pressure system and any high-pressure fuel system leakage before performing this test.

Before servicing the high-pressure fuel system, loosen the pump-to-rail line at the rail to vent the pressure.

When loosening the nut, keep hands clear of the line.

Tighten the fuel rail nut.

Torque Value: 65 n•m [48 ft-lb]

Note : A machine slot in this fitting directs the fuel spray toward the engine.

⚠ WARNING ⚠

When servicing the engine, do not use a remote starter switch or other means that would engage the starting motor to rotate the engine on a high-pressure common rail engine. Using the starter motor can create highly pressurized fuel in the fuel system. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death. Use a hand barring tool to rotate the engine for servicing the engine. Always loosen the pump-to-rail fuel line at the rail to vent the pressure after rotating the engine. Keep hands clear of the line when loosening and wear appropriate eye protection.

⚠ CAUTION ⚠

Do not install the isolation tool at the high-pressure pump outlet fitting. Severe engine damage will result. This tool must only be installed at the fuel rail for the purpose of isolating the high-pressure fuel supply from individual injectors.

This test requires five leak test isolation tools, Part Number 4918563.

Block off five injectors at the fuel rail in place of the high-pressure fuel line. Keep the injector line supply port that is most accessible unblocked.

Torque Value: 65 n•m [48 ft-lb]

Before installation, use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly flush any residual fuel and/or debris from the high-pressure fuel pump service tool, Part Number 5299754.

Install the high-pressure fuel pump service tool, Part Number 5299754, from Fuel Pump Performance Test Kit, Part Number 5299726, at the unblocked fuel rail connection.

Note : Cranking speed **must** be above 130 rpm. If necessary, use a battery charger to maintain proper cranking speed.

Note : Units equipped with starter lockout features may require additional cranking aids.

Measurement

Note : Do **not** crank the engine for 30 seconds continuously. Crank the engine in intervals with a 15 second pause between intervals. This reduces the possibility of overheating the starting motor.

- With the following conditions met:
  - Connect fuel drain line, Part Number 3164673, to high-pressure fuel pump service tool, Part Number 5299754.
  - Disconnect the fuel pump actuator from the electrical harness.
  - Disconnect the injector pass-through harness from the engine wiring harness.
  - Route the hose, Part Number 3164673, into a graduated beaker, Part Number 4919139, for measurement.
  - Connect INSITE™ electronic service tool.Log engine speed and fuel rail pressure with INSITE™ electronic service tool.
- Perform initial air purge - no measurements required.
- Crank until fuel flow exits the hose making sure air has been purged or for a maximum of 15 seconds.
- If no fuel flow exists after three 15 second crank cycles, measure the fuel pressure relief valve return flow while performing the High-Pressure Fuel Pump Performance Test. Follow the Fuel Pump Pressure Relief Performance Test in this procedure.
  - Remove the service tool and use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly flush any residual fuel and/or debris from the high-pressure fuel pump service tool.
  - Install the high-pressure fuel pump service tool and crank until the fuel exits the hose or for maximum of 15 seconds.
  - If no fuel exits the hose after three 15 seconds crank cycles, high-pressure service tool, Part Number 5299754, is **not** working properly and **must** be replaced.
  - If the fuel pressure relief valve return flow is in specification, inspect the fuel pump head. Refer to Procedure 005-227 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-227.html)

Note : After completing the test, fuel may still be contained in the drain line. Make sure to empty the line into the measuring container to obtain a proper measurement.

Flow from the service tool is directly related to engine speed.

Use the graph to determine the minimum flow from the service tool.

- Engine speed can be found on the horizontal axis.
- Service tool flow in milliliters can be found on the vertical axis.

If the measured fuel flow from the high-pressure fuel pump service tool at the recorded engine speed is in the upper region of the graph, the fuel pump is functioning properly.

If the measured fuel flow from the high-pressure fuel pump service tool at the recorded engine speed is in the lower region of the graph, the fuel pump is **not** functioning properly and **must** be replaced.

If the measured flow is in the gray area of the graph:

- Check to make sure the correct specifications are being used.
- Verify proper high-pressure fuel pump service tool installation.
- Make sure there are no external leaks.
- Verify all low-pressure system checks were made. Perform the High-Pressure Fuel Pump Performance Test again.

If the test readings are still in the gray area, the fuel pump head **must** be removed and the fuel pump camshaft and fuel pump camshaft tappet rollers **must** be inspected. If the fuel pump passes the inspection, contact technical support.

- Remove the test equipment.
- Use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly flush any residual fuel from the high-pressure fuel pump service tool, Part Number 5299754.
- Install the fuel injector supply lines. Refer to Procedure 006-060 in Section 6.
- Connect the fuel pump actuator to the electrical harness.
- Connect the injector pass-through harness to the engine wiring harness.

Note : Do **not** disassemble the high-pressure fuel pump service tool, Part Number 5299754.

High-Pressure Fuel Rail Return Flow Test

Initial Setup

⚠ CAUTION ⚠

Installation of the banjo flow adapter at any place other than the recommended locations can cause damage to high-pressure fuel system components.

Return fuel is routed from the injectors, the fuel rail pressure relief valve, and the fuel pump head through three different drain lines. The measurement of fuel pressure relief valve leakage requires use of fuel return flow hose, Part Number 3164618. This tool is used to isolate the leakage from just the fuel pressure relief valve, so leakage can be measured in a graduated cylinder.

⚠ WARNING ⚠

The fuel pump, high-pressure fuel lines, and fuel rail contain very high-pressure fuel. To reduce the possibility of personal injury, never loosen any fittings while the engine is running.

- Remove the M12 banjo bolt that connects the fuel pressure relief valve drain line to the fuel drain manifold.
- Install fuel return flow hose, Part Number 3164618, at the fuel drain manifold.
- Insert the fuel return flow hose into a collection device.

- Alternatively, fuel return flow hose (fuel pressure relief valve), Part Number 3164617, can be installed at the fuel pressure relief valve.

Torque Value: : 16.8 n•m [148 in-lb]

Measurement - Engine Will Start

⚠ CAUTION ⚠

Fuel is at high-pressure during this test. After connecting the test fitting, close the engine cover and stand clear of high-pressure fuel lines.

- Operate the engine until it is at operating temperature.
- Begin INSITE™ Fuel System Leakage Test.
- Count the number of drops from the fuel return hose within 60 seconds.

Maximum High-Pressure Fuel Rail Return Flow (Engine Operating)	
Drops	Seconds
30	60

Measurement - Engine Will Not Start

⚠ CAUTION ⚠

Fuel is at high-pressure during this test. After connecting the test fitting, close the engine cover and stand clear of high-pressure fuel lines.

- Crank the engine for 30 seconds.
- Count the number of drops from the fuel return hose within 30 seconds.

Maximum High-Pressure Fuel Rail Return Flow (Engine Cranking)	
Drops	Seconds
5	30

Note : Do **not** crank the engine for 30 seconds continuously. Crank the engine in 15 second intervals with a 15 second break between cranking. This reduces the possibility of overheating the starter motor.

Note : Some vehicles are equipped with an Engine Starting Motor Protection feature. If the starting motor is engaged for 30 or more seconds, without the engine starting, the starting motor will be locked out from operating, allowing for proper cooling of the starting motor. During this time the Wait to Start lamp, if equipped, will flash for 2 minutes. Once the lamp discontinues flashing, the starting motor will be allowed to function again.

Cutout Test

Perform a manual cutout test that will **not** start.

- With the engine **not** operating, disconnect the fuel line routed from the fuel rail to cylinder number 1. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Install the injector leakage isolation tool.

Torque Value: 65 n•m [48 ft-lb]

Attempt to start the engine or operate the engine at idle.

Repeat the above test, as necessary, with each cylinder blocked off.

High-Pressure Injector Return Flow Test

Initial Setup

⚠ CAUTION ⚠

Installation of the banjo flow adapter at any place other than the recommended locations can cause damage to high-pressure fuel system components.

Return fuel is routed from the injectors, the fuel rail pressure relief valve, and the fuel pump head through three different drain lines. The measurement of fuel injector leakage requires use of fuel return flow hose, Part Number 3164618. This tool is used to isolate the leakage from the injectors, so leakage can be measured in a graduated beaker.

Obtain a graduated beaker marked in cubic centimeters or milliliters, Part Number 4919139, or equivalent.

⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of fire and resulting severe personal injury, death, or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.

- Remove the M12 banjo bolt that connects the fuel injector drain line to the fuel drain manifold.
- Install M12 fuel return hose, Part Number 3164618, at the fuel drain manifold.
- Route the fuel return hose into a collection device.

Measurement - Engine Will Start

⚠ CAUTION ⚠

Fuel is at high-pressure during this test. After connecting the test fitting, close the engine cover and stand clear of high-pressure fuel lines.

- Connect INSITE™ electronic service tool.
- Operate the engine until it is at operating temperature.

- Allow the engine to idle with fuel flowing into a collection container.
- Begin the INSITE™ Fuel System Leakage Test and allow the engine to operate at high-pressure for AT LEAST 1 minute.
- Use a graduated cylinder to collect fuel flow from the injector drain for EXACTLY 1 minute.
- IMMEDIATELY return the injector drain hose into collection container.
- After recording the fuel leakage quantity, stop INSITE™ High-Pressure Leakage Test and turn the keyswitch to OFF.

High-Pressure Fuel Injector Return Flow Specification (Engine operating)	
Maximum leakage in 1 minute	120 ml/cc

Note : Fuel temperature and fuel type will influence this measurement. For example; as the engine is warmed up and the injectors become hot, the leakage rate will increase. Also, low viscosity fuels, such as kerosene, will cause the leakage rate to increase. The above specification is correct for on-highway diesel fuels where fuel inlet temperature is less than 49°C [120°F].

Note : Make sure a steady flow of fuel is present at the drain line before beginning the measurement. Air in the line and movement of the hose during measurement can result in inaccurate measurements.

Measurement - Engine Will Not Start

- If the engine will **not** start, the injector return flow **must** be measured while engaging the starter for 30 seconds at a time.
- The leakage should **only** be a few drops. If leakage is greater than a few drops, an injector or a high-pressure connector is leaking.

Note : Do **not** crank the engine for 30 seconds continuously. Crank the engine in 15 second intervals with a 15 second break between cranking. This reduces the possibility of overheating the starter motor.

Note : Some vehicles are equipped with an Engine Starting Motor Protection feature. If the starting motor is engaged for 30 or more seconds, without the

engine starting, the starting motor will be locked out from operating, allowing for proper cooling of the starting motor. During this time the Wait to Start lamp, if equipped, will flash for 2 minutes. Once the lamp discontinues flashing, the starting motor will be allowed to function again.

Initial Setup - Injector Isolation

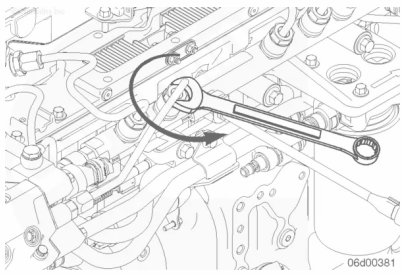
⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.

If injector drain flow is excessive, it will be necessary to isolate the injector(s) or fuel connector(s) that are damaged or worn. A loose fuel connector retaining nut results in a poor seal at the interface between the fuel connector and the injector. This loose condition will result in a leak of high-pressure fuel to the injector drain.

- Verify first that the fuel connectors are properly tightened. Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)
- If loose retaining nut(s) are found, test for leakage after tightening the retaining nut(s).

- Before servicing the fuel system, loosen the pump to rail line at the rail to vent the pressure. Keep hands clear of the line when loosening. Tighten the fuel rail nut, once pressure has been released.



Torque Value: 65 n•m [48 ft-lb]

Note : A machined slot in this fitting directs the fuel spray toward the engine block.

⚠ CAUTION ⚠

Do not install the isolation tool at the high-pressure pump outlet fitting. Severe engine damage will result. This tool must only be installed at the fuel rail for the purpose of isolating the high-pressure fuel supply from individual injectors.

⚠ CAUTION ⚠

Make certain the keyswitch is in the OFF position (Engine will Not Start) when loosening or tightening high-pressure fuel lines.

- Use leak test isolation tool, Part Number 4918563, or equivalent, to isolate excessive fuel drain from injectors or fuel connectors.

- Isolate the injector and fuel connector for each cylinder by installing the isolation tool at the fuel rail in place of the high-pressure fuel line that supplies the fuel connector.
- Tighten the isolation tool.

Torque Value: 65 n•m [48 ft-lb]

Measurement - Injector Isolation

- Record the amount of fuel flow from the injector drain line in 1 minute while the engine is operating. Use INSITE™ electronic service tool High-Pressure Leakage Test. If the engine will **not** start, drain flow **must** be measured while engaging the starter for 30 seconds.
- Do this up to six times, once while each line is isolated.
- If isolating a single injector and the high-pressure fuel connector causes the leakage to decrease significantly compared to the rest of the set, that injector and fuel connector **must** be inspected.

Injector Inspection: Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

Fuel Connector Inspection: Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)

Note : Do **not** crank the engine for 30 seconds continuously. Crank the engine in 15 second intervals with a 15 second break between cranking. This

reduces the possibility of overheating the starter motor.

Note : Some vehicles are equipped with an Engine Starting Motor Protection feature. If the starting motor is engaged for 30 or more seconds, without the engine starting, the starting motor will be locked out from operating, allowing for proper cooling of the starting motor. During this time the Wait to Start lamp, if equipped, will flash for 2 minutes. Once the lamp discontinues flashing, the starting motor will be allowed to function again.

Note : Make sure a steady flow of fuel is present at the drain line before beginning the measurement. Air in the line and movement of the hose during measurement can result in inaccurate measurements.

High-Pressure Fuel Pump Return Flow Test

Initial Setup

⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of fire and resulting severe personal injury, death, or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.

⚠ CAUTION ⚠

Installation of the banjo flow adapter at any place other than the recommended locations can cause damage to high-pressure fuel system components.

This fuel pump head leakage test uses a flow adapter fitting. The purpose of the flow adapter fitting is to route the drain flow of the fuel pump **only** into a collection device so that leakage may be measured.

Obtain a graduated cylinder marked in cubic centimeters or milliliters, graduated beaker Part Number, 4919139, or equivalent.

Note : The pump drain line connects at the center connection point on the fuel drain manifold.

- Remove the banjo bolt from the fuel pump drain line at the fuel drain manifold.
- Install banjo flow adapter, Part Number 3164618, at the fuel drain manifold and insert the hose into a bucket or the vehicle fuel tanks.

Alternate Test Setup

- If the drain manifold is **not** easily accessed, a M14 banjo can be attached at the pump head drain port with a fuel hose that is routed to the collection container.
- In this setup, a 12 x 1.5 banjo screw and cap, Part Number 4918295, is required to prevent fuel from flowing backward and leaking from the unused drain line. This kit also includes fuel hose to be routed into collection container.

⚠ CAUTION ⚠

The high-pressure leakage test in INSITE™ electronic service tool will cause the engine to operate at elevated pressures while the engine idles. The engine noise will change when this test is being performed due to the higher fuel injection pressures. Safety glasses should be worn while working near the operating engine. Fuel lines should not be adjusted while performing this test.

Close the engine cover(s) while performing these tests.

Measurement - Engine Will Start

- Connect INSITE™ electronic service tool.
- Operate the engine until operating temperature is reached.
- Allow the engine to idle with fuel flowing into a collection container.
- Begin the INSITE™ Fuel System Leakage Test and allow the engine to operate at high-pressure for AT LEAST 1 minute.
- Use a graduated cylinder to collect the fuel pump return flow for EXACTLY 30 seconds.

- IMMEDIATELY return the injector drain hose into collection container.
- After recording the fuel leakage quantity, stop INSITE™ High-Pressure Leakage Test and turn the keyswitch to OFF.

Minimum High-Pressure Fuel Pump Return Flow (Engine Operating)	
ml/cc	Seconds
50	30

Note : This specification is valid for engines operating on diesel fuels. Low fuel viscosity will increase the leakage rate; for example, kerosene or aviation fuels will result in excessive leakage. Verify the fuel type before replacing a fuel pump head for excessive leakage.

Measurement - Engine Will Not Start

- Turn the keyswitch ON. Allow the fuel lift pump to complete the cycle. After the cycle is completed, begin cranking the engine until fuel exits the drain line.
- When fuel begins to exit the drain line, route the drain flow to a graduated cylinder and continue cranking for 30 seconds.

Maximum High-Pressure Fuel Pump Return Flow (Engine Cranking)	
ml/cc	Seconds
320	30

Note : Do **not** crank the engine for 30 seconds continuously. Crank the engine in 15 second intervals with a 15 second break between cranking. This reduces the possibility of overheating the starter motor.

Note : Some vehicles are equipped with an Engine Starting Motor Protection feature. If the starting motor is engaged for 30 or more seconds, without the engine starting, the starting motor will be locked out from operating, allowing for proper cooling of the starting motor. During this time the Wait to Start lamp, if equipped, will flash for 2 minutes. Once the lamp discontinues flashing, the starting motor will be allowed to function again.

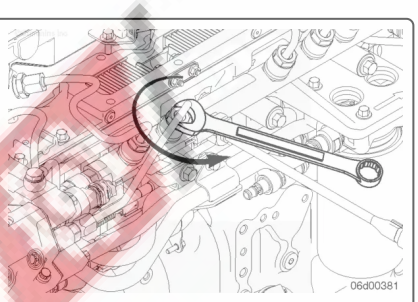
High-Pressure Fuel Pump Supply Flow Test

Initial Setup

Obtain a graduated cylinder marked in cubic centimeters or milliliters, graduated beaker, Part Number 4919139, or equivalent.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.



- Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure. Keep hands clear of the line when loosening. Tighten the fuel rail nut, once pressure has been released.

Torque Value: 65 n•m [48 ft-lb]

Note : A machined slot in this fitting directs the fuel spray toward the engine block.

- Disconnect the high-pressure fuel line from the rail.
- Clamp a hose to the end of the fuel line.
- Route a hose from the test fitting into a clean graduated cylinder.

Measurement

- Crank the engine for 30 seconds. Make sure engine cranking speed is at least 150 rpm.
- If there is no flow, verify that the vehicle has been fully primed.

Minimum High-Pressure Fuel Pump Supply Flow

Minimum High-Pressure Fuel Pump Supply Flow	
ml/cc	Seconds
75	30

Note : Do **not** crank the engine for 30 seconds continuously. Crank the engine in 15 second intervals with a 15 second break between cranking. This reduces the possibility of overheating the starter motor.

Note : Some vehicles are equipped with an Engine Starting Motor Protection feature. If the starting motor is engaged for 30 or more seconds, without the engine starting, the starting motor will be locked out from operating, allowing for proper cooling of the starting motor. During this time the Wait to Start lamp, if equipped, will flash for 2 minutes. Once the lamp discontinues flashing, the starting motor will be allowed to function again.

Finishing Steps

- Start the engine. Check for proper operation.

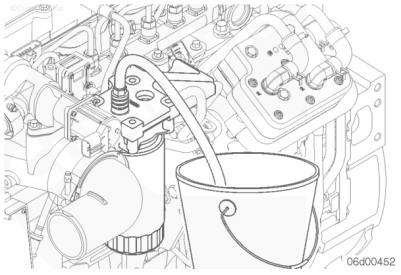
General Information

Perform the steps in the Priming procedure before beginning this procedure to make sure all entrapped air is removed from the system. Refer to Procedure 005-234 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-234-tr.html)

Setup

Note : A symptom of air in fuel for the engines equipped with a common rail fuel system is an audible surge associated with fuel system pressure fluctuations, due to air in the fuel supply.



The following test method will simulate rated fuel flow through the system, so air in fuel problems can be diagnosed.

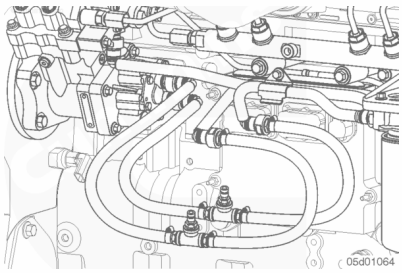
Install Compuchek™ fitting, Part Number 3824842, at the inlet to the 5 micron fuel filter and attach the 1.09 mm [0.043 in] diagnostic fuel line.

Route the outlet of the 1.09 mm [0.043 in] diagnostic fuel line into a collection device of suitable size (a 19 liter [5 gal] bucket is recommended).

Note : If there is **not** enough clearance to install female Compuchek™ fitting, Part Number 3824842,

an adapter fitting, Part Number 3932302, and 1/8 NPT male Compuchek™ fitting, Part Number 3377244, can be used to aid accessibility.

Obtain two diagnostic fuel lines, Part Number 4918895.



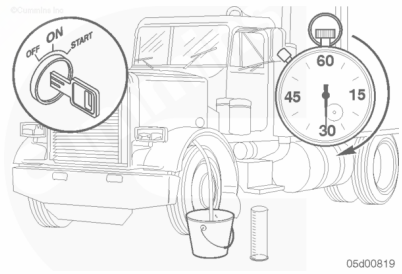
Install one diagnostic fuel line between the gear pump fuel supply line and the gear pump inlet (upper fuel line fitting).

Install the second diagnostic fuel line between the gear pump outlet and the pressure side fuel filter fuel supply line (lower fuel line fitting).

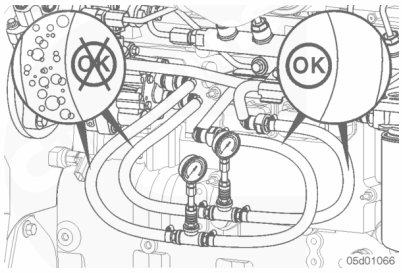
Note : If the engine is **not** equipped with an engine mounted pressure side fuel filter, diagnostic fuel line, Part Number 4918895, can **not** be installed at the gear pump outlet.

Measure

Start the engine. Operate the engine speed from idle to high idle several times to purge the air introduced while installing the diagnostic fuel line.



Observe the clarity of the fuel in the clear diagnostic fuel lines installed at the gear pump inlet and outlet. Air should **not** be present in the fuel.



Note : Make sure 0.043 inch orificed diagnostic fuel line, Part Number 3164621, is installed at the inlet of the fuel filter head. Make certain the test lines are **not** kinked or leaking after installation.

Bubbles at the inlet to the gear pump are an indication of a leak that allows air to enter, a severe inlet restriction that causes cavitation, or a system **not** yet primed. Refer to Procedure 006-020 Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-020.html)

- Suction fuel lines
- Engine control module (ECM) mounting plate assembly
- Original equipment manufacturer (OEM) fuel lines
- Suction-side fuel filter assemblies

ANADOLU ISUZU PARTS SALES

- Standpipe(s) in the fuel tank(s).

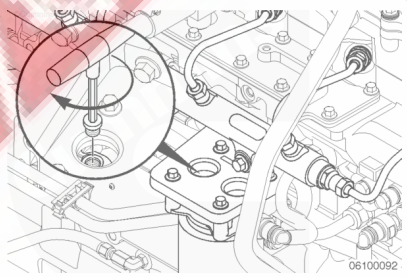
Note : Inspect clear diagnostic fuel lines to make sure air is **not** entering the diagnostic fuel line at the Compuchek™ fitting.

Clear fuel at the inlet of the gear pump and bubbles at the outlet of the gear pump are an indication the fuel pump gear pump is allowing air to enter the fuel system and the gear pump **must** be replaced. Refer to Procedure 005-025 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-025.html)

Test

⚠ WARNING ⚠

To reduce the possibility of fire and resulting severe personal injury, death or property damage, care must be taken when installing diagnostic equipment on the fuel system. Always allow a short period of time after shutting down the engine before loosening any fittings in the fuel system to allow residual fuel pressure to decrease.

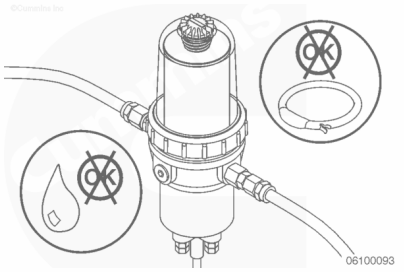


If the engine is hard to start or will **not** start, perform the following test to check for trapped air.

Check For Trapped Air:

- Crank the engine for 5 seconds.
- Turn the keyswitch OFF.
- Loosen the diagnostic port plug at the top of the fuel filter head while shielding the area with a shop towel.
- Trapped air will retain pressure in the system causing a spray of air/fuel mixture from the diagnostic port fitting.

If air is found to be trapped in the system, inspect the OEM-supplied suction-side fuel filter for leaks, loose fittings, damaged o-rings, etc.



ANADOLU ISUZU AFTER SALES

Finishing Steps

- Remove all test fuel lines. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Electrical contact cleaner, Part Number 3824510, or equivalent.

Additional Service Items

- Steam cleaner.

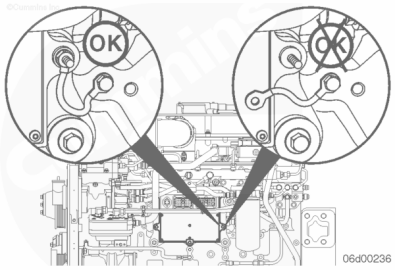
Initial Check

The engine control module (ECM) cooling plate assembly provides a vibration isolated mounting location for the ECM. The cooling plate also provides ECM cooling and incorporates the fuel lift pump. A check valve at the outlet port in the ECM cooling plate makes sure that the fuel system is primed while the fuel lift pump is running. Check the ECM cooling plate for damaged vibration isolators, loose capscrews, or fuel leaks.

Make sure that the ground strap is properly installed. A missing or poorly connected ground strap may cause intermittent engine performance problems.

The ground strap **must** be connected between the head of the ECM mounting bolt and the ECM.

The ground strap **must** be connected to an unpainted block surface that is free of corrosion.



Preparatory Steps

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure that debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the

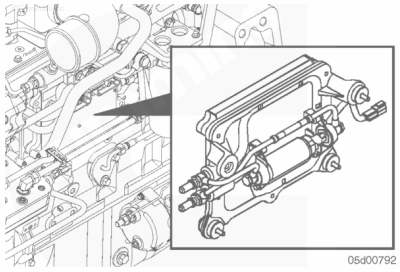
possibility of severe personal injury or death when working on the fuel system.

- Disconnect the batteries. See equipment manufacturer service information.
- Shut off the fuel supply and drain valves. See equipment manufacturer service information.
- Disconnect the rail fuel pressure sensor from the engine wiring harness. Refer to Procedure 019-115 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-115.html)
- Remove the high-pressure fuel lines from the fuel rail. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Remove the fuel drain line from the fuel pressure relief valve. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)

Remove

Note : The electric fuel priming pump and priming pump fuel lines will be attached to the ECM cooling plate while the cooling plate is being removed.

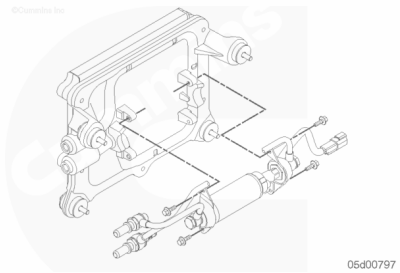
Remove the ECM cooling plate capscrews and ECM cooling plate from the engine block.



Disassemble

Remove the following components from the ECM cooling plate:

- Male banjo quick disconnect fitting
- Male banjo check valve fitting
- Fuel lift pump supply lines
- Fuel lift pump brackets
- Fuel lift pump.



ANADOLU ISUZU AFTER SALES

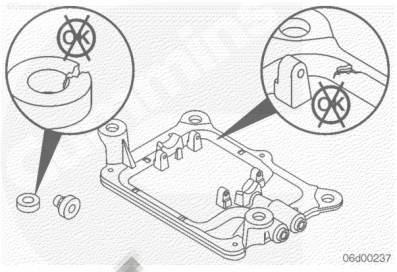
Inspect for Reuse

Inspect the ECM cooling plate for leaks (note that the fuel passages are contained in a tube that is cast into the cooling plate).

Replace any damaged vibration isolators.

Inspect for leaks in the electric fuel supply pump priming circuit. Look for cracked fuel tubes, damaged o-rings, or damaged seal washers.

Inspect the check valve for debris or damage.

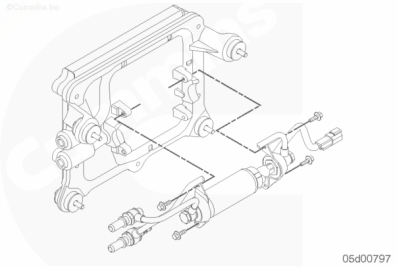


Assemble

Install the electric fuel priming pump and the priming circuit fuel lines. Refer to Procedure 005-045 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-045.html)

Make sure the lines are supported while tightening the banjo screws. The lines **must not** be permitted to bind.

Make sure the ECM check valve is installed into the bottom (outlet) fitting of the ECM cooling plate.

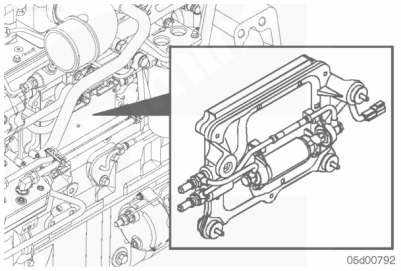


Install

Install the ECM cooling plate assembly on the engine block.

Tighten the capscrews.

Torque Value: 24 n•m [212 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Failure to properly install the ECM ground strap may cause intermittent engine symptoms including intermittent engine stalls. One end of the ground strap must be installed between the ECM housing and the head of the bottom most ECM mounting capscrew. The other end of the ground strap must be tightly bolted to an unpainted block surface that is free from corrosion.

Note : Make sure the vibrations isolators are installed correctly. The isolators fit in a single direction into the chamfered locators.

- Install the ECM on the ECM cooling plate. Refer to Procedure 019-031 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-031.html)
- Install the suction fuel lines, if removed.
- Connect the fuel supply lines. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Connect the engine harness to the electric fuel priming pump.
- Connect the ECM ground strap.
- Connect the harness connections to the ECM.
- Connect the batteries. See equipment manufacturer service information.
- Open the fuel supply valves, if equipped.
- Cycle the keyswitch and allow lift pump to operate for 30 seconds. Afterward, turn the keyswitch OFF and back ON again allowing the lift pump to operate again.
- Allow the lift pump to operate for three or four 30-second cycles before attempting to start the engine.
- Operate the engine. Check for leaks.

Last Modified: 19-Feb-2019

Select Service Tools

Recommended Cummins® Service Tools

- M12 banjo pressure gauge tool, Part Number 4918413
- Compuchek™ fitting, Part Number 3377244

Additional Service Items

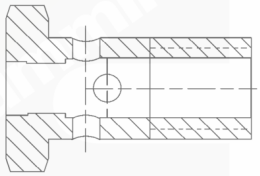
- No additional service items required.

Preparatory Steps

Obtain an M12 banjo pressure gauge tool, Part Number 4918413.

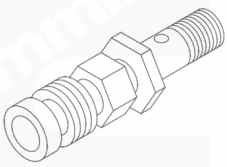
A banjo-style pressure gauge adapter can be used to measure pressure or vacuum at any point in the low-pressure fuel system where a banjo bolt exists at a fuel line.

The engine use M12 x 1.5 banjo bolt connections. Part Number 4918413 can be used for measurement of drain line restriction (pressure) at the fuel drain manifold.



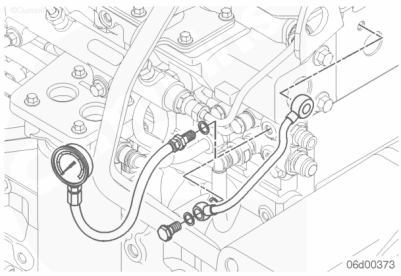
Assemble the banjo pressure gauge adapter.

1. Install Compuchek™ fitting, Part Number 3377244, or other type fitting in the hex face of the banjo bolt.
2. Attach a hose or pressure gauge to the banjo pressure adapter.



Install the M12 banjo pressure gauge adapter in place of the injector drain line banjo at the fuel drain manifold.

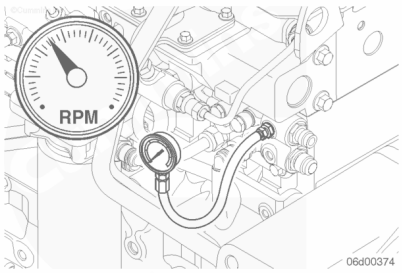
Install a 0 to 762 mm-hg [0 to 30 in-hg] pressure gauge at the M12 banjo pressure gauge adapter.



Measure

Operate the engine at rated speed and no load.

Observe the reading on the gauge.



Fuel Drain Line Pressure		
mm-hg		in-hg
254.0	MAX	10.0

If the drain line pressure is out of specification, check for bends or kinks in the drain lines. Look for places where the original equipment manufacturer (OEM) fuel lines can be pinched by wire ties or P-clips. Check for blocked fuel tank vents.

Finishing Steps

- Remove all test fittings. Install the drain lines.
- Operate the engine. Check for leaks. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)

Last Modified: 27-Jul-2016

ANADOLU ISUZU PARTS

Select Service Tools

Recommended Cummins® Service Tools

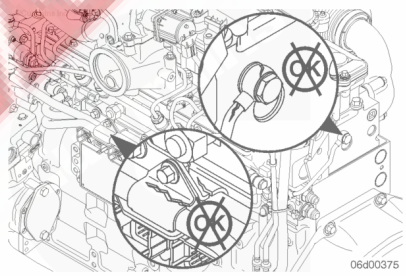
- Contact cleaner, Part Number 3824510, or equivalent

Additional Service Items

- No additional service items required.

Initial Check

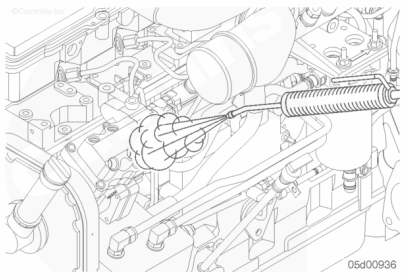
Inspect the drain lines for any signs of leaks, cracks, chafing, or loose or broken brackets.



Preparatory Steps

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

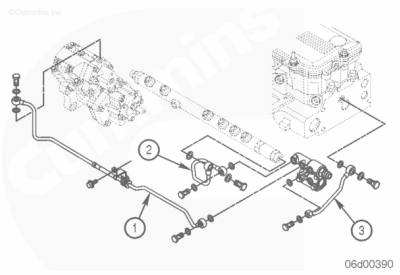
Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.
- Disconnect the batteries. See equipment manufacturer service information.

Remove

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.



⚠ WARNING ⚠

Do not vent the fuel system on a hot engine; this can cause fuel to spill onto a hot exhaust manifold, which can cause a fire.

There are three drain lines on the engine:

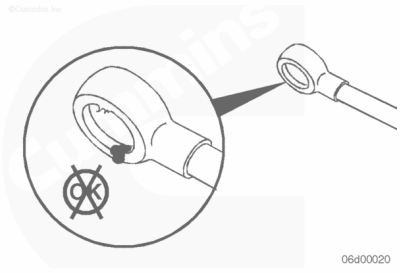
1. The fuel pump drain line connects the fuel pump to the fuel drain manifold.
2. The fuel rail pressure relief valve drain line connects the fuel rail pressure relief valve to the fuel drain manifold.
3. The injector drain line connects the back of the cylinder head to the fuel drain manifold.

These lines are removed by removing the banjo bolts and sealing washers.

Inspect for Reuse

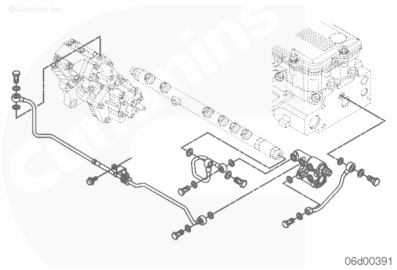
Inspect the lines for damage.

Inspect the banjo seal washers for damage.



Install

Install the three drain lines on the engine.



High-pressure fuel pump drain:

- Install the P-clip bracket.
- Install the banjo bolt at the fuel drain manifold.
- Install the banjo bolt at the fuel pump.

Pressure relief valve drain line:

- Install the banjo bolt at the fuel drain manifold.
- Install the banjo bolt at the pressure relief valve. Hold the line so it will **not** twist and wear against the bottom of the cylinder head.

Injector drain line.

Torque Value:
M12 Banjo Bolts 24 n•m [212 in-lb]

Torque Value:
M16 Banjo Bolts 43 n•m [32 ft-lb]

Torque Value:
P-Clip Capscrew 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

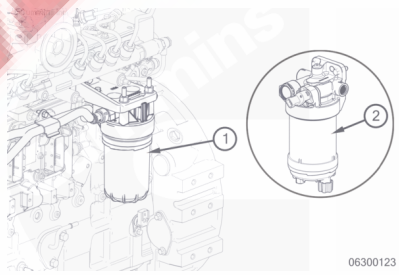
Recommended Cummins® Service Tools

- No Cummins® service tools required.

Additional Service Items

- Steam cleaner
- O-ring pick

General Information



The pressure-side fuel filter (1) is used for filtration **only** and is pressurized by the gear pump mounted on the engine's fuel pump.

Note : Some application utilize a chassis-mounted pressure-side filter.

The suction-side fuel filter (2) is a fuel-water separator and is located between the gear pump, mounted on the engine's fuel pump, and the original equipment manufacturer (OEM) fuel supply tank. This filter is not pressurized, but operates under a vacuum. Use the following procedure for maximum inlet restriction at the inlet and to test the suction-side fuel filter condition. Refer to Procedure 006-020 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-020.html)

Note : Some applications utilize an engine-mounted suction-side filter.

Note : This procedure applies to both suction- and pressure-side fuel filters (if supplied by Cummins Inc.). The vehicle/equipment OEM can be equipped with a non-Cummins Inc. supplied filter. See equipment manufacturer service information for further instruction.

Preparatory Steps

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

⚠ WARNING ⚠

Do not vent the fuel system on a hot engine; this can cause fuel to spill onto a hot exhaust manifold, which can cause a fire.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative(-) battery cable last.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

- Disconnect the batteries. See equipment manufacturer service information.
- Clean the area around the fuel filter. Use steam. Dry with compressed air.
- If required, disconnect the wiring harness from the water in fuel sensor.

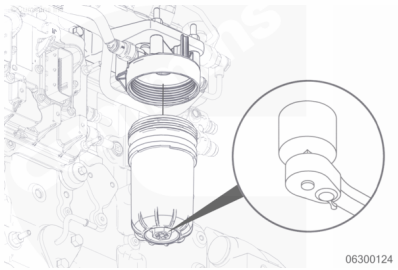
Remove

Loosen and remove the fuel filter.

Make sure the o-ring does **not** stick to the fuel filter head.
Remove the o-ring with an o-ring pick, if necessary.

ANADOLU ISUZU AFTER SALES

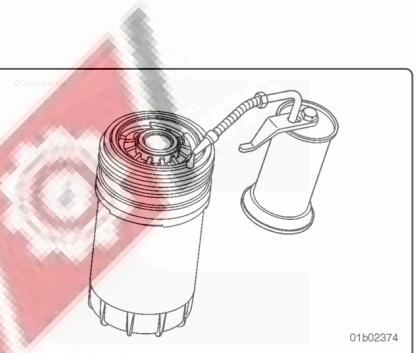
Remove the filter carefully. Remove the canister. Use the hex drive feature on the bottom of the filter.



Install

⚠ CAUTION ⚠

Do not pre-fill the pressure-side fuel filter with fuel unless a clean side block-off plug is used. The system must be primed after the fuel filter is installed. Pre-filling the pressure-side fuel filter can result in debris entering the fuel system and damaging fuel system components.



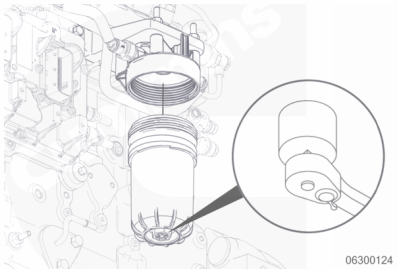
Note : If available, pre-fill new filters, both pressure-side and suction-side, with clean fuel prior to assembly. Use the clean side block-off plug packed with the filter. Do not pour fuel directly into the center of the filter. This will allow unfiltered fuel to enter the system and cause damage to fuel system components.

Use the correct fuel filter. Refer to Procedure 018-024 in Section V. (/qs3/pubsys2/xml/en/procedures/459/459-018-024.html)

Lubricate the fuel filter o-ring. Use clean lubricating oil.

⚠ CAUTION ⚠

Mechanical overtightening can distort the threads as well as damage the filter element seal or filter can.



Install the filter on the filter head:

- Install to the point of first contact for the filter and head.
- Tighten the canister. Use the hex drive feature on the bottom.

Torque Value: 38 n•m [28 ft-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- If required, connect the wiring harness to the water in fuel sensor.
- Connect the batteries. See equipment manufacturer service information.
- Prime the fuel system. Refer to Procedure 005-234 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-234-tr.html)

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

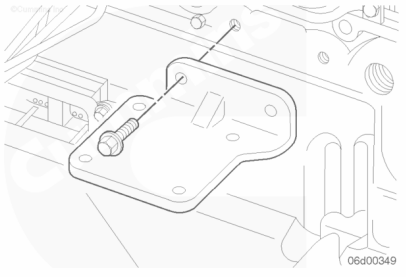
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which can expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the fuel filter. Refer to Procedure 006-015 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-015-tr.html)
- Remove the fuel supply lines from the filter head. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Remove the fuel filter head. Refer to Procedure 006-017 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-017.html)

Remove

Remove the filter head bracket from the engine.

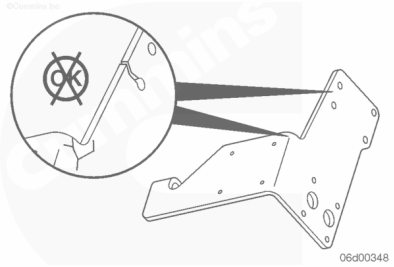


Inspect for Reuse

ANADOLU ISUZU AFTER SALES

Inspect the filter head for bracket mounting for cracks and signs of fretting on the mounting holes.

Replace the bracket if it is cracked or has signs of fretting.

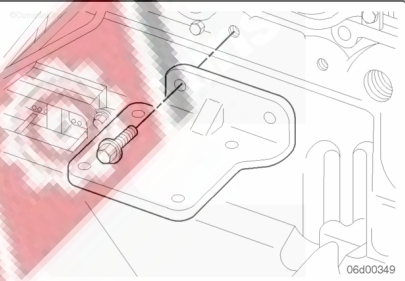


Install

Install the fuel filter head bracket and filter head.

Tighten the retaining capscrews.

Torque Value: 43 n•m [32 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fuel filter head. Refer to Procedure 006-017 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-017.html)
- Install the fuel filter. Refer to Procedure 006-015 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-015-tr.html)
- Install the fuel supply lines. Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Diagnostic fuel line, Part Number 3164621
- Pressure gauge adapter, Part Number 4918324
- Fuel line connector fitting, Part Number 3972088
- M10 Compuchek™ fitting, Part Number 3824842
- Adapter fitting, Part Number 3932302
- 1/8 NPT male Compuchek™ fitting, Part Number 3377244
- Diagnostic fuel line, Part Number 4918895
- Slide removal tool, Part Number 4918878

Additional Service Items

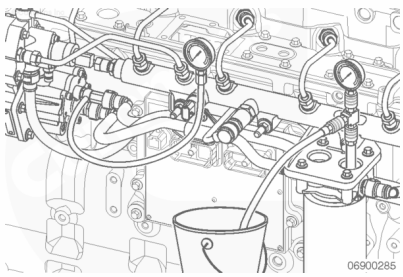
- Container suitable for fuel
- Vacuum gauge

Preparatory Steps

Obtain a 1.09 mm [0.043 in] orificed diagnostic fuel line, Part Number 3164621.

Obtain a container suitable for collection of fuel that exits the diagnostic fuel line. A 19 liter [5 gal] bucket is recommended.

Install pressure gauge adapter, Part Number 4918324. Use fuel line connector fitting, Part Number 3972088, at the inlet to the gear pump.



Note : The quick-disconnect fitting threaded into the inlet of the fuel pump **must** be substituted for fuel line connector fitting, Part Number 3972088, in order to use pressure gauge adapter, Part Number 4918324.

Install M10 Compuchek™ fitting, Part Number 3824842, at the fuel filter head.

Note : If there is **not** enough clearance to install female Compuchek™ fitting, Part Number 3824842, adapter fitting, Part Number 3932302, and 1/8 NPT

male Compuchek™ fitting, Part Number 3377244, can be used to aid accessibility.

Attach the 1.09 mm [0.043 in] orificed diagnostic fuel line at the fuel filter head Compuchek™ fitting. Route this hose into a collection container or into the vehicle fuel tank.

Note : It is necessary to attach the 1.09 mm [0.043 in] orificed diagnostic fuel line so the fuel pump can reach rated flow. Failure to reach rated flow may result in an incorrect test result.

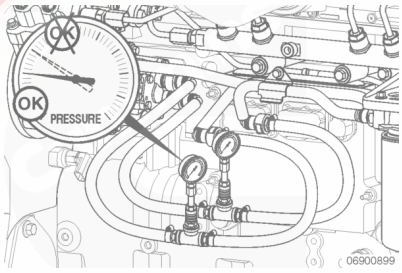
Attach a 0 to 762 mm-hg [0 to 30 in-hg] vacuum gauge to pressure gauge adapter, Part Number 4918324, at the gear pump inlet.

Install M10 Compuchek™ fitting, Part Number 3824842, at the original equipment manufacturer (OEM) fuel inlet connection.

Attach a 0 to 762 mm-hg [0 to 30 in-hg] vacuum gauge at the OEM fuel inlet connection.

⚠ CAUTION ⚠

Make sure the slide removal tool is removed from the fuel line as soon as possible after the line has been disconnected. Inadvertently leaving the tool in place can result in fuel leaks.



Alternative Set-up

Install diagnostic fuel line, Part Number 4918895, between the gear pump fuel supply line and gear pump inlet (upper fuel line fitting).

To aid in the removal of quick-disconnect style fuel lines, slide removal tool, Part Number 4918878, over the locking tangs.

Attach a 0 to 762 mm-hg [0 to 30 in-hg] vacuum gauge to pressure gauge adapter, Part Number 4918895, connected at the gear pump inlet.

Install M10 Compuchek™ fitting, Part Number 3824842, at the fuel filter head.

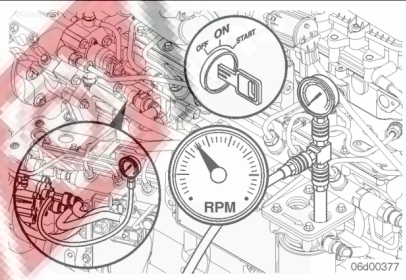
Note : If there is **not** enough clearance to install female Compuchek™ fitting, Part Number 3824842, adapter fitting, Part Number 3932302, and 1/8 NPT male Compuchek™ fitting, Part Number 3377244, can be used to aid accessibility.

Attach the 1.09 mm [0.043 in] orificed diagnostic fuel line at the fuel filter head Compuchek™ fitting. Route this hose into a collection container or into the vehicle fuel tank.

Note : It is necessary to attach the 1.09 mm [0.043 in] orificed diagnostic fuel line so the fuel pump can reach rated flow. Failure to reach rated flow can result in an incorrect test result.

Measure

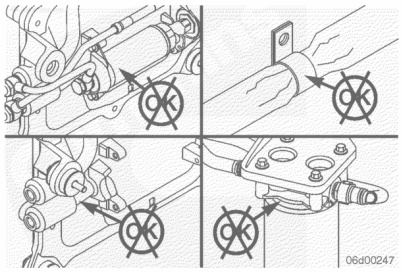
Operate the engine at high idle. Measure the inlet vacuum.



Allow the engine to operate for at least 30 seconds before measuring. Measurements **must** be taken after the fuel lift pump has turned OFF.

Maximum Fuel Inlet Restriction		
mm-hg		**in-hg**
203.2	At OEM connection (dirty filter) loaded condition	8.0
254	At inlet to fuel gear pump (dirty filter) loaded condition	10.0

If the inlet restriction is excessive, look for the root cause:



- Suction-side fuel filters plugged
- Fuel heater valves restricted
- Engine control module (ECM) mounting plate plugged
- ECM cooling plate check valve restricted
- OEM fuel lines pinched or restricted
- Fuel tank stand pipes restricted.

Finishing Steps

- Disconnect all diagnostic test fittings. Install all components removed during testing.

BARDOLU ISUZU PARTS SALES

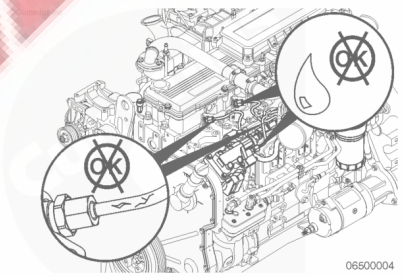
Initial Check

Inspect all fuel supply lines and fittings. Look for cracks in the lines or leaking fittings.

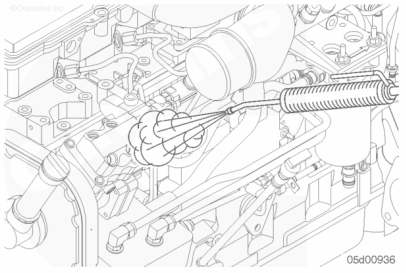
Inspect the quick-disconnect style fittings for damaged o-ring connections or broken locking tangs.



Preparatory Steps

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

ANADOLU ISUZU AFTERSALES

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

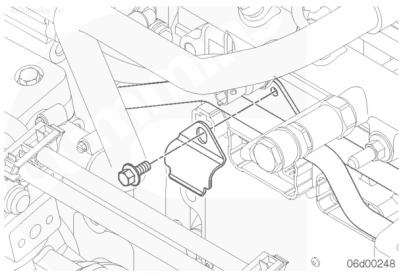
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

- Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.
- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.
- Disconnect the batteries. See equipment manufacturer service information.
- Close the fuel supply and return valves. See equipment manufacturer service information.

Remove

⚠ WARNING ⚠

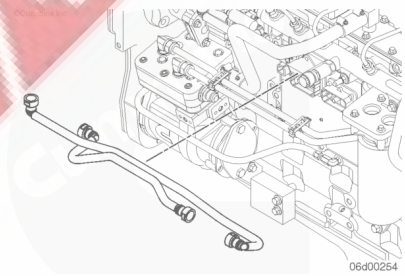
Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.



For quick-disconnect style fuel lines, remove the clasp from the fuel line brace. This will allow the lines to move so they can be disconnected.

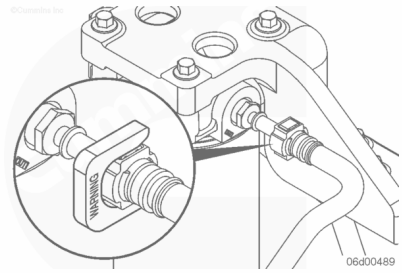
Loosen all quick-disconnect lines from the brace.

To remove the gear pump outlet line, the gear pump inlet line **must** be removed first.

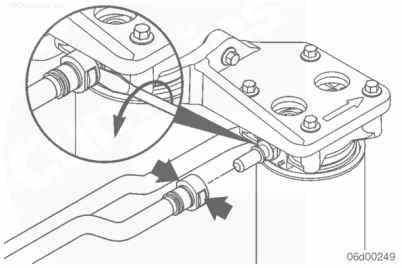


Remove the quick-disconnect style fuel lines by pressing in the locking tangs on both sides of the quick-disconnect fitting.

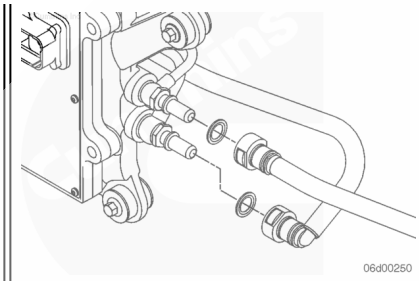
To aid in the removal of quick-disconnect style fuel lines, slide removal tool, Part Number 4918878, over the locking tangs. Make sure the tool is removed from the fuel line as soon as possible after the line has been disconnected. Inadvertently leaving the tool in place can result in fuel leaks.



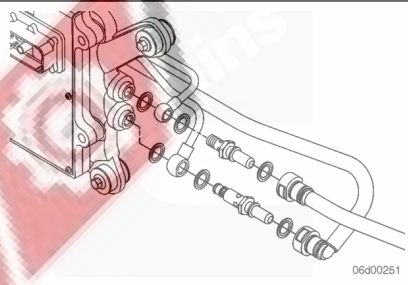
To aid removal, a screwdriver can be inserted between the fuel line end and quick-disconnect male union. After pressing the opposing locking tangs, twisting the flat blade of the screwdriver helps to remove the fuel line.



If fuel leaks or suction-side air entry is suspected, remove the fuel hoses or quick-disconnect fittings.



Inspect for Reuse



Inspect for burrs or debris on metal connectors that can cause leaks.

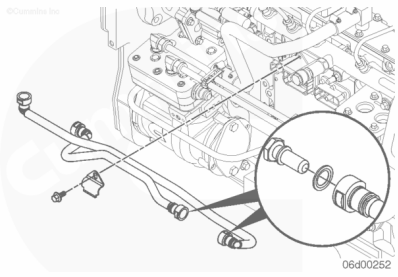
On straight thread o-ring metric connectors, be certain the o-rings are **not** frayed or cut.

On quick-disconnect style fittings, be certain the o-rings are **not** frayed or cut, and the lock tangs are **not** damaged.

The lower quick-disconnect fitting on the mounting plate has a check valve built in to it.

- Inspect the anti-drain back valve for damage or improper sealing. Replace, if necessary.
- Verify the anti-drain back valve seats properly and is free of damage or debris. If damage is found, replace the valve.

Install



Install the quick-disconnect fuel lines.

Install the quick-disconnect fittings.

Torque Value: 24 n•m [212 in-lb]

Make sure the quick-disconnect style fuel lines clasp onto the quick-disconnect fittings.

Make sure the lines are routed and connected correctly. If the lines are connected incorrectly, the engine will **not** operate.

Fuel lines are routed in the following order:

1. Original equipment manufacturer (OEM) connection to the upper fitting at the engine control module (ECM) mounting plate.
2. Lower ECM mounting plate fitting to the upper gear pump fitting.
3. Lower gear pump fitting to the pressure side fuel filter inlet.
4. Pressure-side fuel filter outlet to the fuel pump fuel control actuator housing.

The fuel supply line brace holds the fuel lines in the following order:

1. The inside line connects the upper gear pump fitting to the lower ECM mounting plate fitting.
2. The middle line connects the pressure side fuel filter outlet to the fuel pump fuel control actuator housing.
3. The outside line connects the lower gear pump fitting to the pressure side fuel filter inlet.

Install the fuel line brace clasp (quick-disconnect style fuel lines **only**) and the brace, if necessary.

Torque Value:
Fuel Line Brace 24 n•m [212 in-lb]

Torque Value:
Fuel Line Brace Clasp 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Open the fuel supply and return valves, if equipped. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Prime the fuel system. Refer to Procedure 005-234 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-234-tr.html)
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Last Modified: 03-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- Contact cleaner, Part Number 3824510, or equivalent

Additional Service Items

- Heel-bar
- Torque wrench

Preparatory Steps

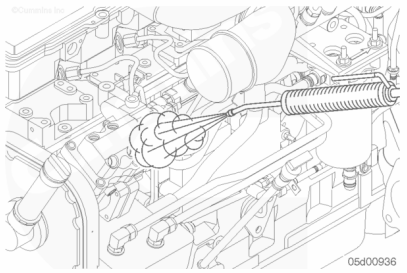
⚠ CAUTION ⚠

Attempting to remove the injector without first removing the fuel connector will cause damage to the injector body and/or fuel connector.

Note : All fuel system diagnostics procedures and component specifications have been moved. Refer to Procedure 005-236 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-236.html)

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

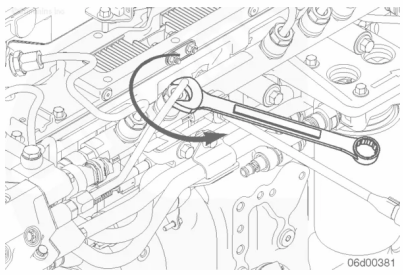
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump-to-rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.



⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

⚠ CAUTION ⚠

Attempting to remove the injector without first removing the fuel connector will cause damage to the injector body and/or fuel connector.

- Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure.
- Keep hands clear of the line when loosening.
- Tighten the pump-to-rail line nut.

Torque Value: 65 n•m [48 ft-lb]

Note : A machined slot in this fitting directs the fuel spray toward the cylinder block.

- Disconnect the batteries. See equipment manufacturer service information.
- Close the fuel supply and drain valves. See equipment manufacturer service information.
- Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- Remove the high-pressure fuel lines from the fuel rail. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Remove the engine brake, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Remove the fuel connector. Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)
- Remove the exhaust rocker lever assembly. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)

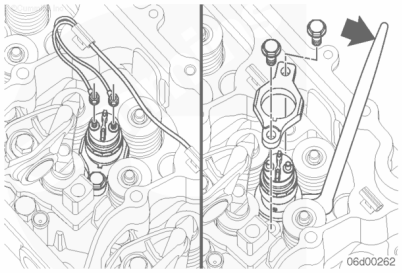
ANADOLU ISUZU GENUINE SALES

Remove

Disconnect the injector wire harness from the injector.

Remove the two injector hold-down clamp capscrews. Remove the injector hold-down clamp.

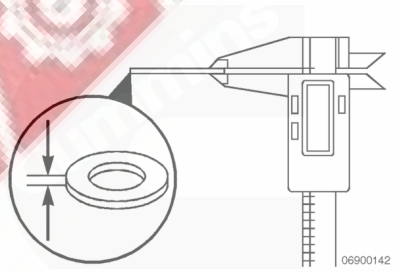
Use a small heel-bar to pry up on the injector clamp hold-down flange (part of the injector body just above the cylinder head casting).



Clean and Inspect for Reuse

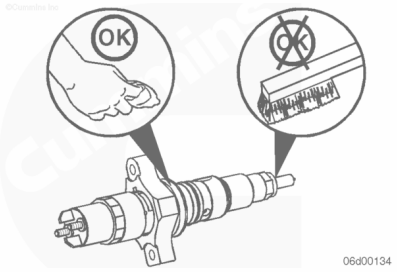
Install a new combustion sealing washer on the injector.

Verify the new injector sealing washer is the correct thickness. An incorrect sealing washer can cause high pressure fuel leaks and/or performance problems, due to incorrect injector protrusion.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to avoid personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

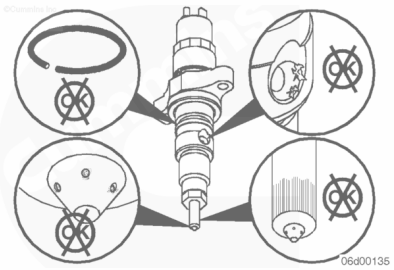
⚠ CAUTION ⚠

Do not use any abrasives (such as glass beading, sand paper, emery cloth, Scotch-Brite™ pads, etc) or metallic items (including wire brushes made of any metallic material) to clean the injectors. The use of any cleaning method other than safety solvent and a soft, clean, lint-free cloth will damage the nozzle holes and cause performance issues.

ANADOLU ISUZU PARTS

Clean the injector tip and body. Use safety solvent and a soft, clean cloth.

Inspect the injector and high-pressure connector o-rings for damage. Replace, if necessary. Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)



Inspect the injector inlet, high-pressure connector tip, and high-pressure connector inlet for damage.

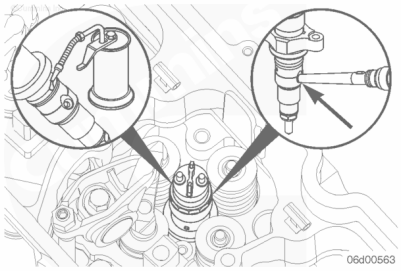
Check the nozzle holes for any signs of damage, such as hole erosion or hole plugging.

Spray safety solvent on the injector body. Inspect the fuel inlet passage for small cracks that can allow high-pressure fuel to leak to the injector drain passage.

Inspect the solenoid terminals for damage.

Install

Note : If a new injector is being installed, a new fuel connector **must** be used.



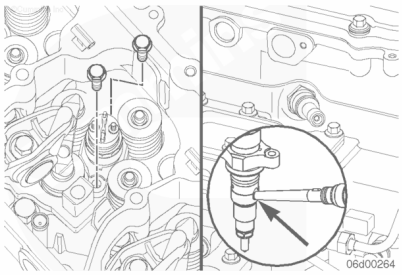
Make sure the injector bore is clean and **only** one (1) sealing washer is installed on the injector nozzle.

Lubricate the injector o-ring. Use clean engine oil.

Place the injector in the cylinder head in the proper orientation (fuel inlet toward the high-pressure fuel connector).

Press down firmly on the injector to make sure it is seated in the injector bore.

Note : Start the injector hold-down clamp capscrews, but do **not** tighten.



Start the injector hold-down clamp capscrews. Tighten hand-tight.

Install the high-pressure fuel connector, making sure the end of the high-pressure fuel connector is in the injector inlet port.

ANADOLU ISUZU OTOSAN

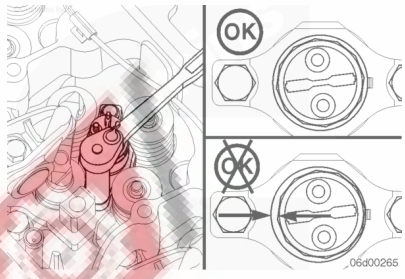
Note : The high-pressure fuel connector should click into place if it is seated in the injector inlet port correctly.

Start the high-pressure fuel connector retaining nut. Tighten partially.

Torque Value: 15 n•m [133 in-lb]

Note : This is **not** the final torque for the high-pressure fuel connector retaining nut.

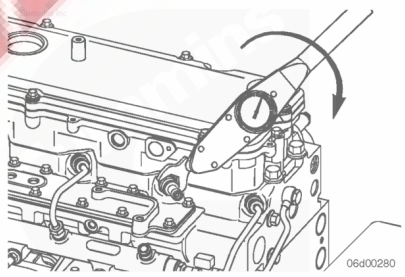
Tighten the injector hold-down clamp capscrews.



Note : Make sure to tighten the hold-down clamp capscrews evenly. Check to make sure the gap between the hold-down clamp and injector is equally spaced around the injector body.

Torque Value: 10 n•m [89 in-lb]

Tighten the high pressure fuel connector retaining nut.

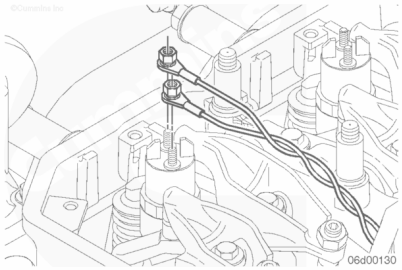


Use the following procedure for the final torque value. Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)

Note : The high-pressure fuel connector **must** be properly tightened or an internal fuel leak can result, causing poor engine performance. A torque wrench **must** be used.

⚠ CAUTION ⚠

Do not overtighten the injector harness. The injector terminals will be damaged if excessively over-tightened.



Install the injector wiring harness to the injector.

Torque Value: 2 n•m [18 in-lb]

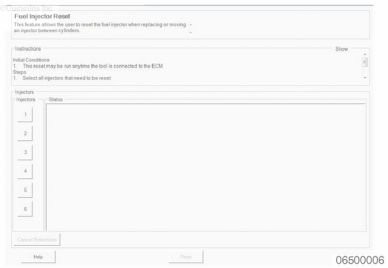
Note : Polarity of the wiring is **not** significant. The signal and return wires can be connected to either injector terminal.

Note : Orient the injector wires so they will **not** interfere with a rocker lever or engine brake housing. If the rocker lever is able to come into contact with the injector harness, it will rub through the wire insulation and cause injector circuit fault codes.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.



06500006

- Orient the injector wires so they will **not** interfere with a rocker lever or engine brake housing. If the rocker lever is able to come into contact with the injector harness, it will rub through the wire insulation and cause injector circuit fault codes.
- Install the exhaust rocker lever assembly. Refer to Procedure 003-008 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-008.html)
- Install the engine brake, if equipped. Refer to Procedure 020-004 in Section 20. (/qs3/pubsys2/xml/en/procedures/425/425-020-004-tr.html)
- Install the high pressure fuel lines. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)
- If a malfunction resulted in coolant, excessive fuel, or excessive black smoke entering the exhaust system, the aftertreatment system **must** be inspected. Refer to Procedure 014-015 (/qs3/pubsys2/xml/en/procedures/425/425-014-015.html), Refer to Procedure 014-016 (/qs3/pubsys2/xml/en/procedures/425/425-014-016.html), or Refer to Procedure 014-017 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-017.html)
- Open the fuel supply and return valves. See equipment manufacturer service information.

ANADOLU ISUZU AFTER SALES

- Connect the batteries. See equipment manufacturer service information.

Injector Reset Installation Instructions: INSITE™ 7.6 and Newer

1. Connect INSITE™ electronic service tool to the engine control module (ECM).
2. Select "Advanced ECM Data".
3. Select "Fuel Injector Reset".
4. Read the information listed under the "Fuel Injector Reset" and "Instructions" headings.
5. After INSITE™ electronic service tool completes the "Fuel Injector Reset" and the status box reads "All injector reset commands have been sent to ECM", clear all fault codes.
6. Operate the engine. Check for leaks.
7. Perform five throttle snaps.
8. Verify there are no injector related fault codes.

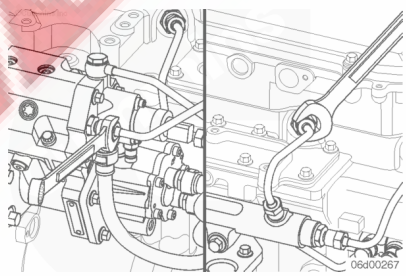
Initial Check

Note : The nuts **must** be properly tightened or an external fuel leak can result in poor engine performance. A torque wrench **must** be used.



Check the fuel pump connection.

Torque Value: 50 n•m [37 ft-lb]

Check the cylinder head connections.

Torque Value: 50 n•m [37 ft-lb]

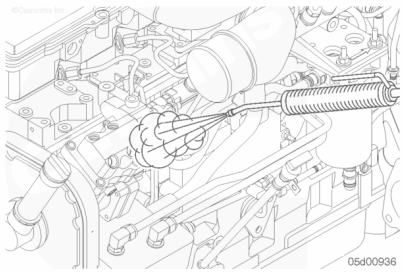
Check the fuel rail connections.

Torque Value: 65 n•m [48 ft-lb]

Preparatory Steps

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.



⚠ WARNING ⚠

ANADOLU ISUZU AFTER SALES

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

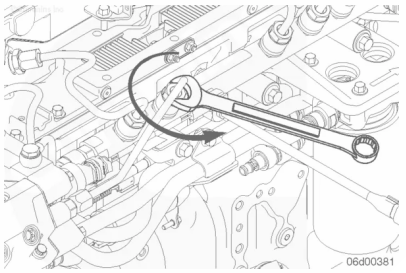
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use electrical contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump-to-rail fuel line at the rail to



vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure.

Keep hands clear of the line when loosening.

Tighten the fuel rail nut.

Torque Value: 65 n•m [48 ft-lb]

Note : A machined slot in this fitting directs the fuel spray toward the engine block.

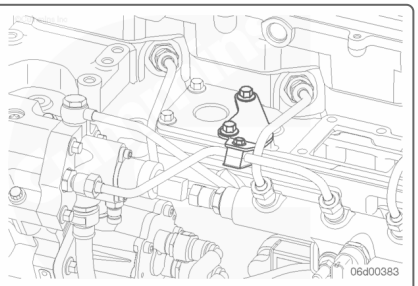
- Disconnect the batteries. See equipment manufacturer service information.

ANADOLU ISUZU SPARE PARTS SALES

Remove

⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of fire and resulting severe personal injury, death, or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.



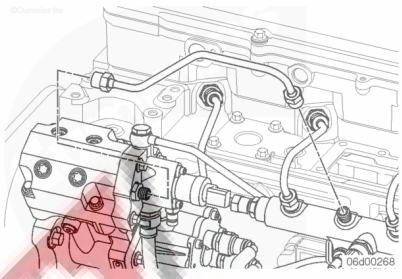
Loosen the fuel lines at the fuel rail, the fuel connector, and the high-pressure fuel pump outlet fitting.

Loosen the capscrews on the fuel line support bracket and isolator.

Remove the high-pressure fuel lines.

Loosen the fuel lines at the fuel rail, the fuel connector, and the high-pressure fuel pump outlet fitting.

Remove the high-pressure fuel lines.



Clean and Inspect for Reuse

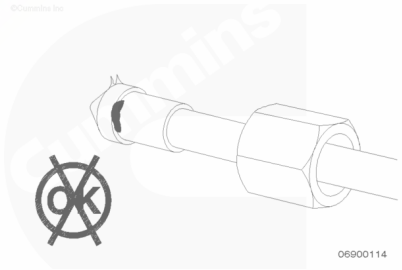
Inspect the high-pressure fuel supply line ferrules for signs of burrs, foreign material, rounding, or cracking.

Inspect the ends of the high-pressure lines for damaged sealing surfaces and signs of rust corrosion.

Check the high-pressure supply line body and ferrules for cracks, wear, or pinched areas.

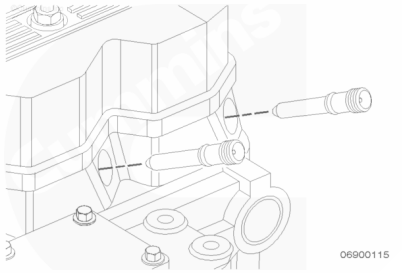
Inspect the high-pressure lines for binding between the line ferrules and mounting nuts.

If the high-pressure fuel line(s) do **not** meet the criteria listed above, the damaged fuel line(s) **must** be replaced.



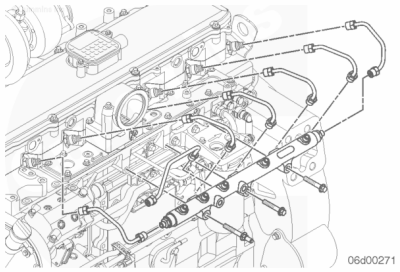
Install

Before installing the injector supply lines, make sure the fuel connector is fully and properly seated against the injector. Make sure the high-pressure connector retaining nut is tightened. Refer to Procedure 006-052 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-052.html)



⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of fire and resulting severe personal injury, death or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.



Follow the proper sequence to make sure the high-pressure fuel lines are properly aligned:

1. Loosen the fuel rail capscrews so that they are **only** finger-tight but maintain even contact between the rail mounting feet and the cylinder head.

2. Install the fuel line from the high-pressure pump to the fuel rail. Hand tighten.

3. Install the fuel lines from the fuel rail to the fuel connectors. Hand-tighten.

4. Install fuel line support bracket capscrews. Hand tighten.

5. Tighten the high-pressure fuel lines at the high-pressure fuel connectors and the pump to rail line at the pump connector.

Torque Value: 50 n•m [37 ft-lb]

6. Tighten the high-pressure fuel lines and the pump to rail line at the rail.

Torque Value: 65 n•m [48 ft-lb]

7. Tighten the fuel line support bracket capscrews.

Torque Value: 24 n•m [212 in-lb]

8. Tighten the fuel rail assembly capscrews.

Torque Value: 43 n•m [32 ft-lb]

ANADOLU ISUZU PARTS SALES

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- If removed, install the air intake connection. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure.

Keep hands clear of the line when loosening.

Tighten the fuel rail nut.

Torque Value: 65 n•m [48 ft-lb]

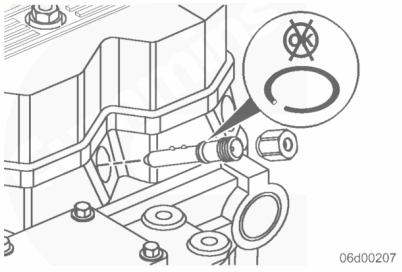
Note : A machined slot in this fitting directs the fuel spray toward the engine block.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the high-pressure fuel supply lines. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)

Remove

Remove the fuel connector retaining nut.

Use fuel connector puller, Part Number 3164025, to remove the fuel connector from the cylinder head.



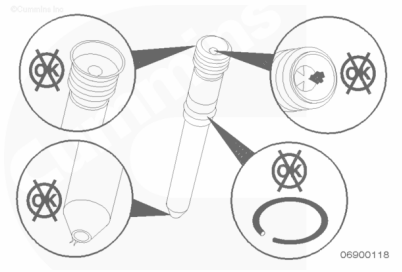
Inspect for Reuse

A new high-pressure connector **must** be installed if a new injector is being installed.

Inspect the fuel connector. Look for burrs or deformation around the inlet and outlet sides of the connector.

Check the edge filter for signs of plugging or material contamination. Do **not** reuse a high-pressure fuel connector if debris is present.

Check the o-ring for tearing or deterioration.

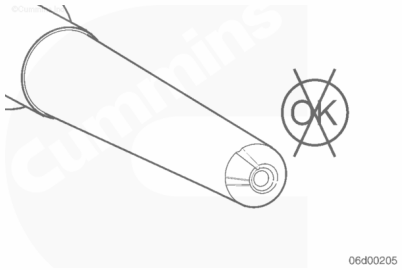


ANADOLU ISUZU AFTER SALES

Inspect the outlet sealing surface of the high-pressure connector for wear, an uneven seating surface, or signs of leakage.

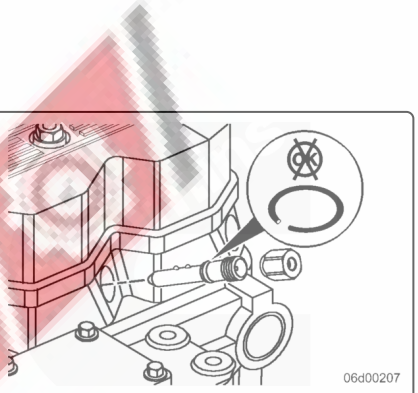
When a high-pressure fuel leak is present, small lines or cuts in the connector will be eroded into the seating surface.

The high-pressure connector and injector **must** be replaced when this condition is observed.



Install

Note : If the injector was removed along with the high-pressure fuel connector, the installation steps **must** be followed. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)



Tighten the fuel connector retaining nut.

Torque Value: 55 n•m [41 ft-lb]

The high-pressure fuel connector **must** be properly tightened or an internal fuel leak can result, causing poor engine performance. A torque wrench **must** be used.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

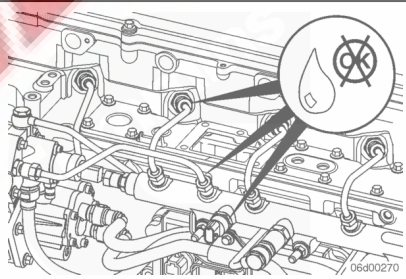
Initial Check

⚠ WARNING ⚠

The fuel pump, high-pressure fuel lines, and fuel rail contain very high-pressure fuel. Do not loosen any fittings while the engine is running. Wait at least 10 minutes after shutting down the engine before loosening any fittings in the high-pressure fuel system to allow pressure to decrease to a lower level.



⚠ WARNING ⚠

High pressure fuel spray can cause serious injury or death.

⚠ WARNING ⚠

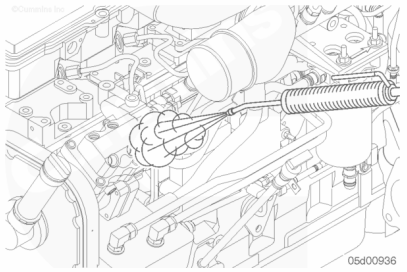
The fuel pump, high-pressure fuel lines, and fuel rail contain very high-pressure fuel. To reduce the possibility of personal injury, never loosen any fittings while the engine is running.

Inspect the fuel pressure sensor, high-pressure fuel line connections, and male unions for leaks.

Preparatory Steps

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ CAUTION ⚠

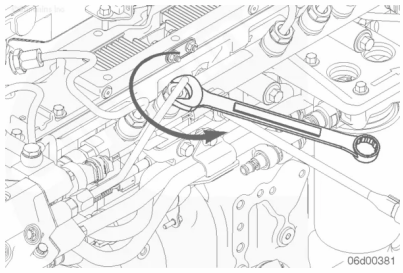
Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html) Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.



- Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure.
- Keep hands clear of the line when loosening.
- Tighten the pump-to-rail line nut.

Torque Value: 65 n•m [48 ft-lb]

Note : A machined slot in this fitting directs the fuel spray toward the cylinder block.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

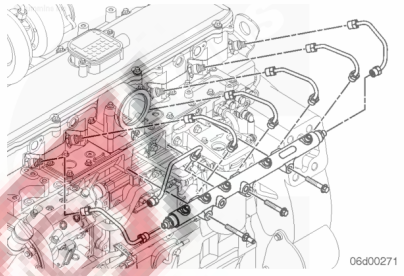
- Disconnect the batteries. See equipment manufacturer service information.
- Shut off the fuel supply and drain valves. See equipment manufacturer service information.
- Disconnect the rail fuel pressure sensor from the engine wiring harness. Refer to Procedure 019-115 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-115.html)
- Remove the high-pressure fuel lines from the fuel rail. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)

- Remove the fuel drain line from the fuel pressure relief valve. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)

Remove

Remove the capscrews that secure the fuel rail to the cylinder head.

Remove the fuel rail assembly.



Disassemble

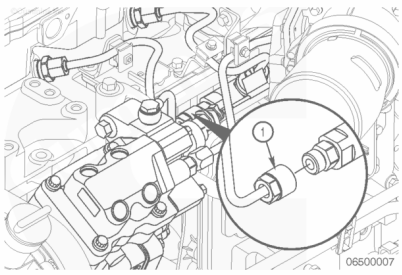
Remove the high-pressure fuel line fitting (1) from the end of the fuel rail.

Remove and discard the sealing washer.

A flat sealing washer is swaged into the inlet fitting bore during installation.

A special tool can be created to aid in its removal by grinding a 45 degree angle on the short leg of a 1/8 inch or 3/16 inch Allen wrench, so the wrench is no longer than 13 mm [1/2 in] long (measured from the outside of the long leg).

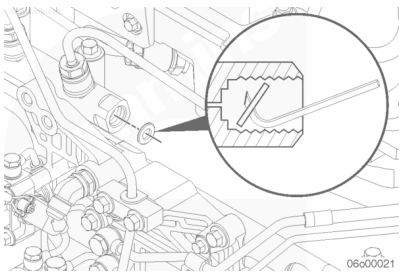
This tool acts as a mini heel bar to pry out the sealing washer without damaging the back of the hole.



The sealing washer **must** be replaced if the number 1 fuel line rail fitting is removed.

Use the modified Allen wrench to pry out the old sealing washer from the threaded hole in the fuel rail.

Note : Considerable force is required to remove the sealing washer.

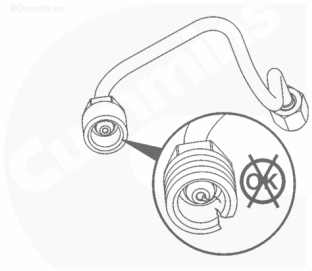


ANADOLU ISUZU ASTER SALES

Inspect for Reuse

If the number 1 fuel line rail fitting exhibits excessive leakage to drain, it **must not** be reused.

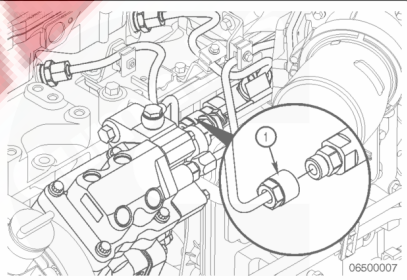
Inspect the high-pressure seal surface on the fuel line rail fitting and in the fuel rail for damage. Do **not** reuse components if the high-pressure seal joint is damaged.



Assemble

Install the fuel line rail fitting (1) and a new sealing washer. Use assembly lubricant, Part Number 3163087, or equivalent, on the threads.

Tighten the fuel line rail fitting (1) with the torque plus angle method.

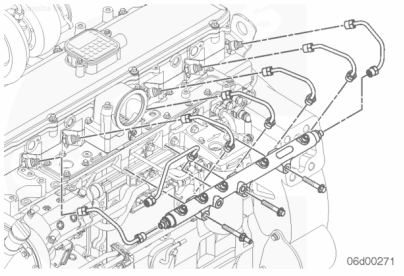


Torque Value:

1. 27 n•m [239 in-lb]
2. Rotate 90 degrees.

Install

Install the fuel rail assembly. Follow the proper sequence to make sure that high-pressure fuel lines are properly aligned. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)



Finishing Steps

High pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.

⚠ CAUTION ⚠

ANADOLU ISUZU PARTS SALES

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

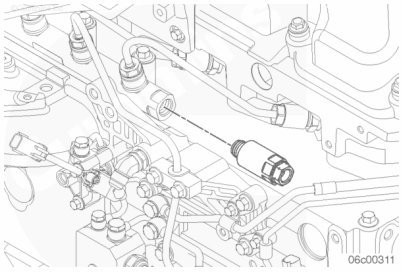
- Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine component to potential contaminants prior to disassembly, clean the fittings, mounting hardware, and the area around the component to be removed. Dirt or contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.
- Clean the engine. Refer to Procedure 000-009 in Section 0. (/qs3/pubsys2/xml/en/procedures/99/99-000-009.html)
- Use contact cleaner, Part Number 3824510, or equivalent, to thoroughly clean all fuel lines before removal from the engine. Clean the connector fittings to remove as much debris as possible. It is very important extra care is taken to keep the fuel connections clean during removal and installation. Refer to Procedure 204-008 in Section i. (/qs3/pubsys2/xml/en/procedures/99/99-204-008.html)
- Make sure debris, water, steam, or cleaning solution does **not** get inside the fuel system.
- Before servicing the fuel system, loosen the pump-to-rail line at the rail to vent the pressure.
- Keep hands clear of the line when loosening.
- Tighten the pump to rail line nut.

Torque Value: 65 n•m [48 ft-lb]

- Close the fuel supply and drain valves. See equipment manufacturer service information.
- Disconnect the batteries. See equipment manufacturer service information.
- Remove the fuel drain line from the fuel rail pressure relief valve. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Remove the fuel pressure relief valve reducer, if required.

Remove

Remove the fuel pressure relief valve.



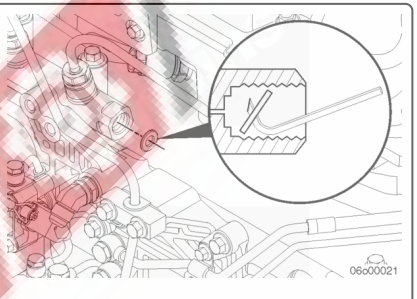
Remove and discard the sealing washer.

A flat sealing washer is swaged into the inlet fitting bore during installation.

A special tool can be created to aid in its removal by grinding a 45 degree angle on the short leg of a 1/8 inch or 3/16 inch Allen wrench, so the wrench is no longer than 13 mm [1/2 in] long (measured from the outside of the long leg.)

This tool acts as a mini heel bar to pry out the sealing washer without damaging the back of the hole.

Note : Considerable force is required to remove the sealing washer.



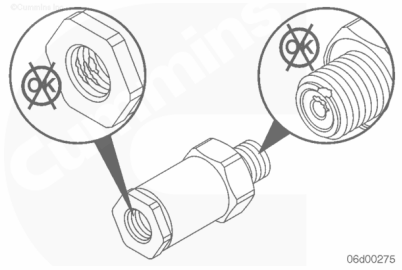
The high-pressure relief valve sealing washer **must** be replaced if the high-pressure relief valve is removed.

Pry out the old sealing washer from the threaded hole in the fuel rail. Use the modified Allen wrench.

ANADOLU ISUZU
AFTER SALES

Inspect for Reuse

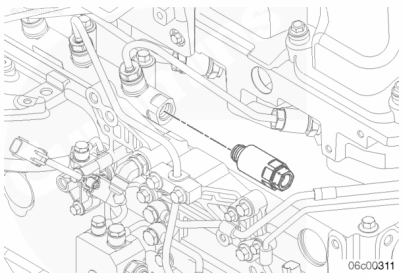
If the fuel pressure relief valve exhibits excessive leakage to drain, it **must not** be reused.



Inspect the high-pressure seal surface on the fuel pressure relief valve and in the fuel rail for damage. Do **not** reuse components if the high-pressure seal joint is damaged.

Install

Install the fuel pressure relief valve and a new sealing washer. Use assembly lubricant, Part Number 3163087, or equivalent, on the threads. Tighten the pressure relief valve. Use the torque plus angle method.



Torque Value:

1. 27 n•m [239 in-lb]

2. Rotate 90 degrees.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fuel drain line to the fuel pressure relief valve. Refer to Procedure 006-013 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-013.html)
- Open the fuel supply and drain valves. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Last Modified: 01-Nov-2016

Select Service Tools

Recommended Cummins® Service Tools

- Contact cleaner, Part Number 3824510, or equivalent

Additional Service Items

- Container suitable for fuel

Preparatory Steps

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

Wear safety glasses or a face shield, as well as protective clothing, to prevent personal injury when using a steam cleaner or high-pressure water.

⚠ WARNING ⚠

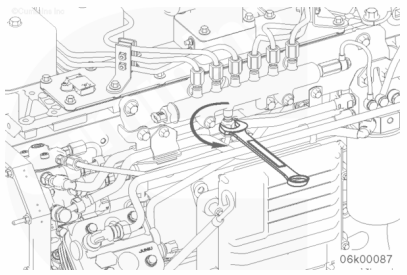
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

Fuel system is extremely sensitive to dirt and debris. All connections and ports must be cleaned and covered. Even a very small amount of debris can result in fuel system malfunction.

- Thoroughly clean the joint area between fuel rail and pump-to-rail lines. Use high-pressure water or contact cleaner, Part Number 3824510, or equivalent. Dry with compressed air.

Relieve Pressure



⚠ WARNING ⚠

Depending on the circumstance, diesel fuel is flammable. When inspecting or performing service or repairs on the fuel system, to reduce the possibility of fire and resulting severe personal injury, death, or property damage, never smoke or allow sparks or flames (such as pilot lights, electrical switches, or welding equipment) in the work area.

⚠ WARNING ⚠

High pressure fuel spray can cause serious injury or death.

⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High-pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.

⚠ CAUTION ⚠

Fuel system is extremely sensitive to dirt and debris. All connections and ports must be cleaned and covered. Even a very small amount of debris can result in fuel system malfunction.

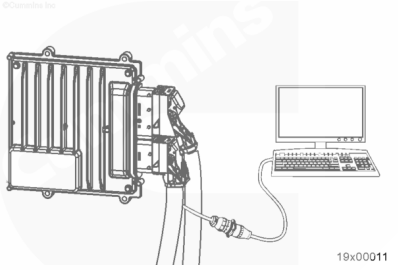
Slowly loosen the pump-to-rail lines at the rail to vent the fuel pressure.

Keep hands clear of the lines when loosening.

Connect INSITE™ electronic service tool to engine data link.

Turn keyswitch to ON position.

Verify fuel pressure has decreased to 0 bar [0 psi] by monitoring Fuel Rail Pressure Measured parameter.



Tighten the fuel rail nut.

Torque Value: 40 n•m [30 ft-lb]

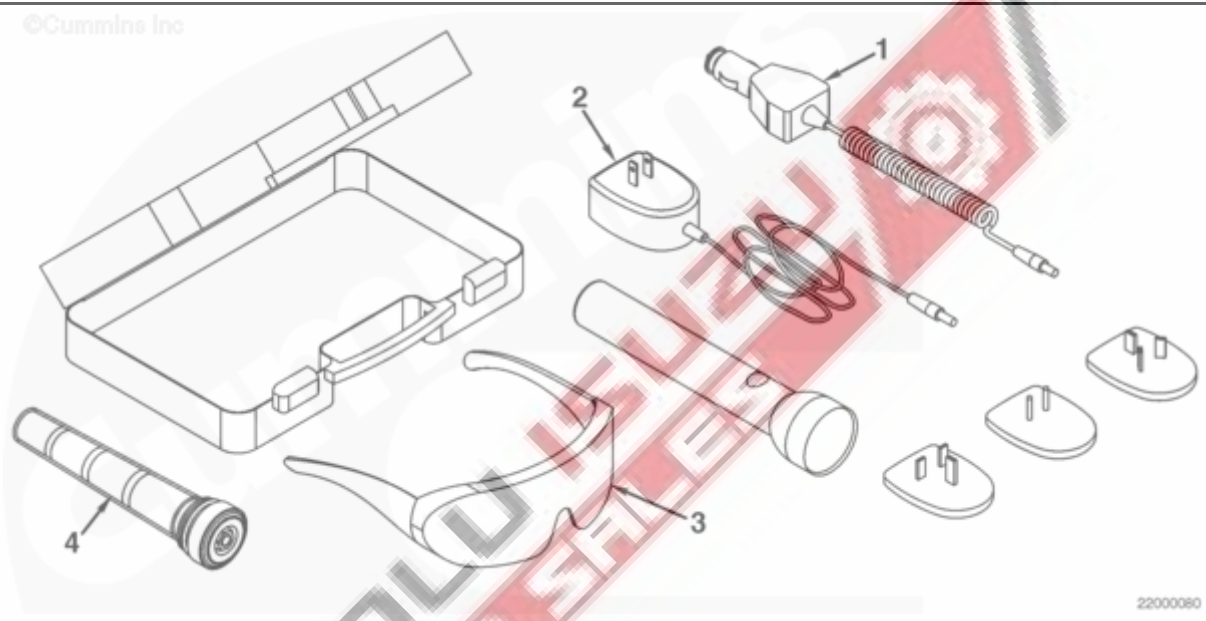
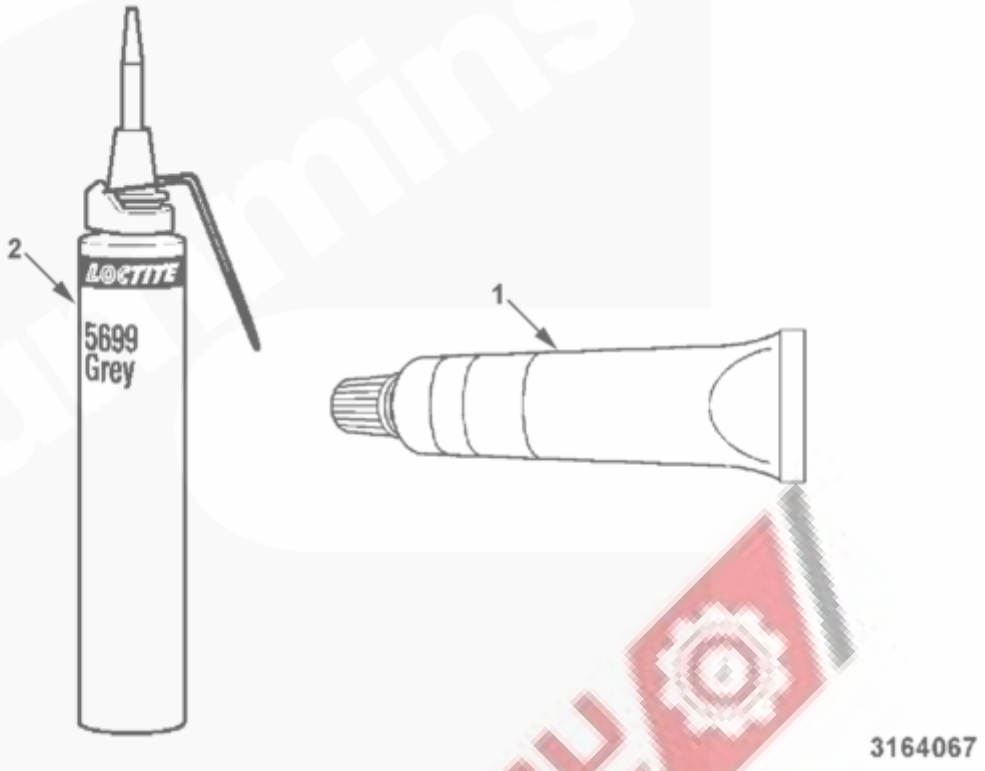
ANADOLU ISUZU
AFTER SALES

Lubricating Oil System

Tool Number 2892320
Black Light Lamp (12 volt) Black light with rechargeable battery and charger used with fluorescent tracer, Part Number 3376891, to locate oil leaks.


Tool Number 3164067
Silicone Sealant Loctite® 5699 Grey RTV silicone sealant is very durable and was released to be used for multiple applications. It can provide a seal in the T-gasket joint on oil pan gaskets.

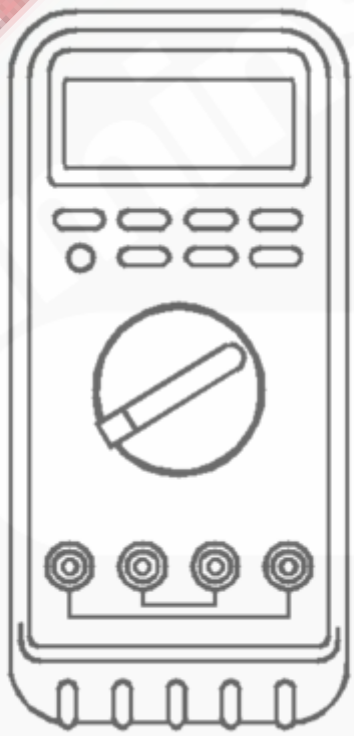


Tool Number

3164489

Deluxe Digital Multimeter

This digital multimeter includes the functions of frequency, capacitance, and temperature (with a built-in temperature module). Also included are these functions: RPM, Dwell, Duty Cycle, and Pulse Width and comes with test leads, protective boot, inductive pick-up, bead-type temperature probe. Nylon carrying case available separately, Part Number 3164497.

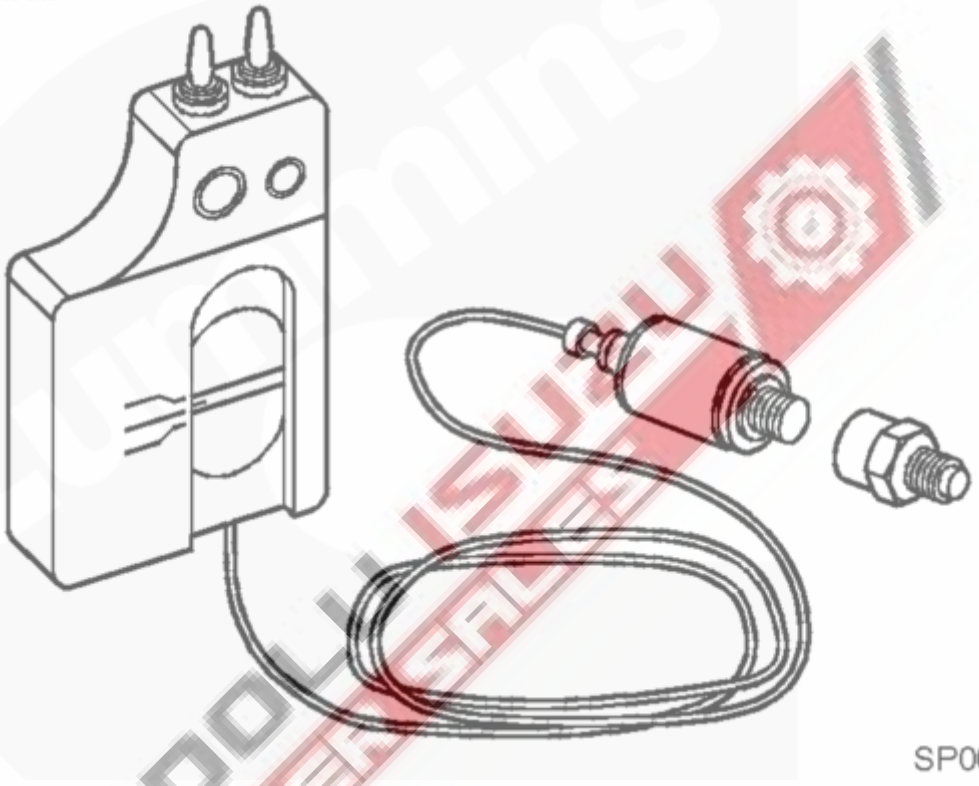


Tool Number

3164491

Pressure/Vacuum Adapter

This pressure/vacuum adapter is used with digital multimeter, Part Number 3164488, or deluxe digital multimeter, Part Number 3164489, to measure up to 500 psi pressure and vacuum to -30in-hg. By using this unit as specified, it is an excellent way to obtain digital pressure or vacuum readings in many applications within the range mentioned.

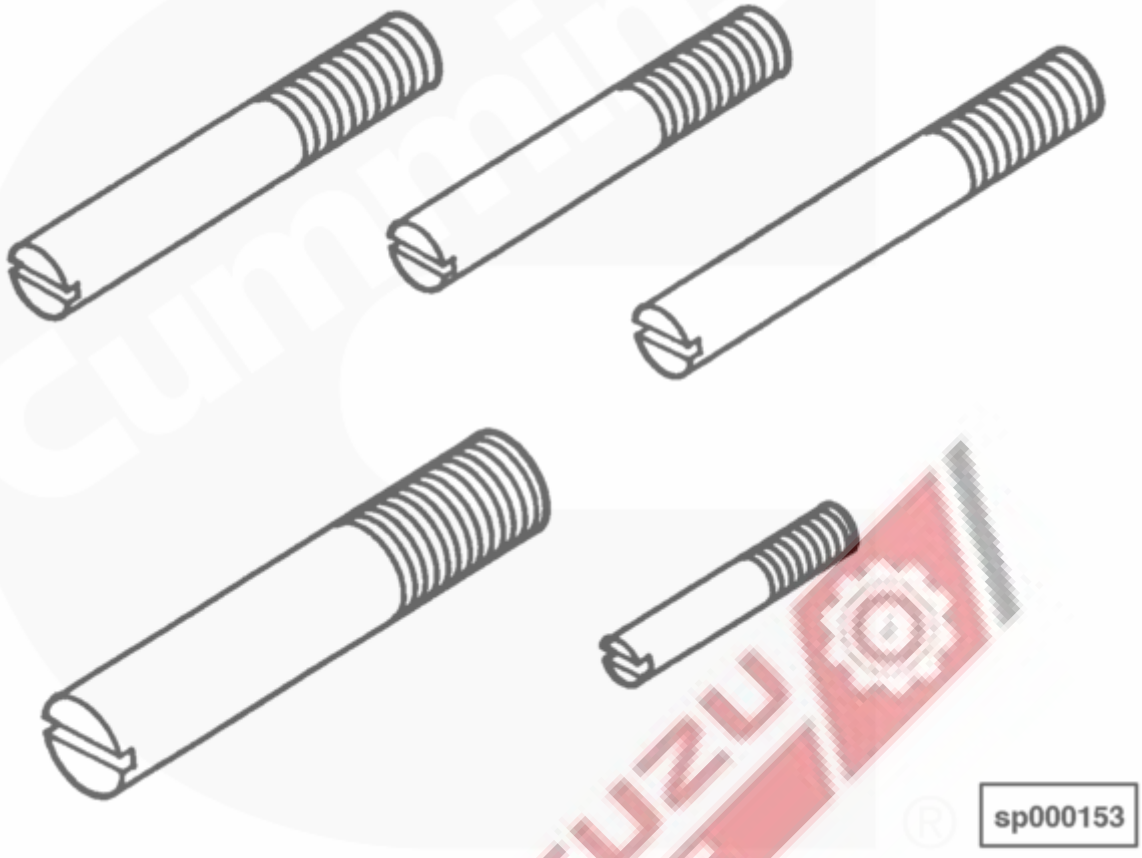


Tool Number

3164977

Guide Pins

These various size guide pins are used during assembly and/or disassembly to align parts and aid in the control of the parts. The use of one or more guide pins can `free-up' a hand to turn capscrews etc.

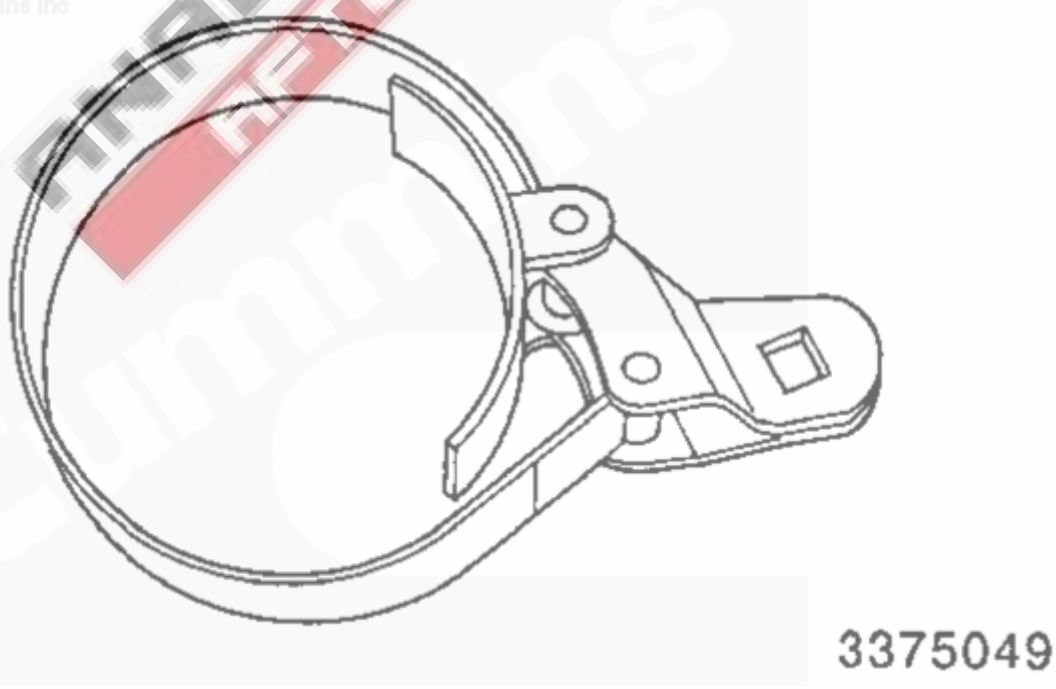


Tool Number

3375049

Oil Filter Wrench

Used to remove the oil filter.

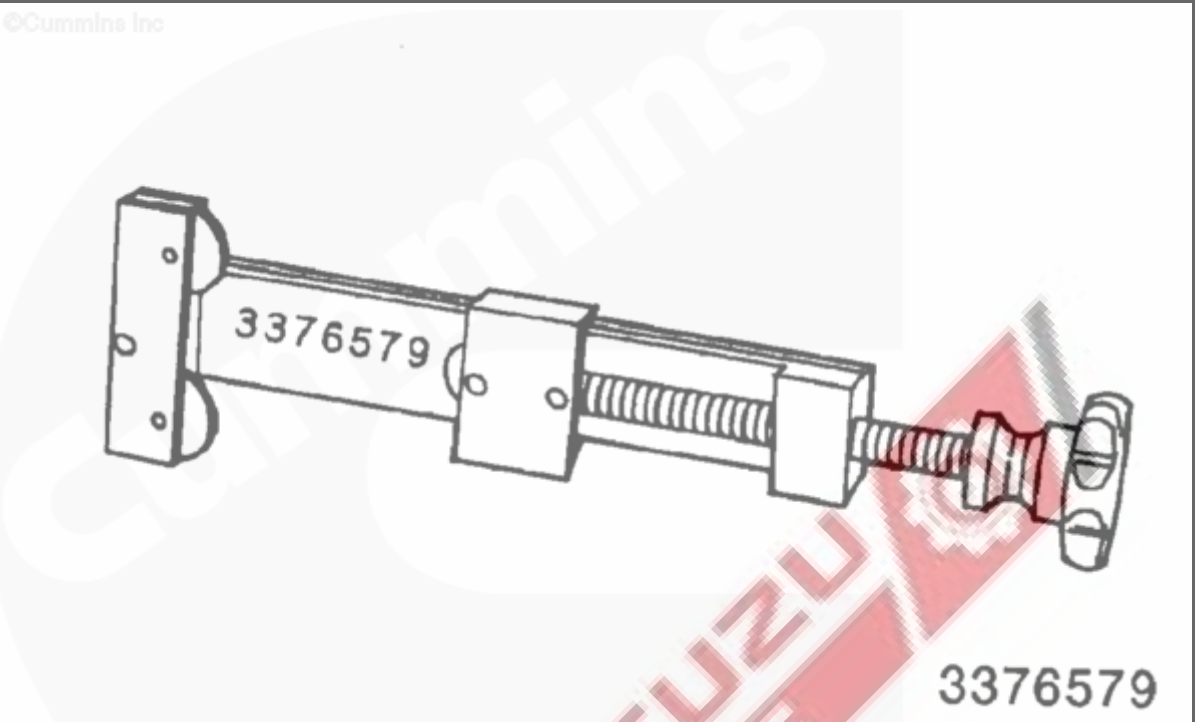


Tool Number

3376579

Tube (Filter) Cutter

Used to cut open the filter to permit inspection of the filter element.



Tool Number

3376891

Fluorescent Tracer

This special dye, when mixed in the cooling system or lubricating system, will help determine the source of leaks. Used with leak test kit, Part Number 2892320, black lights must be used to illuminate the fluorescent dye.

ANADOLU ISUZU AFTER SALES

SP000785

Recommended Cummins® Service Tools

- No Cummins® service tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

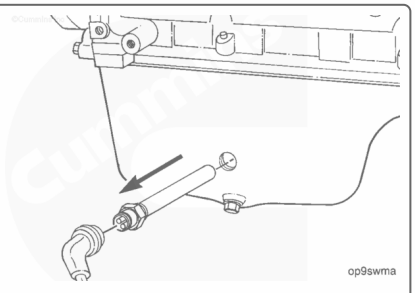
To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)

Remove

Disconnect the oil heater electrical cord.

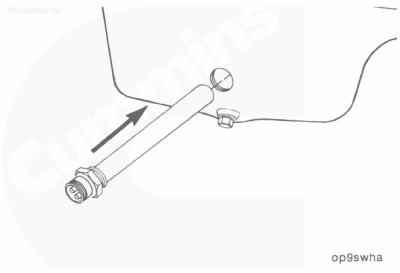
Remove the heater element.



Install

Install the heater element.

Torque Value: 120 n•m [89 ft-lb]



Finishing Steps

- Connect the oil heater electrical cord.
- Fill the engine with lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Operate the engine. Check for leaks.

Recommended Cummins® Service Tools

- Lubricating oil cooler pressure test kit, Part Number 3823876

Additional Service Items

- Brush
- Shop air
- Cleaning Tank
- Screwdriver
- Gasket scraper

Preparatory Steps

⚠ WARNING ⚠

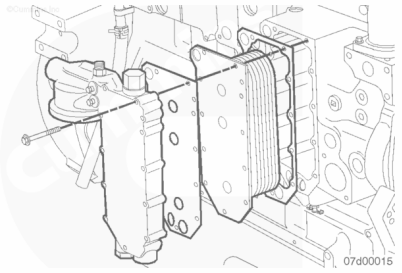
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Clean the area around the lubricating oil cooler cover.
- Remove the lubricating oil filter. Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html)
- Remove the turbocharger oil supply line. Refer to Procedure 010-046 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-046.html)
- Remove the exhaust gas recirculation (EGR) cooler coolant line. Refer to Procedure 011-031 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-031.html)
- Remove the EGR cooler mounting bracket. Refer to Procedure 011-029 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-029.html)

Remove

Remove the lubricating oil cooler cover, gaskets, and oil cooler element.

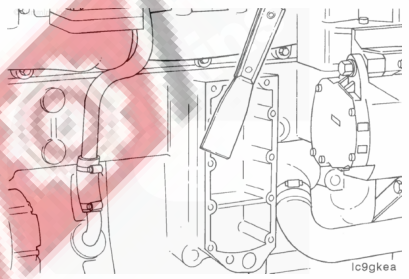
Discard the gaskets.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvent, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ CAUTION ⚠

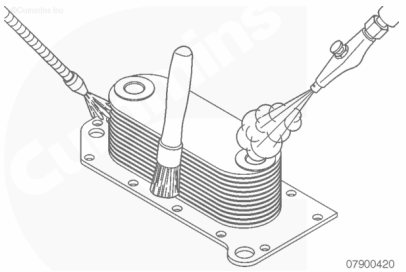
Use a solvent that will not harm copper to clean the oil cooler elements.

Clean the sealing surfaces of the cylinder block and the oil cooler cover.

Note : Replace the lubricating oil cooler if any debris is found in the lubricating oil filter, or if the engine has had a debris-generating malfunction that introduced debris into the lubricating oil system.

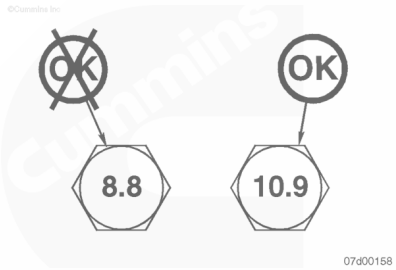
⚠ CAUTION ⚠

Do not reuse an oil cooler core after a debris related engine malfunction since there is no practical method for cleaning the cooler core. Metal particles which can circulate through the lubricating oil system can remain in the cooler core and cause engine damage.



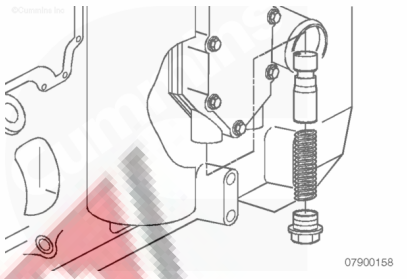
Inspect the capscrews. If they are Grade 10.9 or higher, they can be reused.

If the capscrews are lower than Grade 10.9, they **must** be replaced with Grade 10.9 or higher capscrews.



07d00158

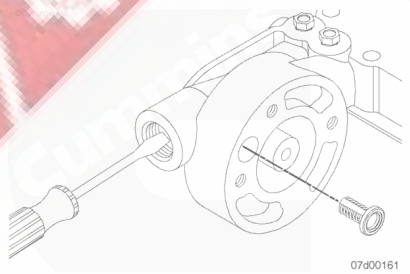
If any debris is suspected to have gone through the engine, or if troubleshooting a lubricating oil pressure issue, remove and inspect the lubricating oil pressure regulator located in the lubricating oil cooler cover. Replace if necessary. Refer to Procedure 007-029 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-029.html)



07900158

If any debris is suspected to have gone through the engine, inspect the oil filter bypass valve located in the lubricating cooler cover. Make sure the valve is fully seated and opens and closes freely. Replace, if necessary.

The bypass valve requires a 345 kPa [50 psi] pressure differential to open.



07d00161

Leak Test

Pressure test the element to check for leaks. If leaks are detected, replace the element.

Air Pressure Test		
kpa		psi

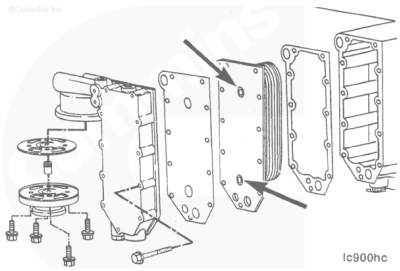
Install

Note : Make sure to remove the shipping plugs from a new oil cooler element.

ANADOLU ISUZU AFTER SALES

Assemble the lubricating oil cooler gaskets, element, and cover. Use new gaskets.



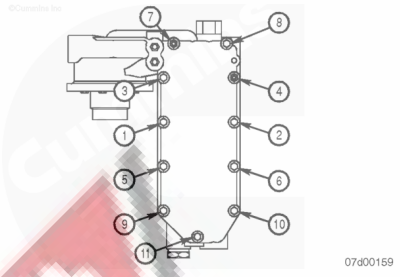
Tighten the capscrews in the sequence shown.

Torque Value:

1. 15 n•m [11 ft-lb]
2. 33 n•m [24 ft-lb]

Retorque capscrews 1 and 2 by using the torque value listed below:

Torque Value: 33 n•m [24 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the EGR cooler mounting bracket. Refer to Procedure 011-029 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-029.html)
- Install the EGR cooler coolant line. Refer to Procedure 011-031 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-031.html)
- Install the turbocharger oil supply line. Refer to Procedure 010-046 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-046.html)
- Install the lubricating oil filter. Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

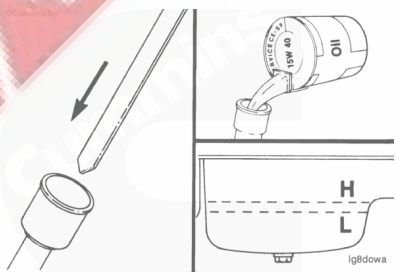
Additional Service Items

- No additional service items required.

Calibrate

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and can cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.



⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)

Install the dipstick in the dipstick tube housing.

Use clean lubricating oil to fill the oil pan to the specified LOW oil level. Refer to Procedure 018-017 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-017.html)

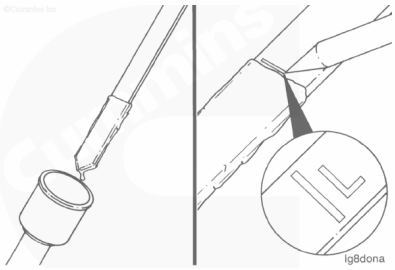
⚠ CAUTION ⚠

Use care when marking the dipstick. The dipstick will break if the scribe mark is too deep.

ANADOLU ISUZU SPARE PARTS SALES

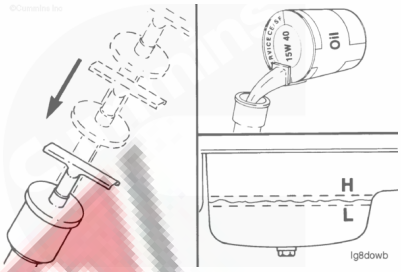
Remove the dipstick. Scribe a mark across the stick at the oil level. Label the mark with an L to indicate the "LOW" oil level.

Note : If a new blank dipstick is being used, cut the dipstick off approximately 38 mm [1.5 in] below the LOW oil level mark.



Wipe off the dipstick. Install it in the dipstick tube housing.

Use clean lubricating oil to fill the oil pan to the specified HIGH oil level. Refer to Procedure 018-017 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-017.html)



⚠ CAUTION ⚠

Use care when marking the dipstick. The dipstick will break if the scribe mark is too deep.

Remove the dipstick. Scribe a mark across the stick at the oil level. Label the mark with an H to indicate the HIGH oil level.

Last Modified: 27-Jul-2016

Select Service Tools

Recommended Cummins® Service Tools

- Sleeve retaining compound, Part Number 3823718, or equivalent

Additional Service Items

- Dent puller
- M8 x 1.25 x 21 mm self-tapping capscrew

Preparatory Steps

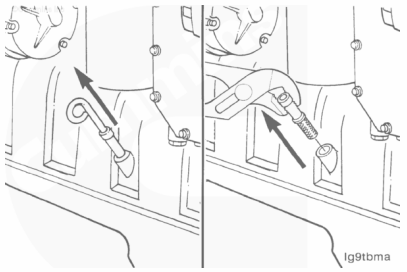
- Clean the area around the dipstick tube before removal to prevent debris from entering the oil system.

Remove

Remove the dipstick from the dipstick tube.

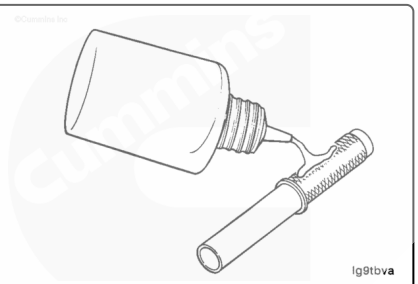
Remove the dipstick tube from the cylinder block.

Service Tip: Use a dent puller and a M8 x 1.25 x 21 mm self-tapping capscrew. Thread the capscrew into the dipstick tube. Remove the tube.



Install

Apply a thin bead of sleeve retaining compound, Part Number 3823718, or equivalent, around the bottom of the knurled end of the tube.



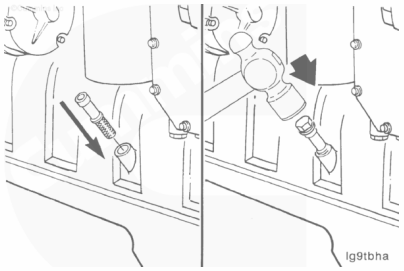
ANADOLU ISUZU GENUINE SALES

Place the knurled end of the tube into the dipstick tube bore in the cylinder block.

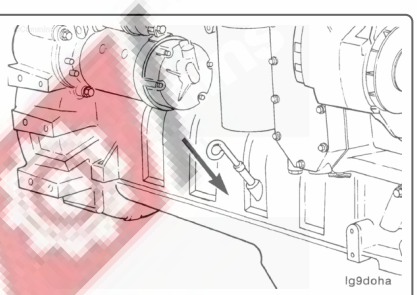
Use a flat washer and hex head capscrew to drive the tube into the cylinder block.

Lightly drive the dipstick tube until it seats against the block casting.

Remove the flat washer and hex head capscrew.



Install the dipstick into the dipstick tube.



Finishing Steps

- Operate the engine. Check for leaks.

Last Modified: 27-Jul-2016

Select Service Tools

Recommended Cummins® Service Tools

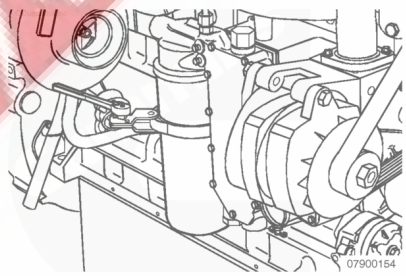
- Oil filter wrench, Part Number 3375049, or equivalent

Additional Service Items

- No additional service items required.

Measure

Remove the oil plugs from the lubricating oil cooler housing at the filter inlet and outlet pressure ports and install manual gauges.



The following parts, or equivalent, are available for use:

Part Number	Description
3377244	Compuchek™ fitting (1/8 inch 27 NPT)
3376920	Compuchek™ coupling (1/4 inch pipe thread)
3164491	Electronic pressure adapter for multimeter (1/4 NPT pipe)
3164488 or 3164489	Electronic digital multimeter
Engine Information	
Oil Filter Type	
Miles on Filter	
Oil Type	

Operate the engine at each rpm indicated. Record the corresponding pressure values:

	Engine RPM	Oil Pressure Filter Inlet	Oil Filter Pressure Outlet	Inlet - Outlet = Differential Pressure	INSITE™ electronic service tool
Low Idle					
High Idle					

A pressure drop greater than 172 kPa [25 psi], at operating temperature using engine oil, indicates the filter is plugged.

Identify the causes of a plugged filter. Verify Cummins Inc. maintenance guidelines are being met.

Use the following procedure to check for possible fluid contamination. Refer to Procedure 007-083 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-083.html)

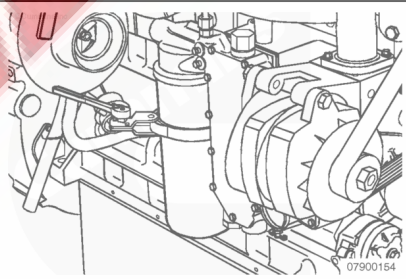
Change both the lubricating oil and the lubricating oil filter, if the filter is plugged.

See the following bulletin for additional information about lubricating oil filter plugging. Refer to Service Bulletin, Cummins® Engine Oil and Oil Analysis Recommendations, Bulletin 3810340. (/qs3/pubsys2/xml/en/bulletin/3810340.html)

Remove

⚠ CAUTION ⚠

Use caution when replacing filters that oil is not spilled or drained into the bilge area. Do not drop or throw filter elements into the bilge area. The oil and oil filters must be discarded in accordance with local environmental regulations.



Clean the area around the lubricating oil filter head.

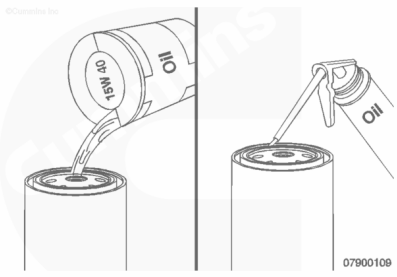
Remove the lubricating oil filter. Use oil filter wrench, Part Number 3375049, or equivalent.

Clean the gasket surface of the filter head. Use a clean lint-free cloth.

Install

⚠ CAUTION ⚠

The lubricating oil filter should be full of oil at start-up to prevent engine damage.



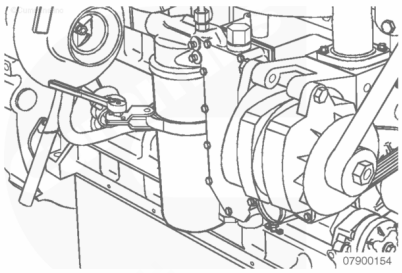
Use clean engine oil to coat the gasket surface of the filter.

Fill the filter with clean engine oil.

Note : Lubricating oil filters **must** have a filter bypass valve. Using a lubricating oil filter without a filter bypass valve will result in low engine oil pressure if the filter becomes plugged.

⚠ CAUTION ⚠

Mechanical overtightening of the filter can distort the threads or damage the filter element seal.



Install the filter on the oil filter head. Tighten the filter until the gasket contacts the filter head surface.

Use an oil filter wrench to tighten the filter. See filter manufacturer instructions supplied with the filter.

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

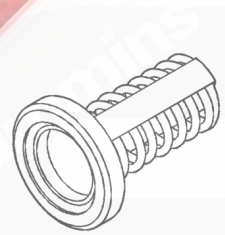
- Screwdriver

General Information

If the pressure drop across the lubricating oil filter exceeds a predetermined set point, the oil filter bypass valve opens and allows lubricating oil to bypass the lubricating oil filter.

This condition can occur during cold ambient (cold lubricating oil) engine start-ups.

The purpose of the bypass valve is to maintain lubricating oil flow to the engine and prevent an oil filter collapse.



07d00160

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

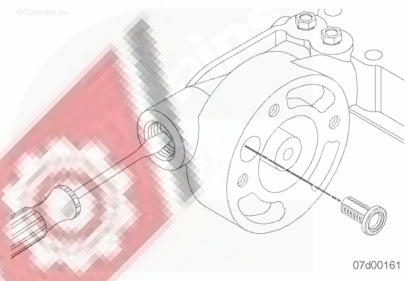
- Disconnect the batteries. See equipment manufacturer service information.

- Remove the lubricating oil filter. Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html)
- Remove the lubricating oil filter head. Refer to Procedure 007-015 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-015.html)
- Remove the 3/4-inch pipe plug from the end of the oil filter head.

Remove

Remove the 3/4 inch pipe plug from the end of the oil filter head.

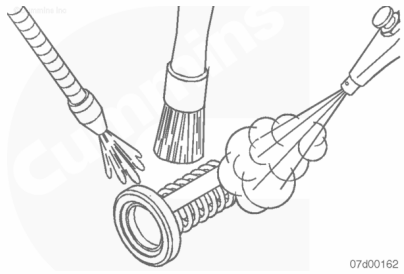
Gently push down on the top of the bypass valve to remove it from the bore. Use a screwdriver.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

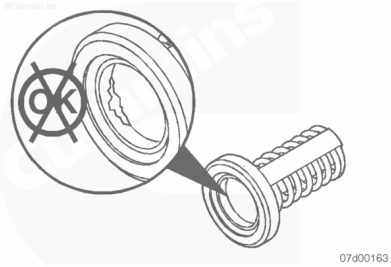
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the bypass valve. Use solvent. Dry with compressed air.

ANADOLU ISUZU PARTS SALES

Inspect the bypass valve seat for damage. Make sure the valve fully closes.



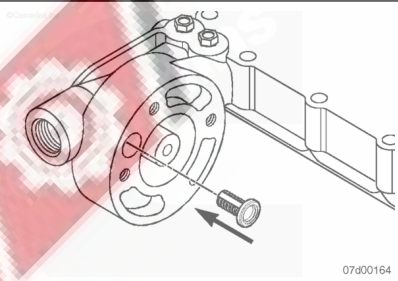
Install

Insert the bypass valve into the bore. The spring should be pointing upward into the bore.

Gently push the bypass valve into the bore until it seats.

Install the 3/4 inch pipe plug into the end of the oil filter head.

Torque Value: 45 n•m [33 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the lubricating oil filter head. Refer to Procedure 007-015 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-015.html)
- Install the lubricating oil filter. Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html)

Last Modified: 01-Nov-2016

Select Service Tools

Recommended Cummins® Service Tools

- Flourescent tracer, Part Number 3376891
- Black Light Kit, Part Number 3163338

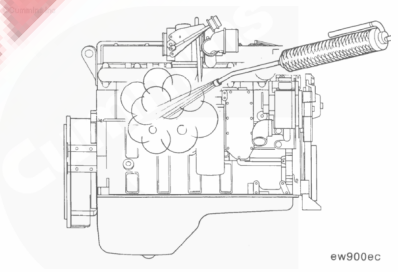
Additional Service Items

- No additional service items required.

Initial Check

⚠ WARNING ⚠

Wear safety glasses or a face shield, as well as protective clothing, to prevent personal injury when using a steam cleaner or high-pressure water.

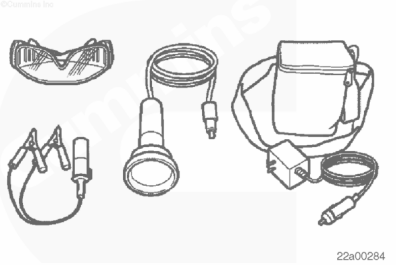


Clean the engine. Use a steam cleaner or high-pressure washer.

Add fluorescent tracer, Part Number 3376891, before running the engine.

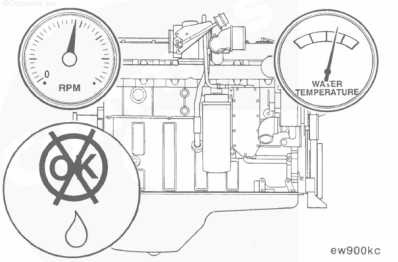
Use Black Light Kit, Part Number 3163338, to help identify the source of an oil leak.

The tracer will be highlighted by the black light to help identify the source of the oil leak.



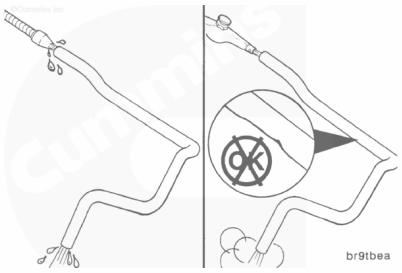
Operate the engine until the coolant temperature reaches 82°C [180°F]. If necessary, run the engine under load to create the conditions of the oil leak. Perform stall tests or a road test. Inspect the exterior of the engine for leaking gaskets, seals, o-rings, pipe plugs, or fittings.

Note : Before replacing any gaskets, check the capscrews to make sure they are tightened to the correct torque values.



ANADOLU ISUZU PARTS SALES

Inspect the engine crankcase breather tube and hose for restriction or leaks. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)



Check for a loose or missing oil dipstick tube, dipstick, or oil fill cap.

Recommended Cummins® Service Tools

- Sealant, Part Number 3164067, or equivalent
- Guide pins, Part Number 3164977 - Quantity 3

Additional Service Items

- Utility or putty knife

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

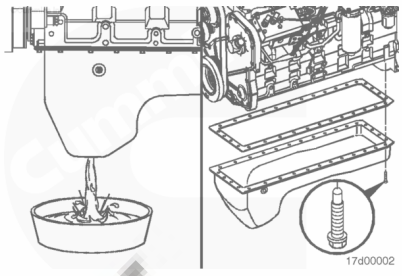
Note : The engines use a variety of combinations of gaskets and/or RTV for sealing. When installing the oil pan, use the same combinations of gasket and/or RTV that were on the pan.

- Disconnect the batteries. See equipment manufacturer service information.
- Inspect the area around the lubricating oil pan plug. If there are signs of leakage, the lubricating oil pan plug sealing washer needs to be replaced.
- Drain the lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)

Remove

⚠ CAUTION ⚠

Do not use a prybar or screwdriver to remove the oil pan. The lubricating oil pan flange can be damaged if a prybar or screwdriver is used to break the sealant at the corners of the oil pan. Use a utility knife or the edge of a putty knife to cut the seal and loosen the pan.



Remove the lubricating oil pan and gasket.

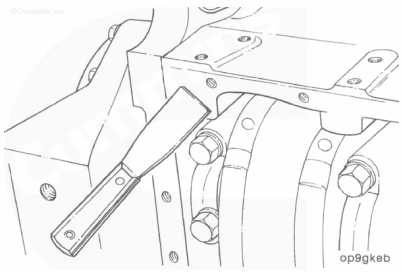
Remove the suction tube, if necessary. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)

Remove the block stiffener plate, if equipped. Refer to Procedure 001-089 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-089.html)

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

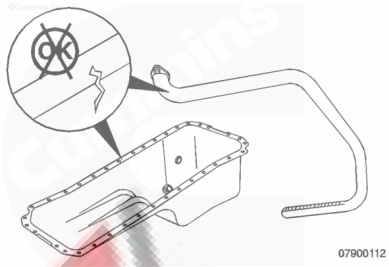
Do not use air or power tools, such as a high speed sander with an abrasive pad, to clean the gasket material from the oil pan. Air or power tools can overheat the oil pan and cause damage to the sealing flange.

ANADOLU ISUZU PARTS SALES

Remove all gasket material from the cylinder block and lubricating oil pan surface.

Clean the lubricating oil pan. Use steam. Dry with compressed air.

Note : If cracks or other damage is found, replace the damaged part. Do **not** attempt to repair the oil pan by welding.

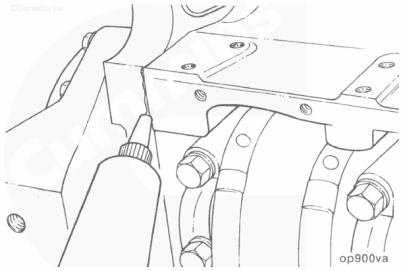


Inspect the oil pan, suction tube, and tube braces for cracks or other damage.

Use the following procedure if the suction tube **must** be replaced. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)

Install

Note : The engines use a variety of combinations of gaskets and/or RTV for sealing. When installing the oil pan, use the same combinations of gaskets and/or RTV that were on the pan.



Note : To achieve a proper seal, gaskets should not be reused.

Note : If the engine is equipped with a block stiffener plate, it is recommended that paper gaskets not be used for sealing.

Apply a 4 mm [1/8 in] bead of sealant, Part Number 3164067, or equivalent, to the oil pan mounting surfaces at the cylinder block to front gear cover joints and the cylinder block to rear gear housing joints.

Note : Install the oil pan within 10 minutes of applying the sealant, or it will **not** seal correctly. Once installed, allow the sealant to dry for a minimum of 30 minutes before running the engine.

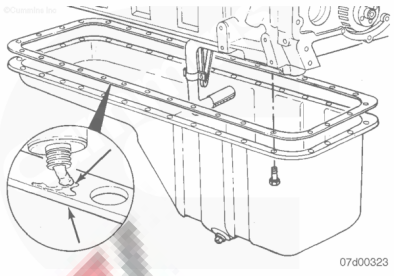
Install the suction tube, if applicable. Refer to Procedure 007-035 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-035.html)

Note : Install three guide pins, Part Number 3164977, to improve the alignment of the oil pan sealing components to the cylinder block. It is recommended

to install two of the guide pins at opposite corners and one in the middle.

Install the block stiffener, if applicable. Refer to Procedure 001-089 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-089.html)

Install the gasket and lubricating oil pan.



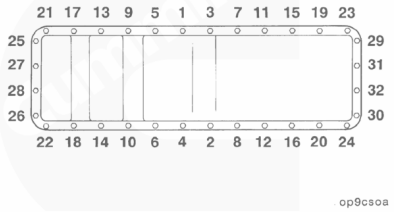
Service Tip: To aid in installation of the gasket, apply a small amount of sealant, Part Number 3164067, or high tack spray adhesive to the gasket and oil pan flange. This will help hold the gasket in place during assembly.

If RTV sealant is used to seal the oil pan, apply a 4 mm [1/8 in] bead of sealant, Part Number 3164067, or equivalent, to the oil pan flange and around the bolt holes.

Install the oil pan corner braces, if equipped.

Note : Install the oil pan within 10 minutes of applying the sealant, or it will **not** seal correctly. Once installed, allow the sealant to dry for a minimum of 30 minutes before running the engine.

Assemble the washers and capscrews to secure the lubricating oil pan, as illustrated.

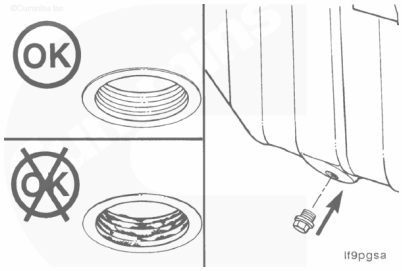


Tighten all capscrews in the sequence shown in the accompanying chart.

Torque Value: 28 n•m [248 in-lb]

Note : Make sure to follow the torque sequence shown. This allows for minimal assembly strains and evenly distributes pressure along the oil pan flange. Failure to follow the torque sequence can lead to a cracked oil pan or joint leaks.

Clean and check the lubricating oil drain plug threads and sealing surface.



Install a new sealing washer if the lubricating oil pan plug was leaking or if the sealing washer is damaged.

Install and tighten the lubricating oil pan drain plug.

Torque Value:
Steel Pan, M18 Plug 60 n•m [44 ft-lb]

Torque Value:
Steel Pan, M22 Plug 80 n•m [59 ft-lb]

Torque Value:
Cast Aluminum Pan, M18 Plug 60 n•m [44 ft-lb]

Torque Value:
Cast Aluminum Pan, M22 Plug 60 n•m [44 ft-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Fill the lubricating oil system. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

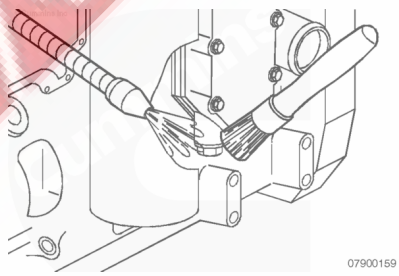
Remove

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



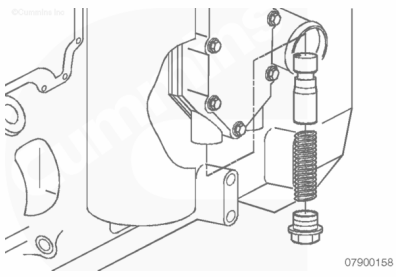
⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

Thoroughly clean the area around the pressure regulator plug with clean solvent to prevent debris from falling into the plunger bore when the plug is removed.

Remove the threaded plug, spring, and plunger.

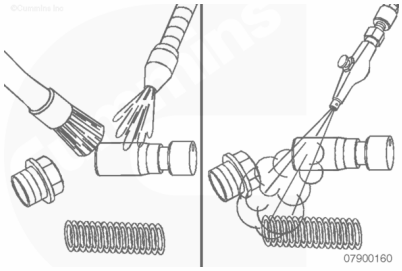
Service Tip: The plunger normally can be removed by inserting one finger into the plunger bore until snug and pulling down. If the plunger can **not** be removed in this manner, the plunger is probably stuck and will require removal of the housing for cleaning the plunger.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

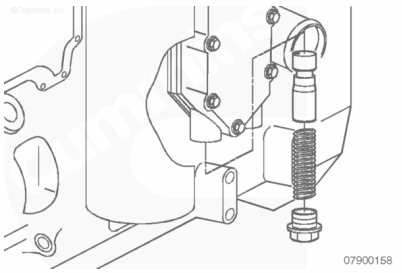
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

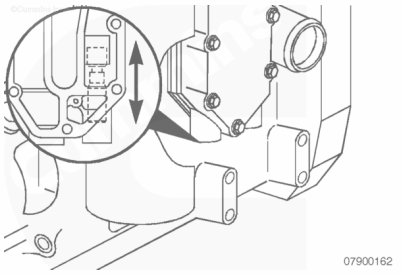
Note : If the plunger bore requires cleaning, remove the housing to avoid flushing debris into the engine.

Thoroughly clean all components. Use clean solvent. Dry with compressed air.

Inspect the plunger and plunger bore. Polished areas on the plunger and bore are acceptable.



Verify the plunger moves freely in the bore.



ANADOLU ISUZU AFTER SALES

Install

Install a new sealing o-ring on the threaded plug. Lubricate with clean engine oil. Install the pressure regulator assembly.

Torque Value: 80 n•m [59 ft-lb]

Preparatory Steps

⚠ WARNING ⚠

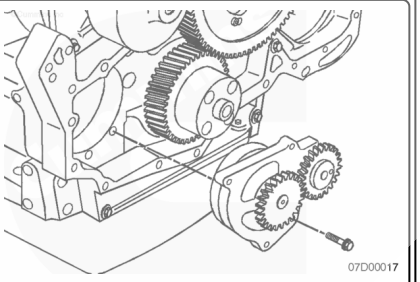
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the rubber vibration damper, if installed. Refer to Procedure 001-051 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-051.html)
- Remove the viscous vibration damper, if installed. Refer to Procedure 001-052 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-052.html)
- Remove the front cover. Refer to Procedure 001-031 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-031.html)

Remove

Remove the four mounting capscrews.

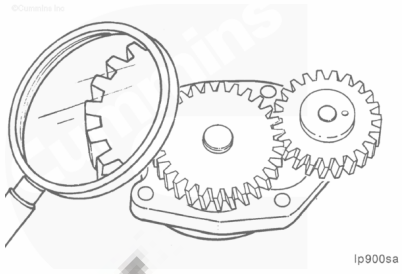
Remove the lubricating oil pump from the bore in the cylinder block.



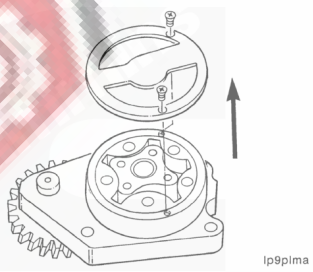
Disassemble

If the lubricating oil pump is to be inspected for reuse, follow these steps.

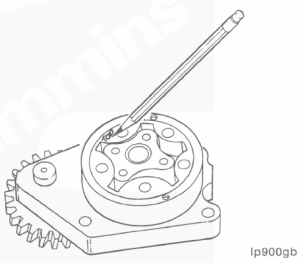
Inspect the lubricating oil pump gears for chips, cracks, or excessive wear.



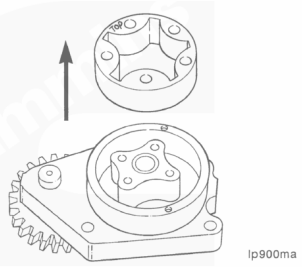
Remove the back plate.



Mark TOP on the gerotor planetary.



Remove the gerotor planetary.

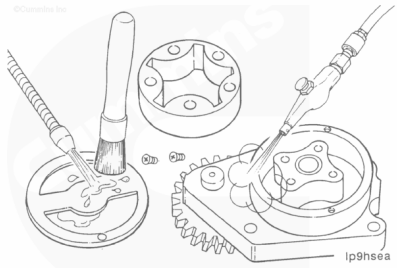


Clean and Inspect for Reuse

⚠ WARNING ⚠

ANADOLU ISUZU AFTER SALES

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

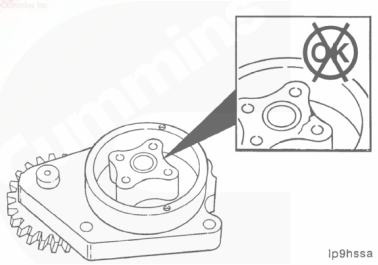
Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean all parts. Use solvent. Dry with compressed air.

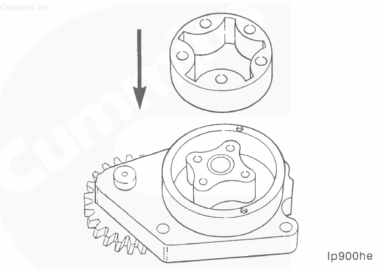
Inspect the lubricating oil pump housing, gerotor drive, and gerotor for damage and excessive wear.



Measure

⚠ CAUTION ⚠

Make sure that the gerotor planetary is installed in the original position.



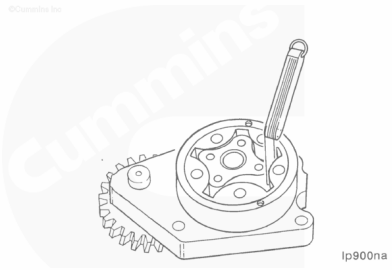
Install the gerotor planetary.

Measure the tip clearance.

Tip Clearance		
mm		in
0.0254	MIN	0.001

ANADOLU ISUZU AFTER SALES

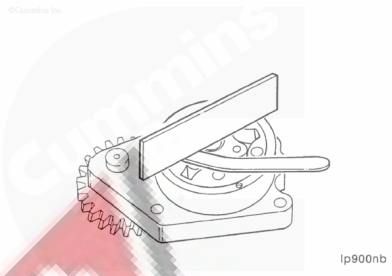
Tip Clearance		
mm		in
0.1778	MAX	0.007



Replace the lubricating oil pump if the tip clearance is out of specification.

Measure the clearance of the gerotor drive/gerotor planetary to port plate.

Gerotor Drive/Gerotor Planetary to Port Plate Clearance		
mm		in
0.0254	MIN	0.001
0.1270	MAX	0.005



Replace the lubricating oil pump if the geroter drive/geroter planetary to port plate clearance is out of specification.

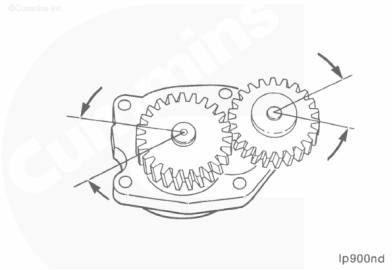
Measure the clearance of the gerotor planetary to the body bore.

Gerotor Planetary to Body Bore Clearance		
mm		in
0.1778	MIN	0.007
0.3810	MAX	0.015

Replace the lubricating oil pump if the geroter planetary to body bore clearance is out of specification.

Measure the backlash.

Lubricating Oil Pump Gears Backlash Limits (Used Pump)		
mm		in
0.0762	MIN	0.003
0.3302	MAX	0.013

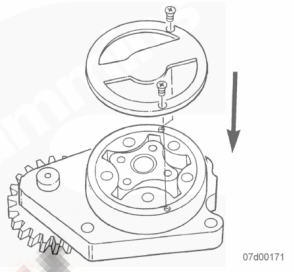


Note : Hold the adjoining gears to keep them from moving when checking backlash or else the reading will be the total of both gears.

Replace the lubricating oil pump if the gear backlash is out of specification.

Assemble

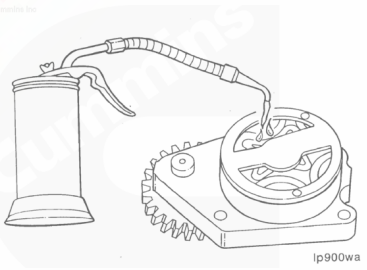
Install the back plate.



Install

⚠ CAUTION ⚠

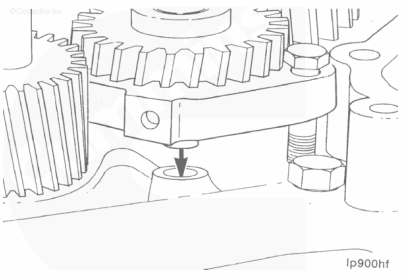
Failure to fill the pump with oil at installation can result in the lubricating oil pump not priming at initial engine start-up, resulting in severe engine damage.



Lubricate the lubricating oil pump. Use clean engine oil.

⚠ CAUTION ⚠

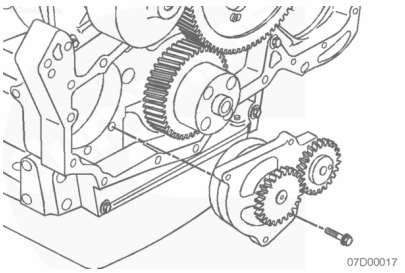
Make sure the idler gear pin is installed in the locating bore in the cylinder block.



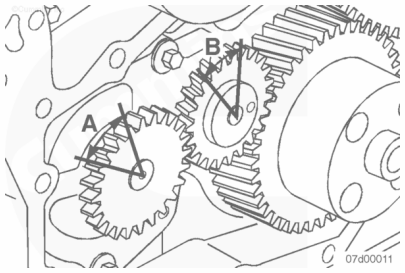
Install the lubricating oil pump.

Tighten the capscrews in a crisscross pattern, starting with the upper right capscrew.

Torque Value: 24 n•m [212 in-lb]



Note : Make sure the gear backlash is correct if installing a new lubricating oil pump.



Measure the gear backlash.

Lubricating Oil Pump Gears Backlash Limits (Installed)			
	mm		in
A	0.0762	MIN	0.003
	0.3302	MAX	0.013
B	0.0762	MIN	0.003
	0.3302	MAX	0.013

Note : If the adjoining gear moves when you measure the backlash, the reading will be incorrect.

Lubricate the front gear train. Use clean engine oil.

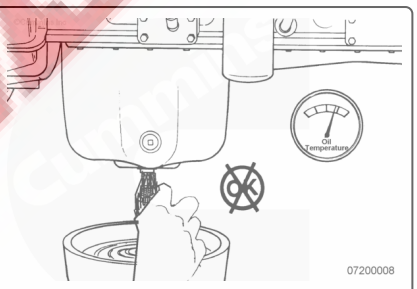
Drain

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.



⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

Note : Use a container that can hold at least 28.4 liters [30 qt] of lubricating oil.

- Operate the engine until the coolant temperature reaches 60°C [140°F]. Shut the engine OFF.

Note : Make sure to remove the front and rear oil drain plugs, if equipped. Failure to do so will result in incomplete draining of oil from the lubricating oil pan.

- Remove the oil drain plug.
- Drain the oil immediately to make sure all the oil and suspended contaminants are removed from the engine.
- If performing an oil drain as part of a service maintenance interval, remove and replace the oil filter. Refer to Procedure 007-013 in Section 7.

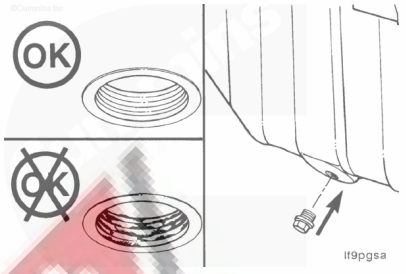
(/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html)

Fill

Clean and check the lubricating oil drain plug threads and sealing surface.

Install the lubricating oil pan drain plug.

Torque Value: 50 n•m [35 ft-lb]

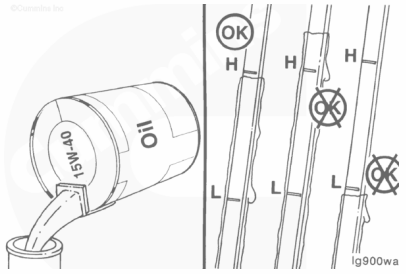


Note : Use a high quality, multi-viscosity oil, such as Cummins® Premium Blue™, or equivalent, in Cummins® engines. Use the following procedure in the L9 CM2350 L119B Operation and Maintenance Manual, Bulletin 5411268. Refer to Procedure 018-003 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-003.html)

Fill the engine with clean lubricating oil to the proper level.

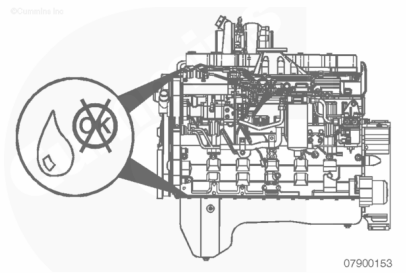
Note : When filling the oil pan, use the fill tube on the side of the engine rather than on top of the rocker lever cover.

Verify lubricating oil pan capacities. Refer to Procedure 018-017 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-017.html)



⚠ CAUTION ⚠

If no oil pressure is noted within 15 seconds after the engine is started, shut down the engine to reduce the possibility of internal engine damage.



Idle the engine to inspect for leaks at the drain plug.

Shut the engine OFF. Wait approximately 10 minutes to let the oil drain from the upper parts of the engine. Check the level again.

Add oil as necessary to bring the oil level to the "H" (high) mark on the dipstick.

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

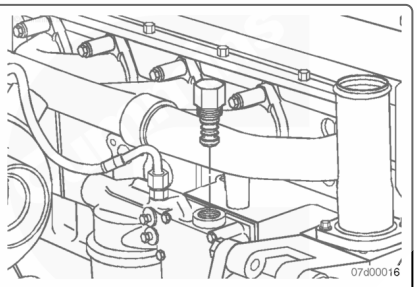
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment befoe servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the exhaust gas recirculation (EGR) cooler mounting bracket. Refer to Procedure 011-029 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-029.html)
- Some applications can require removal of the EGR coolant return line to the water inlet connection. Refer to Procedure 011-031 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-031.html)
- Clean the area around the lubricating oil thermostat to prevent debris from entering the system.

Remove

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.



⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

⚠ CAUTION ⚠

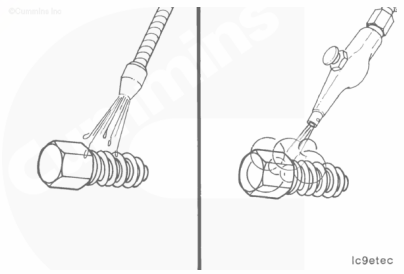
Use caution when draining lubricating oil that is not spilled or drained into the bilge area. The lubricating oil must be disposed in accordance with local environmental regulations.

Remove the lubricating oil thermostat.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

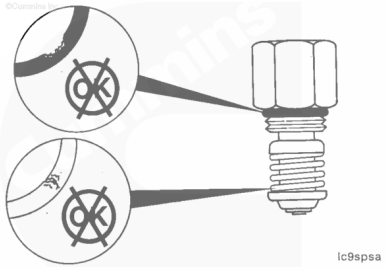
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the thermostat. Use solvent. Dry with compressed air.

Inspect for a damaged o-ring, broken spring, or other damage.

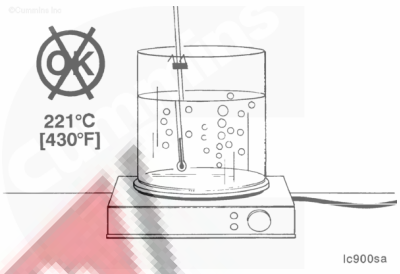
If any damage is found, the component must be replaced.



Ic9spsa

⚠ WARNING ⚠

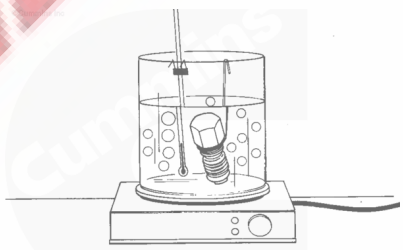
The flash point of new lubricating oil is approximately 221°C [430°F]. Do not allow oil temperature in the container to exceed 150°C [300°F]. Do not allow water droplets to enter the container of hot oil. Water droplets will cause a violent reaction, that can cause personal injury.



Ic900sa

Suspend the thermostat and a 116°C [240°F] thermometer in a container of new lubricating oil. Do **not** allow the thermostat or the thermometer to touch the sides of the container.

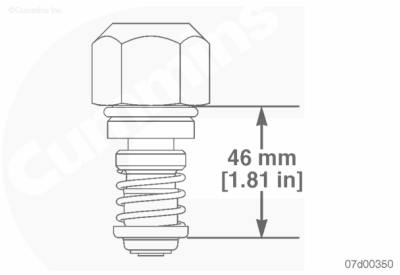
Heat the lubricating oil.



Ic900sb

Note : Record the temperature when the thermostat is fully extended. The thermostat **must** be fully extended at least 46 mm [1.81 in] when the temperature reaches 116°C [240°F].

Replace the thermostat if it does **not** operate as described.

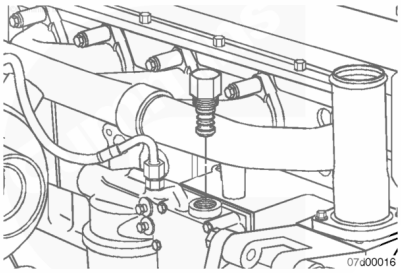


07d00350

Install

Install the lubricating oil thermostat.

Torque Value: 50 n•m [37 ft-lb]



07d00016

Last Modified: 03-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- Flourescent tracer, Part Number 3376891
- Black light, Part Number 3163337, or equivalent

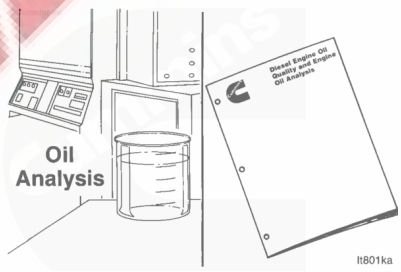
Additional Service Items

- No additional service items required.

General Information

A used oil analysis can help diagnose internal damage and determine if it was caused by one of the following:

- Oil diluted with coolant
- Oil diluted with fuel.

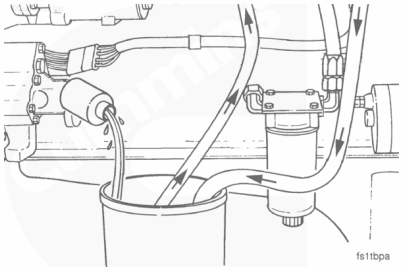


Fluorescent Dye Tracer

Note : This test is **not** effective on a cold engine, less than 21°C [70°F] coolant temperature, or with a loose overhead setting.

Install an isolated fuel supply tank at the fuel inlet supply line and at the fuel drain line.

Add fluorescent tracer, Part Number 3376891, or equivalent, to the isolated fuel supply tank. See the instructions on the fluorescent tracer bottle for the proper tracer-to-fuel ratio.

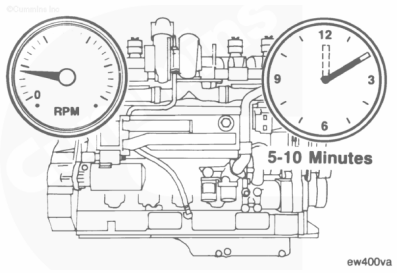


- Connect INSITE™ electronic service tool.
- Start the engine.
- Operate the engine at idle for 3 minutes.
- After 3 minutes, use INSITE™ electronic service tool High-Pressure Leakage Test to create high fuel rail

pressure.

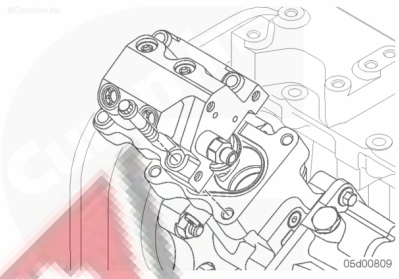
- Operate the engine at high fuel pressure for 3 minutes.
- Shut the engine down.

Note : Do **not** allow the engine to operate from a remote fuel source for more than 10 minutes.



⚠ WARNING ⚠

Normal engine operation creates highly pressurized fuel in the fuel line which will remain in the fuel line after engine shutdown. Never open the fuel system when the engine is operating. Before servicing the fuel system, always loosen the pump to rail fuel line at the rail to vent the pressure. Keep hands clear of the line when loosening. High pressure fuel spray can penetrate the skin, resulting in serious personal injury or death.



Remove the fuel pump head. Refer to Procedure 005-227 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-227.html)

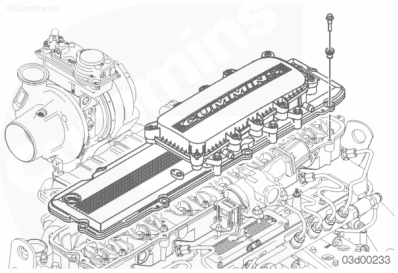
Use black light, Part Number 3163337, or equivalent, to inspect the camshaft housing for signs of fuel. Fuel will appear to be yellow if present.

Note : Do **not** remove the springs. A small amount of fuel on the pumping plungers is normal.

If there are signs of a significant amount of fuel in the camshaft housing or on the tappet springs, replace the fuel pump head.

Install the fuel pump head. Refer to Procedure 005-227 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-227.html)

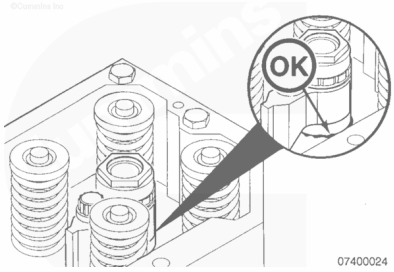
Remove the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)



Use black light, Part Number 3163337, or equivalent, to find fuel leaks from inside or around the injectors.

ANADOLU ISUZU SPARES

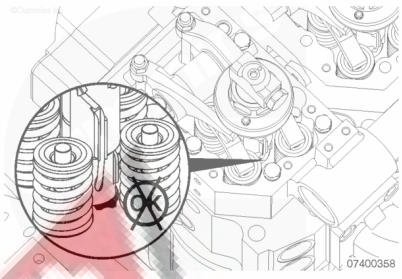
Fuel will appear to be yellow.



If there is excess leakage around the outside of the injector:

- Check the injector hold-down clamp capscrew torque.
- Remove the injectors. Inspect the injector o-rings and injector body for damage.
- Replace the injector o-rings and injector sealing washers if the injector is installed.
- Replace the injector if injector body damage is present.

Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)



Install the rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html)

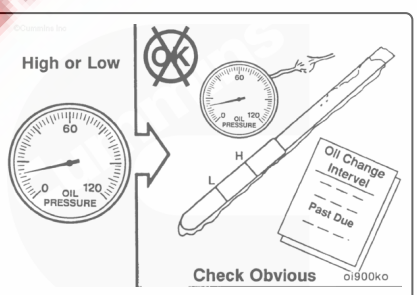
Additional Service Items

- No additional service items required.

General Information

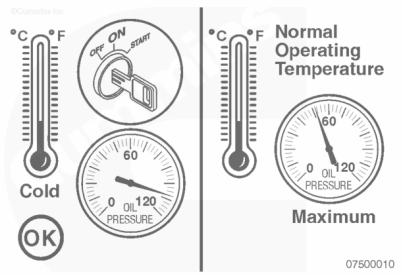
Lubricating Oil Pressure

When the lubricating system malfunctions, check all obvious items related to oil pressure, such as gauges, high and low oil level, excessive oil contamination, and oil viscosity.



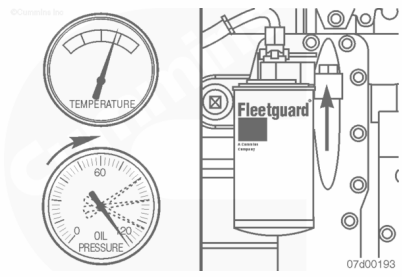
High lubricating oil pressure occurs after the engine is first started in cold weather. Cold-start oil pressure typically will be approximately 689 to 827 kPa [100 to 120 psi].

If the pressure regulator plunger is operating properly, the oil rifle pressure is approximately 379 kPa [55 psi] when normal operating temperature is reached.

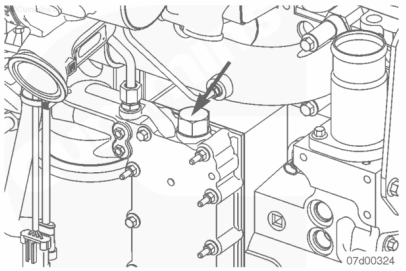


The engine will have high oil pressure at normal operating temperature if the lubricating oil pressure regulator valve sticks in the closed position.

Check the regulator for freedom of movement. Refer to Procedure 007-029 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-029.html)

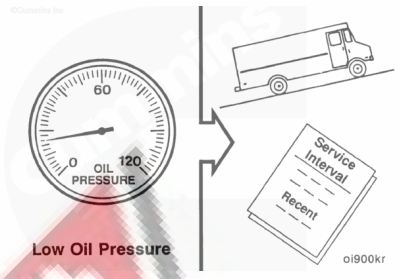


The lubricating oil cooler contains a lubricating oil thermostat which allows the lubricating oil to bypass the oil cooler to regulate the lubricating oil temperature to 116°C [240°F]. Verify oil thermostat operation. Refer to Procedure 007-039 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-039.html)

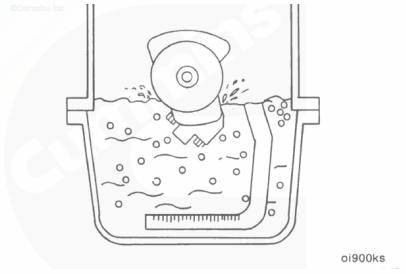


Low lubricating oil pressure (or no oil pressure) can be caused by several lubricating system-related malfunctions. To begin the investigation, determine the engine operating conditions when the low pressure was first observed. The following are possible conditions for low lubricating oil pressure:

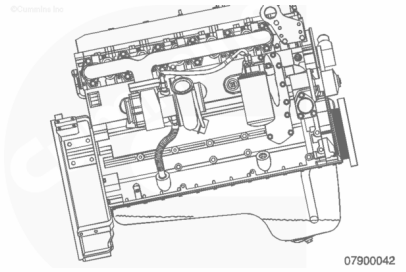
- Following a service interval
- At idle **only**
- Operating on a steep grade
- Operating in rough seas.



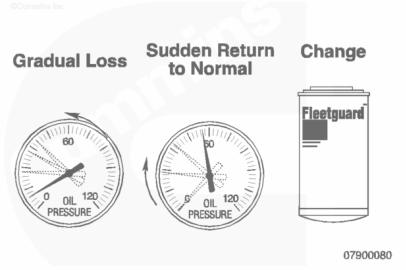
High lubricating oil level can cause low oil pressure. If the oil level is high enough for the connecting rods to dip into the oil while operating, the oil can become aerated, resulting in low oil pressure.



Low oil level will **not** normally appear as low oil pressure. Typically, it will appear as an intermittent loss of oil pressure when rounding a corner or operating on a steep grade. This condition exists when the oil level is extremely low and the suction tube can **not** pick up oil during all modes of operation.

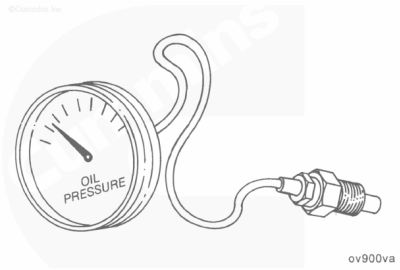


A plugged lubricating oil filter will cause a gradual reduction in oil pressure by approximately 69 kPa [10 psi]. The pressure will return to normal when the filter bypass valve opens. If **not** corrected, this will result in severe engine wear, as the engine is running on unfiltered oil when the bypass valve is open.

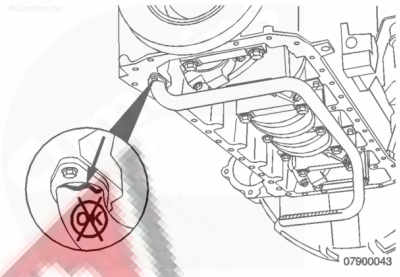


FREEDOM ISUZU TRUCK SALES

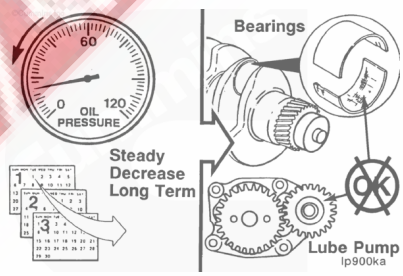
Verify the pressure with a manual gauge to make sure the lubricating oil gauge and sending unit are operating correctly.



A loose lubricating oil suction tube, damaged gasket, or crack in the suction tube can cause a loss of prime for the oil pump. The engine will have low pressure or no oil pressure during starting, possibly followed by normal oil pressure.



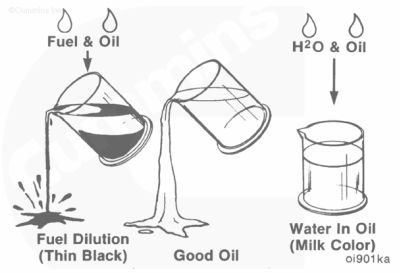
A steady decrease in oil pressure over a long period can be an indication of worn bearings or excessive lubricating oil pump wear.



Lubricating Oil Dilution

⚠ CAUTION ⚠

Using diluted oil can cause severe engine damage.

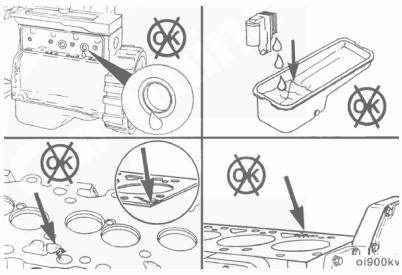


Check the condition of the lubricating oil:

- Thin, black oil is an indication of fuel in the oil
- Milky discoloration is an indication of coolant in the oil.

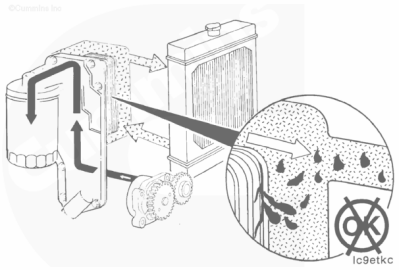
Coolant in the oil can be caused by:

- Expansion plugs leaking
- Oil cooler element leaking
- Damaged cylinder head or gasket
- Cracked engine block
- Casting porosity
- Damaged turbocharger
- Damaged exhaust gas recirculation (EGR) cooler
- Damaged air compressor.



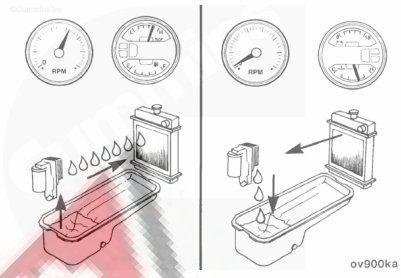
ANADOLU ISUZU
OFFICIAL SALES

There are two places within the oil cooler assembly where oil and coolant could mix, the oil cooler gasket or lubricating oil cooler element. Refer to Procedure 007-003 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-003.html)



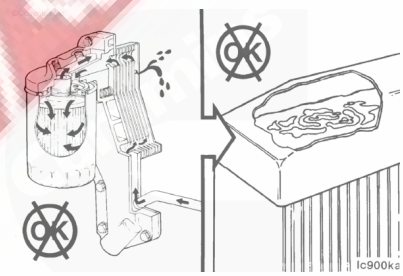
While operating, the oil pressure will be higher than coolant pressure. A leak in the oil cooler will show as oil in the coolant.

However, following an engine shutdown, the residual pressure in the coolant system can cause coolant to seep through the leak path into the oil.



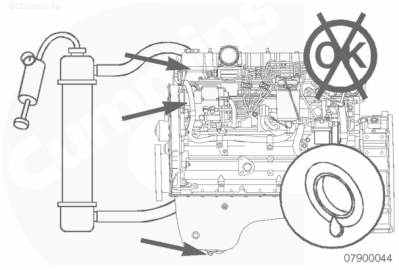
If the oil cooler element ruptures, the oil pressure will force oil into the coolant system.

Oil in the coolant will be visible when the radiator cap is removed. Refer to Procedure 007-003 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-003.html)



To check for leaks, pressurize the cooling system to 140 kPa [20 psi]. With the system pressurized, remove the following components and inspect for leaks:

- Rocker lever cover. Refer to Procedure 003-011 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-011.html) Leaks indicate a cracked cylinder head.
- Lubricating oil drain plug. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html) Leaks indicate a malfunctioning oil cooler or cylinder head gasket, or a cracked cylinder head or block.



Coolant in the lubricating oil can be caused by a damaged cylinder head gasket or a cracked cylinder head or block.

Remove the cylinder head and gasket. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)

Inspect for cracks or any other damage.

Fuel-Diluted Lubricating Oil:

Use the following logic to determine the source of the oil dilution with fuel.

Fuel dilution is limited to three sources:

- Injection pump head
- Fuel leaking past the rings
- Injector leakage.

A cracked or damaged fuel pump head can cause fuel to leak in to the camshaft housing and then in to the lubricating oil pan.

A damaged or missing o-ring seal on the injector(s) can cause fuel dilution of the lubricating oil system. The o-ring seal on the injector seals the injector return fuel in the internal cylinder head drilling.

Incomplete combustion in the cylinders can result in unburned fuel draining into the oil pan.

This condition can be caused by a leaking injector or reduced compression caused by inadequate piston ring sealing.

Lubricating Oil Consumption and Leaks

Various gaskets, seals, and plugs are used to contain the lubricating oil. Most leaks can be identified during routine inspections of the engine and vehicle.

A blown expansion plug can allow a relatively large quantity of lubricating oil to escape, resulting in a sudden drop in the lubricating oil pressure.

When checking for such a leak, make sure to check all expansion plugs visually obscured by chassis parts.

Lubricating oil blowing out of the breather is an indicator of a blown expansion plug.

A Black Light Kit, Part Number 3163338, or equivalent, and fluorescent tracer, Part Number 3376891, or equivalent, **must** be used to verify the source of the oil leak.

ANADOLU ISUZU PARTS SALES

Worn or damaged seals in the turbocharger can also allow oil to leak into the charge air cooler system and be burned in the engine.

The condition can be verified by removing the air crossover tube or charge air cooler tubing and looking for oil. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html) Refer to Procedure 010-027 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-027.html)

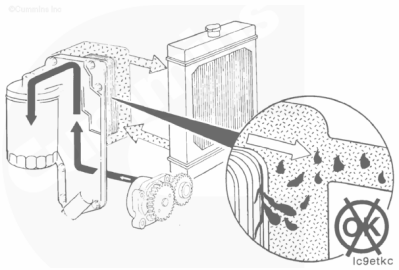
Note : If the engine experiences a turbocharger malfunction or any other occasion where oil or debris is put into the charge air cooler, the charge air cooler must be cleaned and the EGR differential pressure sensor ports must be cleaned. Refer to Procedure 010-027 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-027.html) Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)

Inadequate sealing of the piston rings will result in excessive oil out of the crankcase breather system and/or oil being consumed by the engine.

Lubricating oil can also be lost through a worn or malfunctioning air compressor. Look for carbon buildup in the air line from the compressor to the air tank.

Also, a malfunctioning air compressor head gasket or cylinder head gasket can allow oil to leak into the coolant or coolant to leak into the oil during a hot shutdown.

If the lubricating oil cooler element ruptures, the lubricating oil pressure can force lubricating oil into the cooling system. Lubricating oil in the coolant should be visible when the radiator cap is removed. Refer to Procedure 007-003 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-003.html)



The lubricating oil cooler contains two ports for measuring oil pressure or recording oil pressure drop across the lubricating oil filter. The top port is after the lubricating oil filter, filtered oil pressure port (A). The bottom port is before the lubricating oil filter, unfiltered oil pressure port (B).

Lubricating Oil Filters

The filter is a spin-on element and contains an internal venturi that provides filter bypass oil flow through a stacked disk section of the filter. Lubricating oil filters **must** be of the venturi style. The use of a lubricating oil filter without a venturi will result in premature engine wear.

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

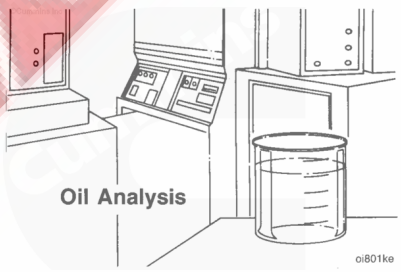
- Tube cutter, Part Number 3376579

Additional Service Items

- No additional service items required.

Inspect

An analysis of used oil can help diagnose internal engine damage and determine if it was caused by one of the following:



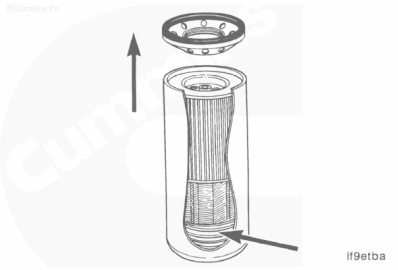
- Intake air filter malfunction
- Coolant leaks
- Oil diluted with fuel
- Metal particles causing wear.

For additional oil analysis information, refer to Service Bulletin, Cummins® Engine Oil and Oil Analysis Recommendations, Bulletin 3810340. (/qs3/pubsys2/xml/en/bulletin/3810340.html)

Note : Do **not** disassemble an engine for repair based solely on the results of an oil analysis. Inspect the oil filters. If an oil filter shows evidence of internal engine damage, find the source of the problem and repair the damage. See the appropriate procedure(s) based on the following oil filter inspection.

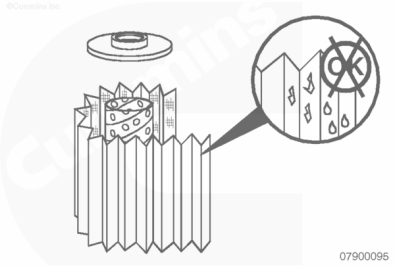
⚠ WARNING ⚠

Restrain the full flow lubricating oil filter and use care when cutting open the upper section of the combination filter. The filter element spring is under compression and can cause personal injury.



Use tube cutter, Part Number 3376579, to open the upper section of the bypass full-flow oil filter.

Inspect the filter element and oil for evidence of moisture or metal particles.



Metal	Possible Source
Copper	Bearings and bushings, lubricating oil cooler[1]
Chromium	Piston rings
Iron	Cylinder liners
Lead	Bearing overlay material
Aluminum	Piston wear or scuffing
[1]Copper leach from the lubricating oil cooler element diminishes significantly after the first oil change maintenance interval.	

Clean and Inspect for Reuse

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

For all other internal engine malfunctions which introduce debris into the lubricating oil system, complete the following:

- Replace lubricating oil filter (spin-on). Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html)
- Replace lubricating oil cooler element. Refer to Procedure 007-003 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-003.html)
- Replace lubricating oil filter bypass valve. Refer to Procedure 007-014 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-014.html)
- Replace lubricating oil thermostat. Refer to Procedure 007-039 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-039.html)
- Special care **must** be taken to be sure these parts are kept extremely clean if removed.
- Do **not** use cleaning agents, other than contact cleaner.
- Clean lubricating oil cooler housing. Refer to Procedure 007-003 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-003.html)
- Clean the lubricating oil pan. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Clean and inspect crankshaft journals for reuse. Refer to Procedure 001-016 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-016.html)
- Remove and inspect the Lubricating oil pump for reuse. Refer to Procedure 007-031 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-031.html)

- If damage is found on number 1 and number 4 rod bearings, roll new connecting rod bearings in on all 6 journals. Refer to Procedure 001-006 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-006.html) Refer to Procedure 001-014 in Section 1 (/qs3/pubsys2/xml/en/procedures/425/425-001-014.html). Otherwise, replace **only** number 1 and number 4 rod bearings.
- Roll new main bearings in on all 7 main journals and new thrust bearings on number 4 main journal.

Finishing Steps

- Install lubricating oil pan and other components removed to access main bearings. Refer to Procedure 007-025 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-025.html)
- Install lubricating oil filter. Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html)
- Prime and fill the engine with new lubricating oil. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)
- Operate the engine to normal operating temperature and check for leaks and proper operation.

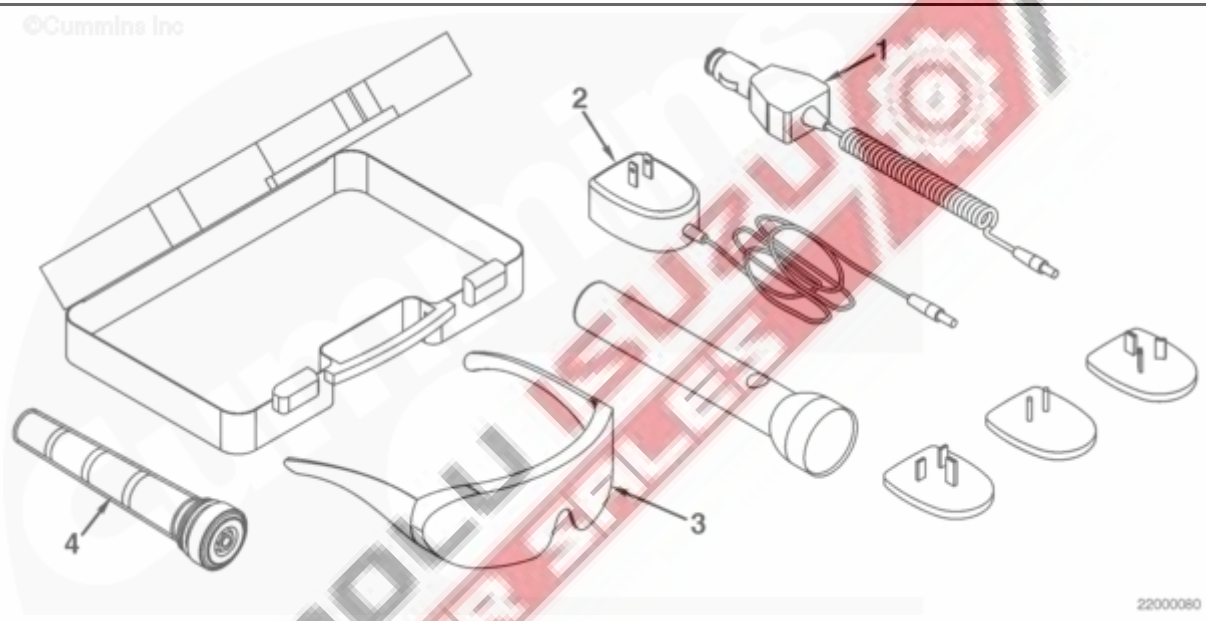
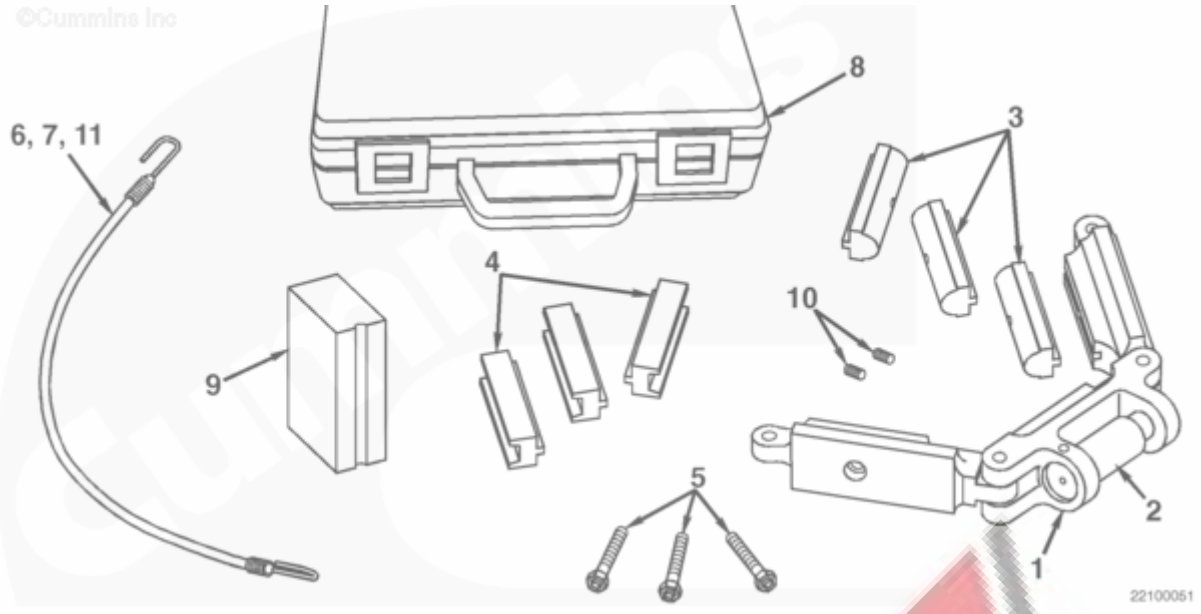
Cooling System

Tool Number 2892320
Leak Test Kit This kit is used to detect leaks in all engine fluid systems (lubrication, coolant, and fuel) using a cordless "True UV" light that will detect the presence of fluorescent dye additive. The kit is also capable of detecting leaks in air conditioning systems, using the appropriate dye.


Tool Number 3163524
Pulley Alignment Tool This fixture allows technicians to use a laser light positioned on one pulley to target a second pulley.



Tool Number

3377438

Fluorescent Tracer

This special dye, when mixed in the cooling system or lubricating system, will help determine the source of leaks. Use with Leak Test Kit, Part Number 2892320, black lights must be used to illuminate the fluorescent dye.

SP000785

Tool Number

3375066

Thread Sealant

This product locks and seals threaded fluid fitting. This product resists leakage, vibration loosening, moisture, hydraulic fluids and diesel fuels and other liquids. It also lubricates the threads for easy assembly and disassembly.

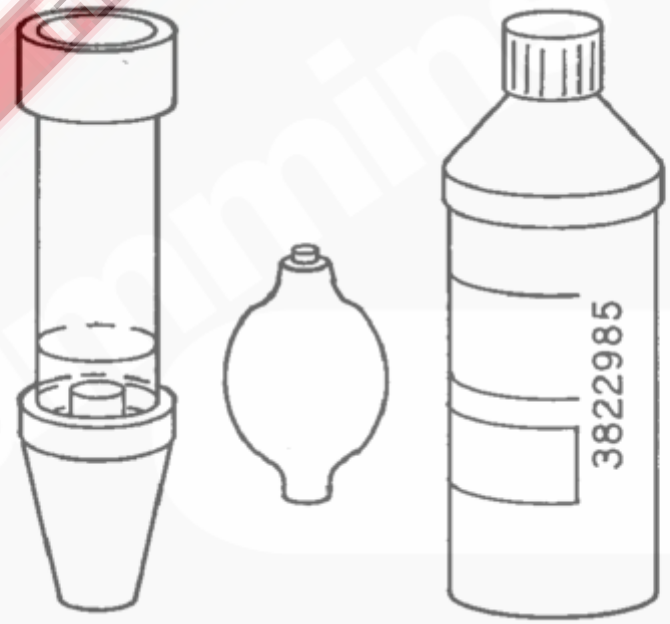
SP000797

Tool Number

3822985

Combustion Gas Leak Test Kit

Used to detect leaks. Includes Part Number 3822986, test fluid, Part Number 3822987, adapter, and Part Number 3877612, instructions.



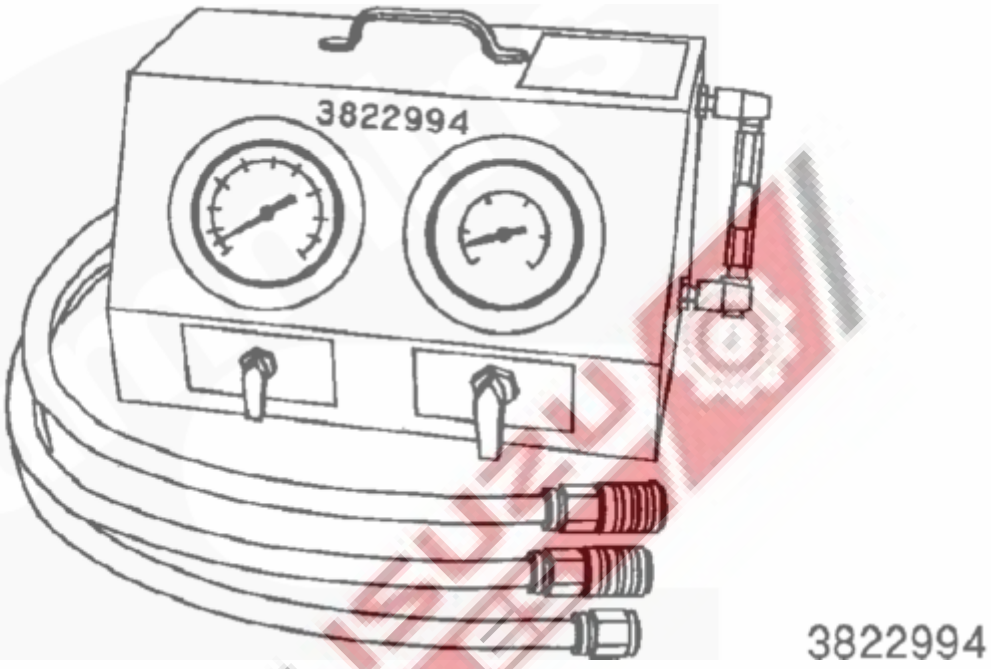
3822985

Tool Number

3822994

Engine Coolant Analyzer

The engine coolant analyzer is used to troubleshoot pressure loss, restriction, and improper temperature control.

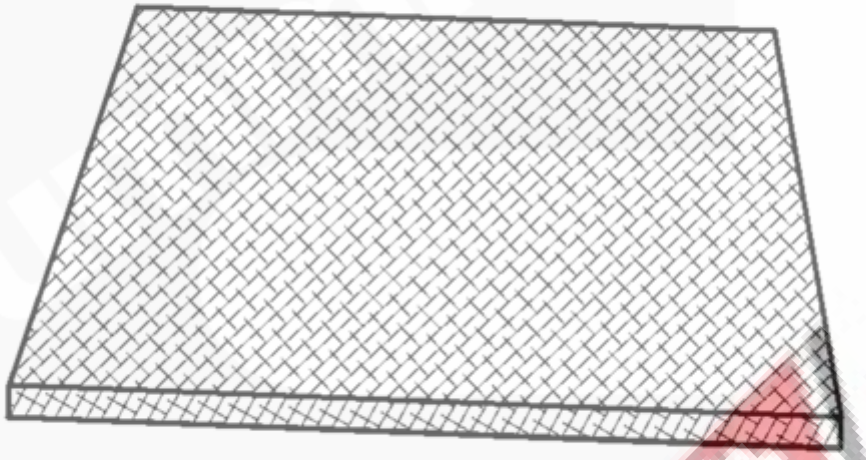


Tool Number

3823258

Abrasive Pad

These pads are used to clean carbon from the upper liner bores, removing rust and corrosion from the engine block and parts, scuffing surfaces prior to painting, and removing burrs from aluminum and other soft metals. These hand cleaning pads are superior to emery cloth or sandpaper, which can inadvertently embed in the metal parts being cleaned. Size: 6” x 9 ½”.



SP000699

Tool Number

3824319

Coolant Dam/Pressure Tester

Using shop air pressure, the coolant dam creates a vacuum, holding the coolant in with little or no coolant loss.

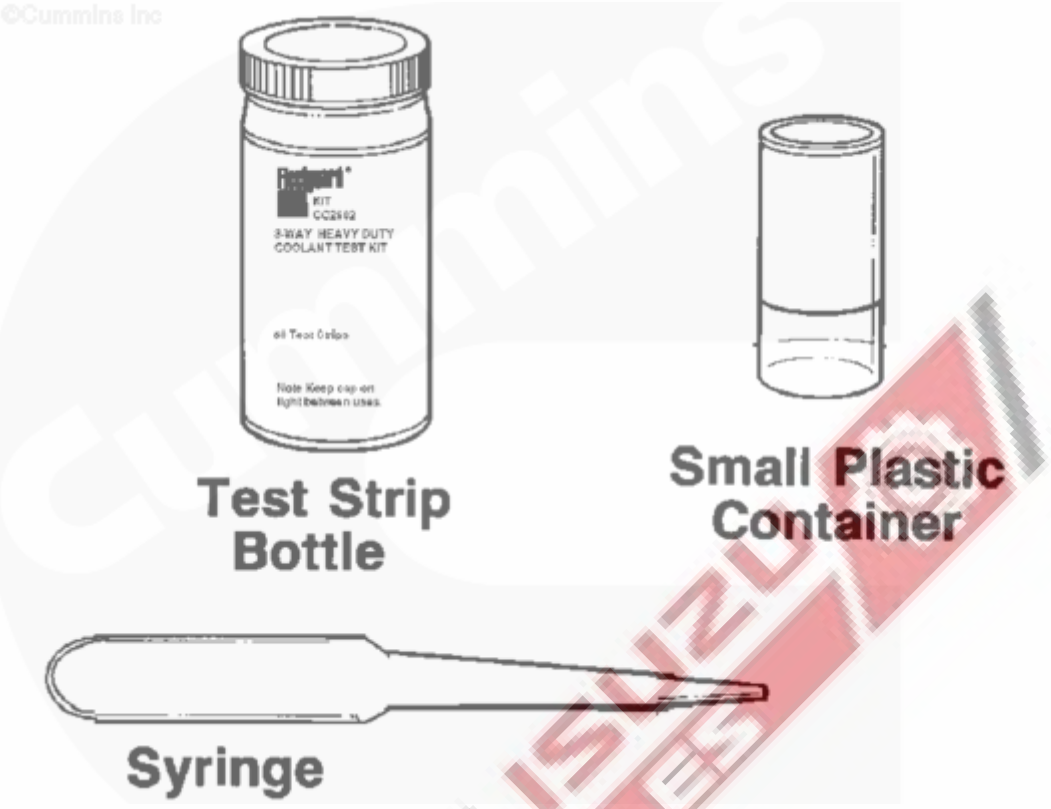
22d00167

Tool Number

CC 2626

Cooling System Test Kit

The Fleetguard® Coolant Test Kit is used to check the concentration of coolant additives in the cooling system.



Tool Number

CC 2800

Refractometer

The Fleetguard® refractometer is used to measure the freezing point protection and antifreeze concentration.

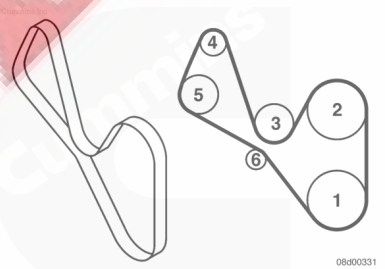
Additional Service Items

- Electronic stethoscope, or equivalent

General Information

Due to the number of drive belt arrangements, this procedure does **not** cover all available cooling fan drive belt routing.

To make sure the cooling fan drive belt is routed correctly upon installation, make a diagram of the cooling fan belt routing prior to removing the belt, as shown in the illustration.



The cooling fan belt routing typically consists of the following components, but may **not** include all of them:

1. Crankshaft pulley/vibration damper
2. Fan pulley
3. Water pump pulley
4. Refrigerant compressor pulley
5. Alternator pulley
6. Belt tensioner pulley.

Note : Some engine-driven belts are installed/supplied by the vehicle original equipment manufacturer (OEM). See equipment manufacturer service information for removal and installation instructions.

Troubleshooting

Note : This content in this section is generic and may **not** apply to all available cooling fan drive belt systems.

The following section contains diagnostic information and procedures to aid in identifying drive belt and accessory drive issues. These issues may include:

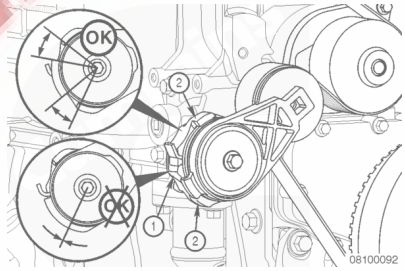
- Belt noise (squeal and chirp)
- Belt tracking (jumping)
- Belt fraying
- Snub breaks and punctures.

Common causes of drive belt noise, fraying, and breaks are:

- Drive pulley misalignment
- Embedded debris in drive pulley grooves
- Incorrect belt material and/or belt length
- Damaged or incorrect automatic belt tensioner
- Improper drive belt routing
- Improper fan size and/or fan clutch.

The original drive belt and tensioner should be used, if possible, while troubleshooting drive belt issues. Replacement of a belt and/or tensioner prior to troubleshooting can mask the root cause of the issue due to the break-in time required for a belt and tensioner.

Note : A newly installed belt and/or tensioner will **not** come to rest properly until the engine is operated. Always operate the engine for a brief period of time prior to verifying the tensioner resting location.

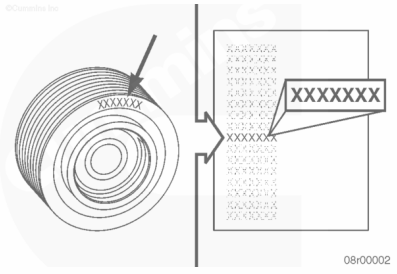


Inspect the automatic belt tensioner. Refer to Procedure 008-080 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-080-tr.html) If the belt tensioner does **not** meet the reuse criteria, the belt tensioner **must** be replaced.

With the belt installed, check the automatic belt tensioner resting position. If the belt tensioner arm stop is contacting either of the spring case stops:

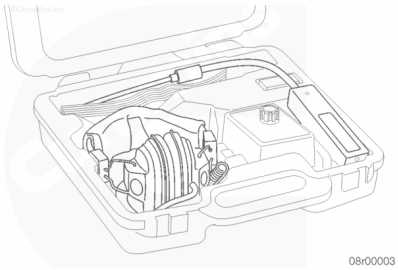
- Verify the correct belt part number is installed.
- If the correct belt is installed, replace the belt.

Verify all accessory drive components and pulleys are correct. Components yielding incorrect part numbers, or installed without the appropriate spacers and/or brackets may contribute to gross drive belt misalignment.

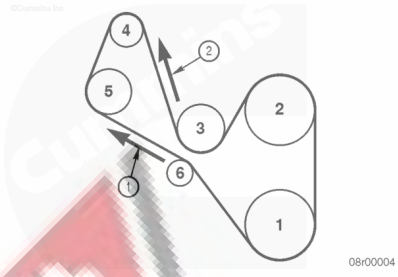


Verify proper drive belt routing, if available. See equipment manufacturer service information.

Isolating the source of drive belt noise can be done by use of an electronic stethoscope, or an equivalent device designed to block audible noise other than that desired, by use of a microphone.



Drive belt noise can be difficult to isolate and troubleshoot. The origin of drive belt noise may **not** be located at the pulley out of alignment, rather ‘upstream’ from the noise origin.

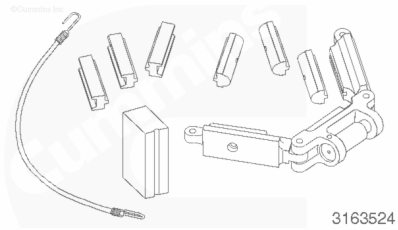


Troubleshooting should always be completed in a direction opposite belt travel (i.e. **counterclockwise**) beginning at the pulley where the noise originates.

Arrow number (1) indicates belt travel direction, whereas arrow number (2) represents the direction in which troubleshooting should be conducted.

- Flat pulleys should be inspected for uneven wear patterns.
- Grooved pulleys should be inspected for embedded debris, belt dust buildup, and pulley alignment.

Note : The belt alignment laser tool can identify misalignment of pulleys down to ½ of a belt rib. The capability of the alignment fixture is contingent upon proper calibration. Make sure all set-up and calibration procedures are followed before verifying pulley alignment.



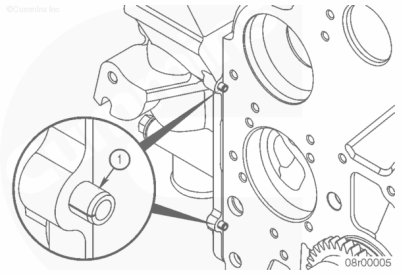
Verify all pulleys are aligned correctly using one of the following pulley alignment fixture tools or equivalent:

- Part Number 3163524
- Part Number 93874 (Dayco)

Pulley alignment should always be checked from the fan pulley, and crankshaft pulley to other front end mounted grooved pulleys. Contact a Cummins® Authorized Repair Location for drive belt alignment.

If a pulley is identified as out of alignment, verify the component mounting bracket installation.

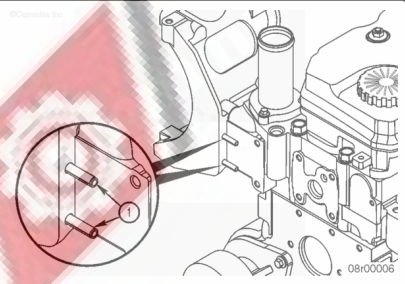
Certain engines feature an automatic belt tensioner mounted to the water inlet connection. Verify the locating roll pins (1) are:



- Installed into the connection
- In contact with the front face of the cylinder block
- Do **not** appear to be bent or out of place.

If the water inlet connection and/or roll pins are **not** installed correctly, remount the water inlet connection. Refer to Procedure 008-082 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-082.html)

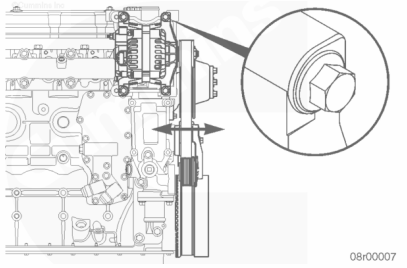
Certain alternator mounting brackets are aligned to the cylinder head by roll pins. Verify the locating roll pins (1) are:



- Installed into the alternator bracket
- In contact with the front face of the cylinder block
- Do **not** appear to be bent or out of place.

If the alternator bracket and/or roll pins are **not** installed correctly, remount the alternator bracket. Refer to Procedure 013-003 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-003.html)

Check drive pulley alignment with belt alignment laser tool, Part Number 3163524, or equivalent, after any bracket adjustments are made.



Certain ‘pad mounted’ components which do **not** contain locating features can be positioned on the mounting brackets for fine adjustments.

Preparatory Steps

⚠ WARNING ⚠

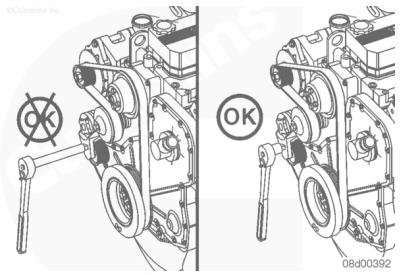
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.

Remove

⚠ CAUTION ⚠

The belt tensioner is spring-loaded and must be pivoted away from the drive belt. Pivoting in the wrong direction can result in damage to the belt tensioner.



⚠ CAUTION ⚠

Applying excessive force in the opposite direction of windup or after the tensioner has been wound up to the positive stop can cause the tensioner arm to crack or break

⚠ CAUTION ⚠

Using a socket extension is not recommended because it can cause axial twisting damage to the belt tensioner.

Lift the tensioner to remove the drive belt.

Note : If a socket extension is necessary, support the head of the ratchet with one hand to prevent the belt tensioner arm from unintended loading.

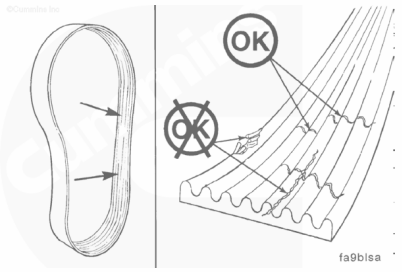
Inspect for Reuse

Inspect the drive belt for damage.

Transverse (across the belt) cracks are acceptable.

Longitudinal (direction of belt ribs) cracks that intersect with transverse cracks are **not** acceptable.

If the belt is frayed, punctured, or material is missing, the belt is unacceptable for reuse and **must** be replaced.



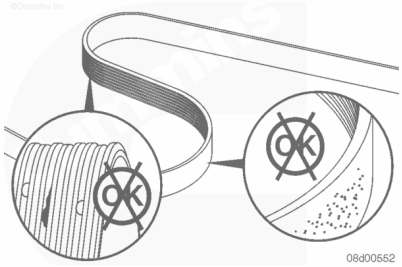
Inspect the belt grooves for:

- Embedded debris
- Uneven/excessive rib wear
- Exposed belt cords.

Inspect the backside of the belt for:

- Glazing (high heat)
- Uneven/excessive rib wear
- Exposed belt cords.

If any of the above conditions are present, the belt is unacceptable for reuse and **must** be replaced.



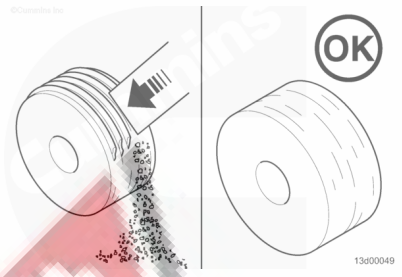
Inspect the idler and drive pulleys for wear or cracks.

Plastic pulleys often have a buildup of road dirt and belt material **not** to be confused with wear.

The dirt can be removed with a suitable tool to check for wear.

Clean, check, and reuse all pulleys in the front end accessory drive if **not** damaged, rather than replacing. Pulleys damaged from embedded debris **must** be replaced.

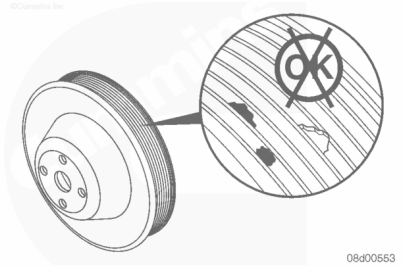
Inspect the tensioner. Refer to Procedure 008-080 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-080-tr.html)



Inspect all system pulleys for embedded debris:

- Rocks, stones
- Metal
- Belt material.

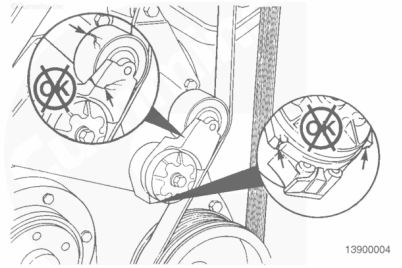
Remove any debris from the grooves of the pulley. If the pulley has been deformed as a result of foreign material embedment, the pulley **must** be replaced.



Inspect the drive belt pulleys and idlers for cracked or broken grooves.

See the following procedures if a pulley or idler is damaged:

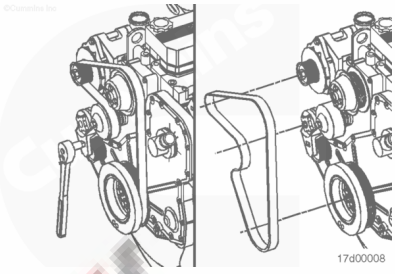
- Inspect the fan pulley. Refer to Procedure 008-039 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-039.html)
- Inspect the crankshaft pulley. Refer to Procedure 001-022 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-022.html)
- Inspect the belt tensioner pulley. Refer to Procedure 008-080 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-080-tr.html)



ANADOLU ISUZU AFTER SALES

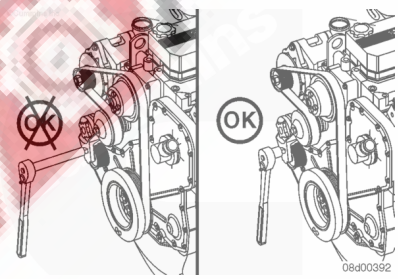
Install

Route the drive belt on the engine. Use the belt diagram created in the Remove section. Do **not** install the belt over the water pump pulley at this time.



⚠ CAUTION ⚠

The belt tensioner is spring-loaded and must be pivoted away from the drive belt. Pivoting in the wrong direction can result in damage to the belt tensioner.



⚠ CAUTION ⚠

Applying excessive force in the opposite direction of windup or after the tensioner has been wound up to the positive stop can cause the tensioner arm to crack or break.

⚠ CAUTION ⚠

A socket extension is not recommended because it can cause axial twisting damage to the belt tensioner.

Pivot the tensioner in the direction of the spring tang. Install the drive belt, slipping the belt over the water pump pulley last.

Slowly, release the belt tensioner to apply tension to the drive belt.

Note : If a socket extension is necessary, support the head of the ratchet with one hand to prevent the belt tensioner arm from unintended loading.

Check the alignment of the belt with the tensioner and the rest of the front-end accessory drive.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for belt squeal. Excessive belt squeal indicates excessive belt slip.
- If belt squeal is present, check the routing of the belt to make sure the belt is installed correctly on each pulley.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

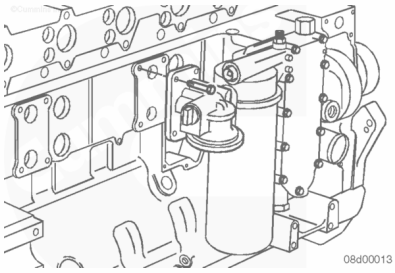
Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the engine coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the coolant filter. Refer to Procedure 008-006 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-006-tr.html)

Remove

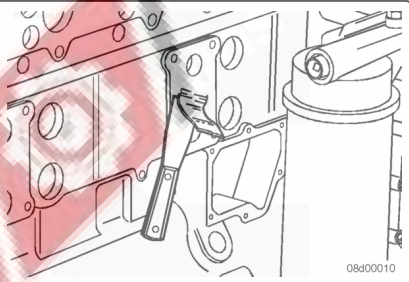
Loosen the four filter head capscrews.

Remove the filter head and gasket.



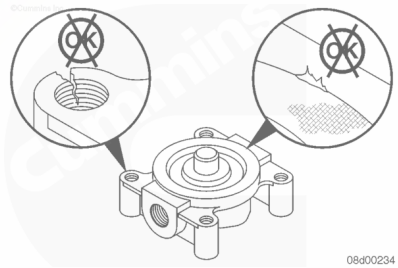
Clean and Inspect for Reuse

Clean the mating surfaces.



Inspect the filter head for cracks, burrs, or other damage.

Replace the filter head if it is damaged.



Install

Install a new gasket and the filter head.

Tighten the four capscrews.

Torque Value: 24 n•m [212 in-lb]

Recommended Cummins® Service Tools

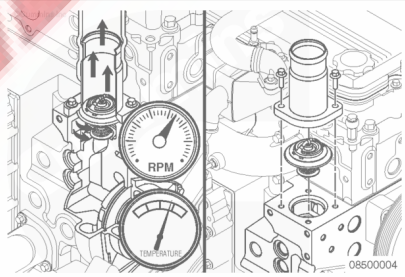
- Abrasive pad, Part Number 3823258, or equivalent

Additional Service Items

- Container suitable for coolant
- Thermometer

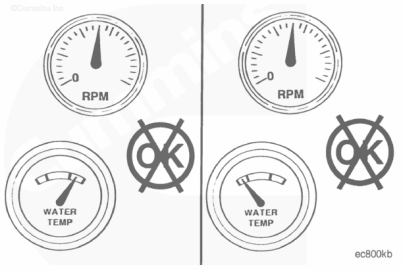
General Information

The thermostat controls the coolant temperature. When the coolant temperature is below operating temperature, coolant is bypassed to the inlet of the water pump. When the coolant temperature reaches the operating range, the thermostat opens, seals off the bypass, and forces coolant to flow to the radiator. The thermostat begins opening at 79°C [175°F] and 83°C or [182°F].



⚠ CAUTION ⚠

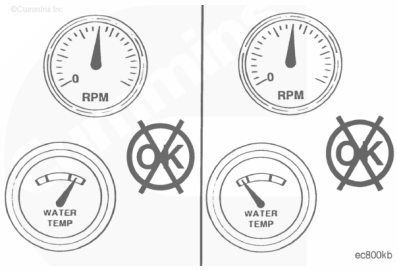
Never operate the engine without a thermostat. Without a thermostat, the path of least resistance for the coolant is through the bypass to the pump inlet. This will cause the engine to overheat.



An incorrect or malfunctioning thermostat can cause the engine to run too hot or too cold.

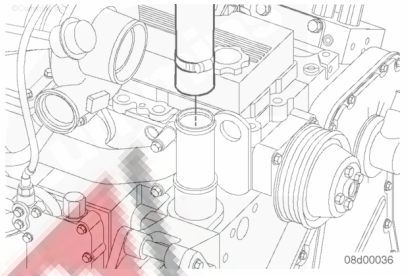
Leak Test

The engine thermostat and thermostat seal **must** operate properly in order for the engine to operate in the most efficient heat range. Overheating or overcooling will shorten engine life.



⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.



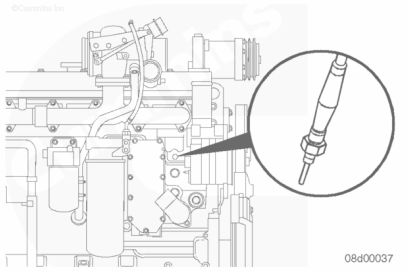
⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)

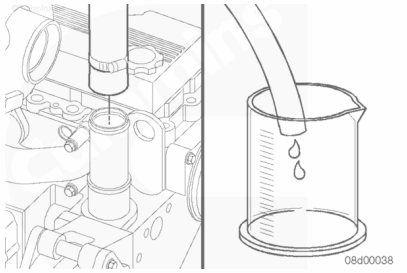
Remove the radiator hose from the water outlet connection.

Use an electronic service tool to monitor the coolant temperature, or install a thermocouple or temperature gauge, which is known to be accurate, in the cylinder block on the engine side of the thermostat.

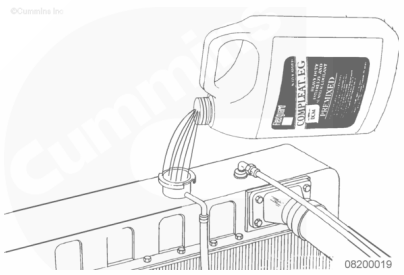


Install and tighten a hose clamp on the housing outlet.

Place the other end of the hose in a dry container.



Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)

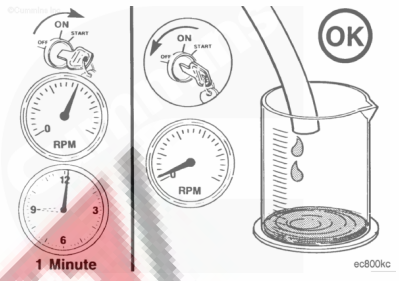


Note : The engine coolant temperature **must** be below the thermostat opening temperature to perform this test.

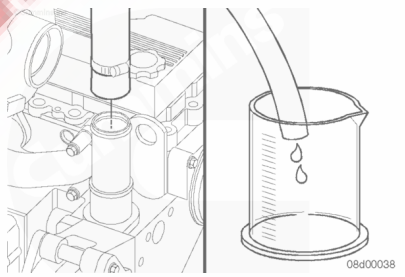
Operate the engine at rated speed for 1 minute.

Shut the engine OFF. Measure the amount of coolant collected in the container.

The amount of coolant collected **must not** be more than 100 cc [3.3 fl oz].

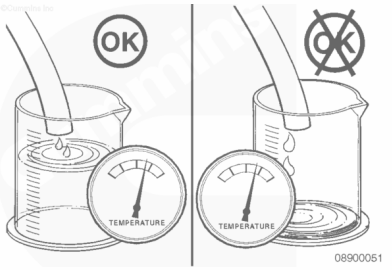


If more than 100 cc [3.3 fl oz] of coolant is collected, the thermostat is leaking and **must** be replaced.



Complete the following test in-chassis to determine thermostat opening temperature.

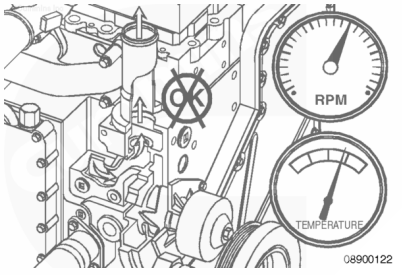
Start the engine. Monitor the coolant temperature with INSITE™ electronic service tool or a gauge. Keep the engine speed below 1500 rpm during the test.



Thermostat Initial Opening Temperature		
celsius		fahrenheit
79	MIN	175
83	MAX	182

Shut the engine OFF when the coolant starts to flow.

If coolant does **not** start flowing into the container during the initial opening temperature range, the thermostat **must** be replaced.



AYAROLU ISUZU DEALER SALES

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

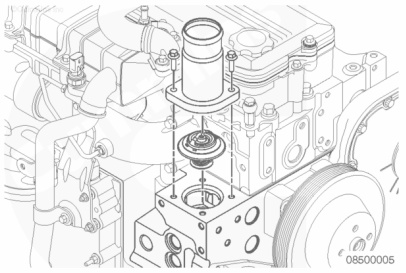
Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the radiator hose from the water outlet connection.

Remove

Remove the water outlet connection capscrews and water outlet connection.

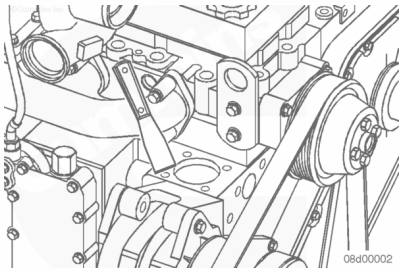
Remove the thermostat.



Clean and Inspect for Reuse

Note : Do **not** let any debris fall into the thermostat cavity when cleaning the surfaces.

Clean all of the mating surfaces with abrasive pad, Part Number 3823258, or equivalent, and clean cloth.



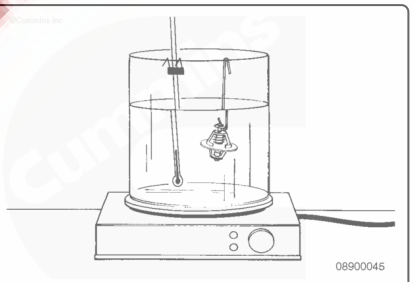
Inspect the thermostat for damage.

Inspect the thermostat gasket for damage. If the gasket is damaged, it **must** be replaced.

Note : Do **not** allow the thermostat or thermometer to touch the container.

Heat the water and check the thermostat as follows:

Suspend the thermostat and a 100°C [212°F] thermometer in a container of water.



The nominal operating temperature is stamped on the thermostat. The thermostat **must** meet the following criteria:

- The thermostat **must** begin to open within 1°C or 2°F of this nominal temperature.
- The thermostat **must** be fully open within 12°C or 22°F of this nominal temperature.

The fully open distance between the thermostat flange and housing is 10.16 mm [0.400 in].

Install

Note : A new gasket **must** be installed each time the thermostat or water outlet connection is removed.

Install the new thermostat into the cylinder block.

Install a new gasket over the thermostat and onto the block.

Install the water outlet connection and mounting capscrews.

Torque Value: 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

General Information

Use the following procedure for details on the type of exhaust gas recirculation (EGR) coolers (horizontal plate or vertical plate) in the General Information section. Refer to Procedure 011-019 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-019.html)

The engine covered in this manual has two possible coolant vent line connections.

In case of horizontal plate EGR coolers, the first is located on top of the EGR cooler and vents the cylinder head and EGR cooler.

The second is located on top of the turbocharger and vents the turbocharger.

In case of vertical plate EGR coolers, there are two vents on the top of the EGR cooler. The vent on the front end of the EGR cooler vents the cylinder head and EGR cooler.

In case of the vertical plate cooler, the vent on the rear end of the EGR cooler is used to vent the turbocharger.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

Note : Prior to removal, note the routing of the original equipment manufacturer (OEM) coolant vent line. The vent line **must** be routed "uphill" so that coolant is vented properly from the engine.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the engine coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Disconnect the coolant vent connection from the cylinder head.
- Disconnect the vehicle coolant vent lines from the coolant vent line connections on the EGR cooler and turbocharger actuator, if equipped. See equipment manufacturer service information.

Remove

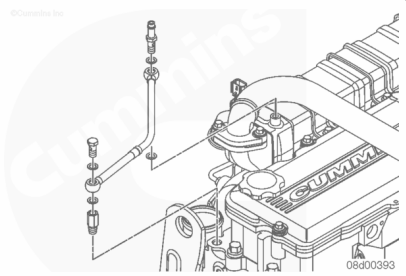
Horizontal Plate

Remove the coolant vent connection from the EGR cooler.

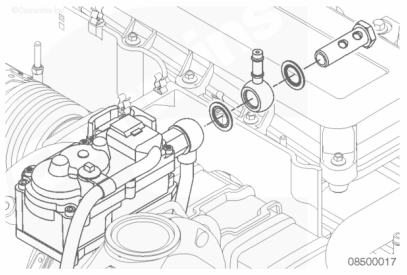
Remove the banjo bolt connecting the coolant vent line to the cylinder head fitting.

Remove the coolant vent line.

Remove the coolant vent line cylinder head fitting.



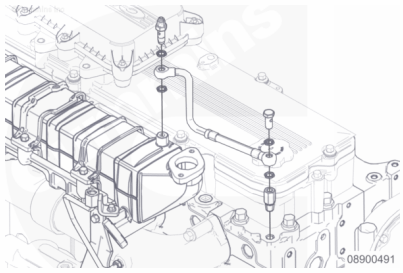
Remove the coolant vent fitting, if equipped, from the turbocharger actuator.



Vertical Plate

ANADOLU ISUZU AFTER SALES

Note : The illustrations shown for the vertical plate EGR cooler are generic. Based on the turbocharger mounting option the vent setup could possibly vary.



Remove the coolant vent connection from the EGR cooler.

Remove the banjo bolt connecting the coolant vent line to the cylinder head fitting.

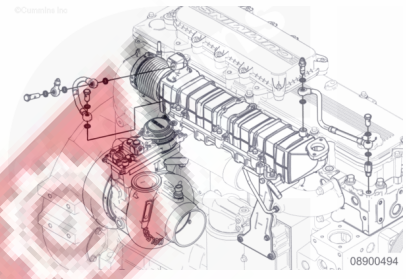
Remove the coolant vent line.

Remove the coolant vent line cylinder head fitting.

Remove the coolant vent connection from the EGR cooler.

Remove the coolant vent fitting from the turbocharger actuator.

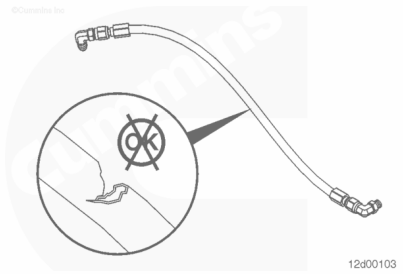
Remove the coolant vent line.



Clean and Inspect for Reuse

Inspect the coolant vent line and fittings for cracks and other damage.

Replace if any damage is found.



Install

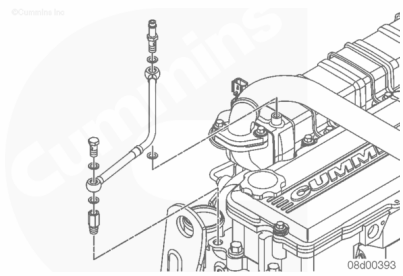
Horizontal Plate

Install the coolant vent line cylinder head fitting.

Torque Value: 18 n•m [160 in-lb]

Install the coolant vent line to the EGR cooler and cylinder head fitting using new sealing washers on both connections.

Tighten the coolant vent connection fitting on the EGR cooler.



ANADOLU ISUZU AFTER SALES

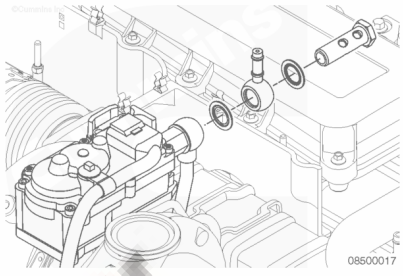
Torque Value: 12 n•m [106 in-lb]

Tighten the M10 banjo bolt at the cylinder head coolant vent line fitting.

Torque Value: 12 n•m [106 in-lb]

Install the coolant vent connection, if equipped, on the turbocharger actuator using a new sealing washer.

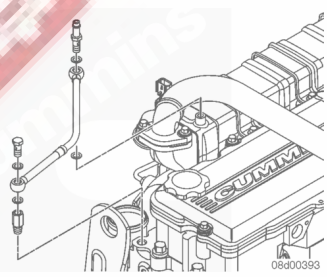
Torque Value:
M18 Banjo Bolt 12 n•m [106 ft-lb]



Vertical Plate

Install the coolant vent line cylinder head fitting.

Torque Value: 25 n•m [221 in-lb]



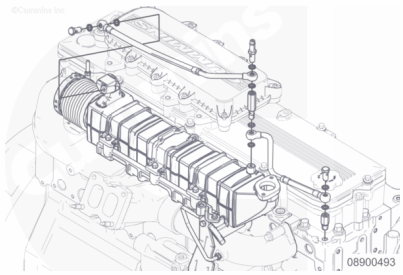
For LMRO turbocharger option:

Install the vent tube connecting the front vent of the EGR cooler and cylinder head vent using a coupling and banjo screw respectively. Use new sealing washers on both connections.

Torque Value: 15 n•m [133 in-lb]

Install the vent line connecting the front and rear vent of the EGR cooler. Use hose bead or quick-connect fitting and banjo screw respectively. Use new sealing washers on both connections.

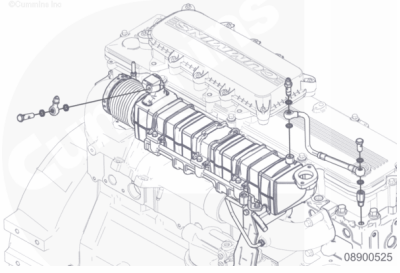
Torque Value: 15 n•m [133 in-lb]



For MMRO turbocharger option:

Install the vent tube connecting the front vent of the EGR cooler and cylinder head vent. Use a hose bead or quick-connect fitting and banjo screw respectively. Use new sealing washers on both connections.

Torque Value: 15 n•m [133 in-lb]

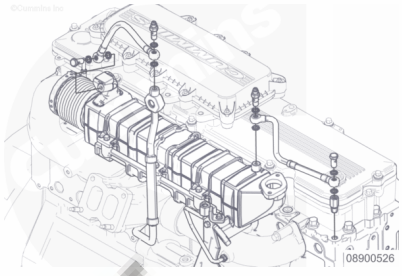


ANADOLU ISUZU
PARTS SALES

Install a banjo fitting on the rear end vent of the EGR cooler. Use new sealing washer. Vent the banjo fitting to the OEM top tank

Torque Value: 15 n•m [133 in-lb]

For HMRO turbocharger option:



Install the vent tube connecting the front vent of the EGR cooler and cylinder head vent. Use a hose bead or quick-connect fitting and banjo screw respectively. Use new sealing washers on both connections.

Torque Value: 15 n•m [133 in-lb]

Install the rear vent tube on the turbocharger vent and EGR cooler rear vent. Use new sealing washers on both connections.

Install the vent tube on the EGR cooler rear vent fitting. Use a screw banjo connector.

Torque Value: 15 n•m [133 in-lb]

Install the vent tube on the turbocharger coolant vent fitting. Use a hose bead or quick-connect.

Torque Value: 15 n•m [133 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the vehicle coolant vent line to the coolant vent line connections on the EGR cooler and turbocharger actuator. See equipment manufacturer service information.
- Connect the coolant vent connection onto the cylinder head.

Note : The vent line **must** be routed "uphill" so coolant is vented properly from the engine.

- Connect the vehicle coolant vent line to the coolant vent line connections on the EGR cooler. See equipment manufacturer service information.
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)

ANADOLU ISUZU AFTER SALES

- No Cummins® service tools required.

Additional Service Items

- Container suitable for coolant
- Sodium carbonate or Restore™

General Information

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

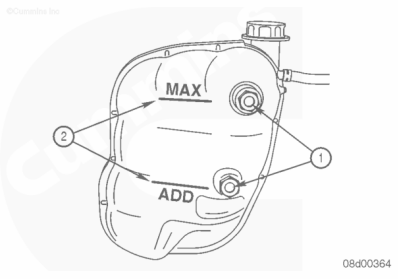
Note : Never use a sealing additive to stop leaks in the coolant system. This can result in coolant system plugging and inadequate coolant flow, causing the engine to overheat.

The engine coolant level **must** be checked daily.

Note : In order for proper engine operation coolant system pressure to be reached, the pressure cap **must** be installed prior to starting and warming up the engine. If the pressure cap is installed or removed while the engine is hot, the cooling system will **not** reach or maintain the proper operating pressure.

⚠ CAUTION ⚠

Do not add cold coolant to a hot engine. Engine castings can be damaged. Allow the engine to cool below 50°C [120°F] before adding coolant.



Note : Use the following procedure to inspect the engine coolant level sensor. Refer to Procedure 019-017 in Section 19.

(/qs3/pubsys2/xml/en/procedures/425/425-019-017.html)

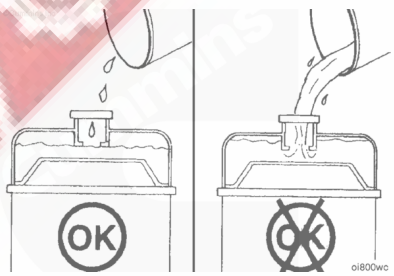
On applications that use a coolant recovery system, check to make sure the coolant is at the appropriate level on the coolant recovery tank for the engine temperature.

Many coolant recovery/expansion tanks, also called "top tanks", have sight glasses (1) or are made of a clear material (**not** shown) to aid in checking the coolant level (2) without removing the radiator cap.

It is important to understand the impact of temperature on the expansion of the coolant. Most "top tanks" do **not** have a provision for a "FULL HOT" coolant level. Filling the "top tank" while hot will result in a low operating level once the system has cooled.

Fill the cooling system with coolant to the bottom of the fill neck in the radiator fill or recovery/expansion tank.

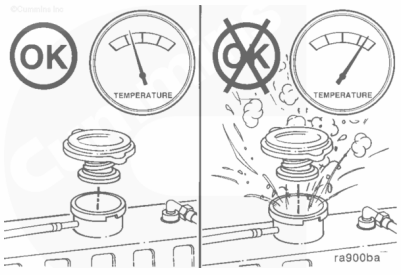
Note : Some radiators have two fill necks, both of which **must** be filled when the cooling system is drained.



Drain

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.



Position the vehicle or equipment on a level surface.

Isolate the engine from the vehicle cooling system by closing coolant flow valves to the equipment heating systems before initiating repair. This will prevent the heater circuit from draining, minimizing the chance for air pockets to be present during the fill process. See equipment manufacturer service information for system isolation valve locations.

This air can be very difficult to purge in some applications that have several feet of plumbing and multiple heater cores.

ANADOLU ISUZU PARTS SALES

Note : If the coolant is being changed, or if the cooling system is being flushed, it is desirable to leave the coolant flow valves to the equipment heating systems open, in order to completely drain the system.

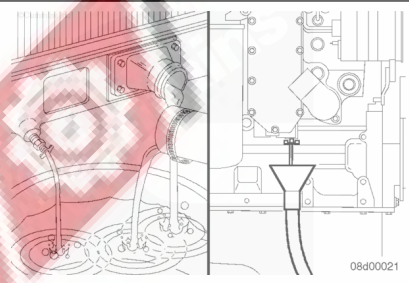
Use equipment manufacturer service information for any special coolant drain and fill requirements.

These special instructions can also be located near the cooling system access or fill door on the vehicle.

Remove all cooling system fill caps to allow the coolant to drain completely.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.



Note : If the coolant will be reused, use a clean container in which to drain the coolant. Also, cover the container to prevent coolant contamination after draining.

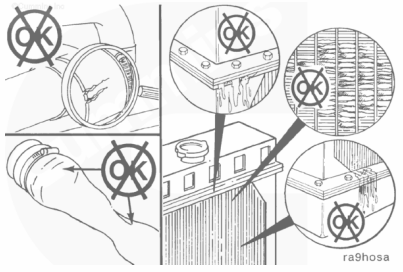
Drain the cooling system by opening the drain valve on the radiator and by opening the drain valve on the bottom of the engine oil cooler housing. A drain pan with a capacity of 57 liters [15 gal] is adequate in most applications.

After the cooling system is completely drained, close the drain valves. See equipment manufacturer service information for complete cooling system drain information.

Check for damaged hoses and loose or damaged hose clamps. Replace as required.

Check the radiator for leaks, damage, and buildup of dirt.

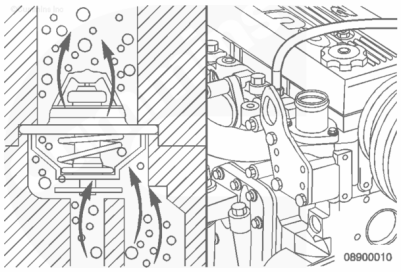
Clean and replace as required.



Flush

⚠ CAUTION ⚠

The system must be filled properly to prevent air locks or serious engine damage can result. During filling, air must be vented from the engine coolant passages. Wait 2 to 3 minutes to allow air to be vented; then add mixture to bring the level to the top.



Make sure air is vented during the filling process:

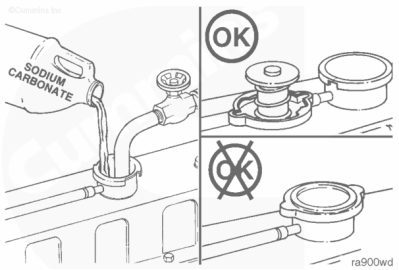
- Some thermostats have check balls that allow air to vent through the thermostat when the thermostat is closed.
- An air vent port connection, which connects to the top tank/coolant recovery tank of the cooling system, is located next to the water outlet.

This provides adequate venting for a maximum fill rate of 19 liters [5 gal] per minute.

Note : An alternate to using sodium carbonate, as outlined in this procedure, is to use Restore™.

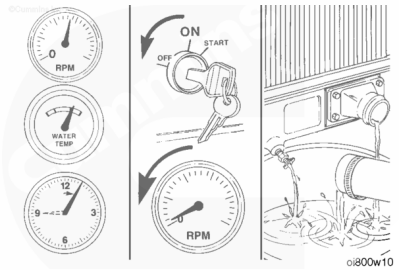
Restore™ is a heavy-duty cooling system cleaner that removes corrosion products, silica gel, and other deposits. The performance of Restore™ is dependent on time, temperature, and concentration levels. An extremely scaled or flow-restricted system, for example, can require higher concentrations of cleaners, higher temperatures, longer cleaning time, or the use of Restore Plus™. Up to twice the recommended concentration levels of Restore™ can be used safely. Restore Plus™ **must** be used **only** at its recommended concentration level. Extremely scaled or fouled systems can require more than one cleaning.

Note : Do **not** install the radiator cap. The engine is to be operated without the cap for this process.



⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.



⚠ WARNING ⚠

Do not stand near surge tank or radiator while operating the engine with the pressure cap off. If the equipment is equipped with a fill door on the side of the surge tank, keep it closed due to coolant expansion.

⚠ CAUTION ⚠

Do not operate the engine with the pressure cap off at temperatures above 93°C [200°F]. This can result in potential engine damage by cavitation of the water pump and localized boiling.

⚠ CAUTION ⚠

Before topping off coolant, allow the system temperature to cool to ambient. This will make sure an adequate amount of coolant is available to the water pump during all periods of operation.

⚠ CAUTION ⚠

Do not relieve the system pressure while hot in order to "top off" immediately before returning the vehicle to service. The system will not be able to generate the pressure through the expansion of the coolant necessary for operation. This can result in potential engine damage by cavitation of the water pump and localized boiling.

Fill the cooling system with a mixture of sodium carbonate and water (or a commercially available equivalent) to the capacity or level stated in the equipment manufacturer service information.

Note : Adequate venting is provided for a maximum fill rate of 19 liters [5 gal] per minute.

Unless indicated otherwise by the original equipment manufacturer (OEM) instructions, it is critical all shutoff valves be returned to their open positions once the system has been refilled and the deaeration process is about to begin. This will help to make sure as much air as possible will be purged from the cooling system. See equipment manufacturer service information for valve locations.

ANADOLU ISUZU

Wait 2 to 3 minutes without starting the engine to allow the system to naturally purge entrained air and the coolant level to stabilize.

Add plain water to bring the level back to FULL.

Turn all cab heater switches to HIGH in order to allow maximum coolant flow through the heater core(s). The blower **must** be turned ON.

With the cooling system fill cap removed:

- Operate the engine at LOW idle for 2 minutes.
- Turn the engine OFF. Add plain water to bring the level back to FULL.

With the cooling system fill cap removed:

- Start the engine.

Note : After starting a cold engine, increase the engine speed (rpm) slowly to provide adequate lubrication to the bearings and to allow the oil pressure to stabilize.

Operate the engine at HIGH idle until the thermostat opens.

Allow the engine to return to LOW idle 2 minutes before shutting it down. This allows adequate cool down of pistons, cylinders, bearings, and turbocharger components.

Turn engine OFF and check the coolant level according to the equipment manufacturer service information recommendations. Add coolant, if necessary, to bring it back to the FULL level.

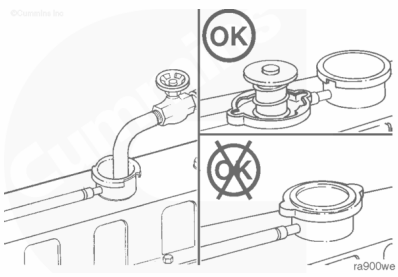
Install the cooling system fill cap.

Operate the engine for 1 to 1½ hours with the coolant temperature above 80°C [176°F].

Turn engine OFF. Allow the coolant temperature to drop to 50° C [122° F] before draining the cooling system.

Drain the cooling system.

Note : Do **not** install the radiator cap.



Fill the cooling system with good quality water to the capacity or level stated in equipment manufacturer service information.

Unless indicated otherwise by OEM instructions, it is critical all shutoff valves be returned to their open positions once the system has been refilled and the deaeration process is about

to begin. This will help to make sure as much air as possible will be purged from the cooling system. See equipment manufacturer service information for valve locations.

Wait 2 to 3 minutes, without starting the engine, to allow the system to naturally purge entrained air and the coolant level to stabilize.

Add plain water to bring the level back to FULL.

Turn all cab heater switches to HIGH in order to allow maximum coolant flow through the heater core(s). The blower **must** be turned ON.

With the cooling system fill cap removed:

- Operate the engine at LOW idle for 2 minutes.
- Turn off the engine. Add plain water to bring the level back to FULL.

With the cooling system fill cap removed:

- Start the engine.
- Operate the engine at HIGH idle until the thermostat opens.

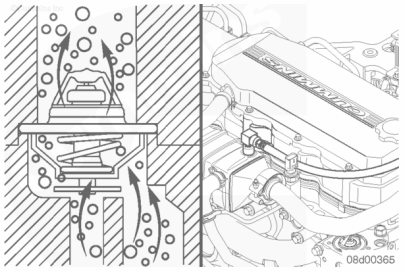
Note : After starting a cold engine, increase the engine speed (rpm) slowly to provide adequate lubrication to the bearings and to allow the oil pressure to stabilize.

Allow the engine to return to LOW idle 2 minutes before shutting it down. This allows adequate cool down of pistons, cylinders, bearings, and turbocharger components.

Fill

⚠ CAUTION ⚠

The system must be filled properly to prevent air locks or serious engine damage can result. During filling, air must be vented from the engine coolant passages. Wait 2 to 3 minutes to allow air to be vented; then add the mixture to bring the level to the top.



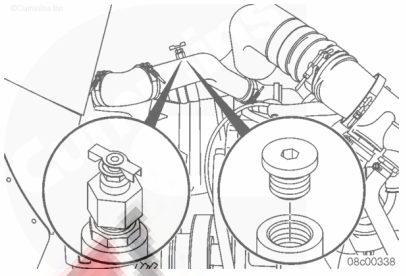
Make sure air is vented during the fill process:

- Some thermostats have check balls that allow air to vent through the thermostat when the thermostat is closed.

- An air vent port connection, which connects to the top tank/coolant recovery tank of the cooling system, is located next to the water outlet.

The system has a design maximum fill rate of up to 19 liters [5 gal] per minute.

Note : Some applications can be equipped with a manual bleed valve which is to be opened to make sure of a proper fill. The upper radiator pipe is a common location for bleed valves. The illustration is for reference **only**.



If applicable, open the manual bleed valve before filling the cooling system.

Once properly filled, make sure to close the manual bleed valve.

⚠ CAUTION ⚠

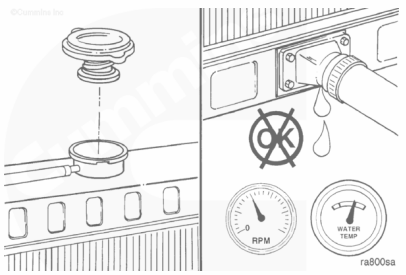
Never use water alone for coolant. Damage from corrosion can be the result of using water alone for coolant.

Use the following service bulletin for engine coolant specifications. Refer to Service Bulletin, Cummins® Coolant Requirements and Maintenance, Bulletin 3666132. (/qs3/pubsys2/xml/en/bulletin/3666132.html)

If the coolant is reused, it should be inspected for signs of contamination, concentration levels, and SCA/DCA additives.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.



⚠ WARNING ⚠

Do not stand near surge tank or radiator while operating the engine with the pressure cap off. If the equipment is equipped with a fill door on the side of the surge tank, keep it closed due to coolant expansion.

⚠ CAUTION ⚠

Do not operate the engine with the pressure cap off at temperatures above 93°C [200°F]. This can result in potential engine damage by cavitation of the water pump and localized boiling.

⚠ CAUTION ⚠

Topping off the system while hot is not recommended when using the fill door on transit bus applications equipped with surge tanks. Bringing the level to the bottom of the door while the system is hot will not provide adequate volume of coolant for lower operating temperatures. This can result in cavitation of the water pump and greatly increase the potential for engine damage.

⚠ CAUTION ⚠

Before topping off coolant, allow the system temperature to cool to ambient. This will make sure an adequate amount of coolant is available to the water pump during all periods of operation.

⚠ CAUTION ⚠

Engine and component damage may result if adequate cool down time is not given after the cooling system pressure has been relieved in order to "top off". System pressure is ONLY generated with temperature rise of coolant. Closing the cooling system while hot will not allow pressure to build.

Remove the cooling system fill cap.

Fill the cooling system to the capacity or level stated in the equipment manufacturer service information, using a mixture of 50 percent water and 50 percent ethylene glycol or propylene glycol antifreeze.

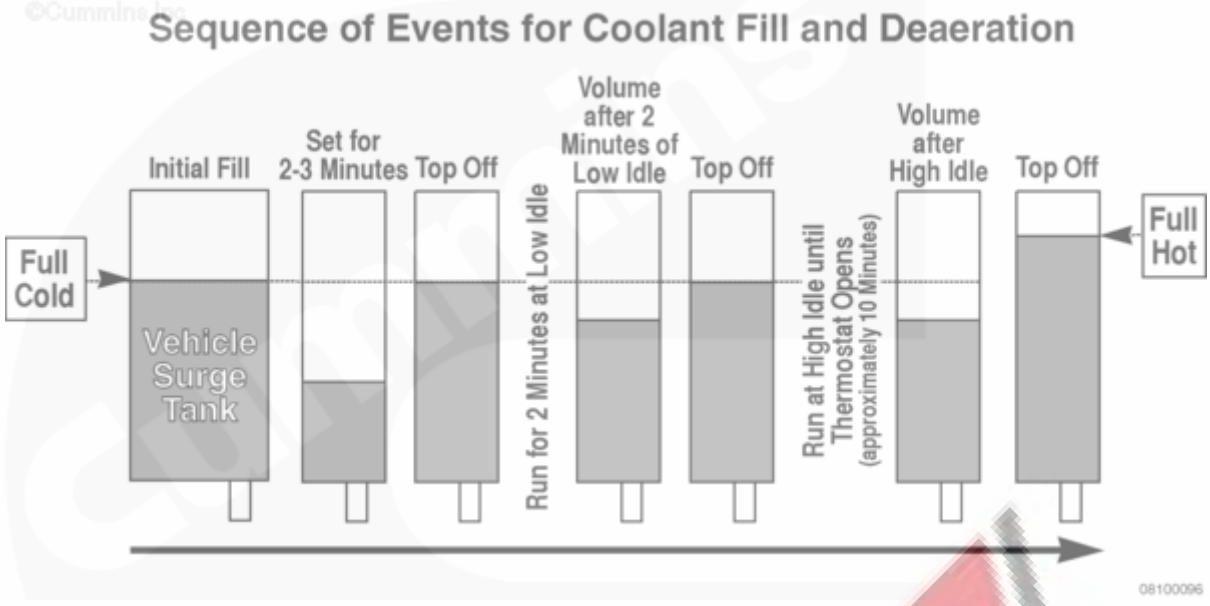


Figure 1: Sequence of Events for Coolant Fill and Deaeration.

Note : If all coolant drained from the system was collected, the same volume or more **must** go back into the system. If any drained coolant remains after filling, this is an indication of an air pocket which **must** be purged before returning the vehicle to service.

Unless indicated otherwise by OEM instructions, it is critical all shutoff valves be returned to their open positions once the system has been refilled and the deaeration process is about to begin. This will help to make sure as much air as possible will be purged from the heating circuit. See equipment manufacturer service information for valve locations.

Wait 2 to 3 minutes, without starting the engine, to allow the system to naturally purge entrained air and coolant level to stabilize.

Add a 50/50 mixture to bring the coolant level back to the FULL cold level.

Turn all cab heater switches to HIGH in order to allow maximum coolant flow through heater core(s). The blower **must** be turned ON.

With the cooling system fill cap removed:

- Operate the engine at LOW idle for 2 minutes.
- Turn off the engine. Add coolant to bring the level back to the FULL cold level, using 50/50 mixture.

With the radiator pressure cap off:

Note : After starting a cold engine, increase the engine speed (rpm) slowly to provide adequate lubrication to the bearings and to allow the oil pressure to stabilize.

- Start the engine.
- Operate the engine at HIGH idle until the thermostats open.

Allow the engine to idle 2 minutes before shutting it down. This allows adequate cool down of pistons, cylinders, bearings, and turbocharger components.

- Turn the engine OFF.

- Top off coolant to the FULL hot level.
- It is the responsibility of the customer to check the cold coolant level and top off if necessary.

Note : Certain applications can require an additional 10 minutes of operation time at HIGH idle for complete deaeration. For best results, see the OEM coolant fill procedure for specific instructions.

Allow the engine to cool to 50°C [122°F] then install the pressure cap. Operate the engine until it reaches a temperature of 80°C [176°F]. Check for coolant leaks.

See Figure 1 for a graphic explanation of the fill process.

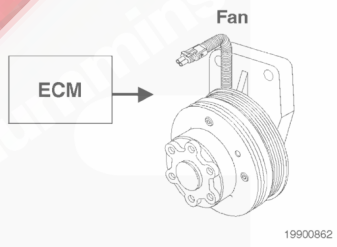
General Information

⚠ WARNING ⚠

The cooling fan will engage when the engine is started. To prevent serious personal injury, keep your hands clear of the fan's path when starting the engine and during engine operation.



All fan clutches can be controlled by the engine control module (ECM). The ECM monitors coolant temperature and intake manifold temperature to determine when to engage the cooling fan. Some applications have additional sensors monitored by the ECM for fan control (for example, air conditioner pressure and transmission temperature). The original equipment manufacturer (OEM) can also install a manual override switch to engage the clutch manually at the operator's command.

The ECM is capable of using a 0 VDC, 12 VDC, or 24 VDC signal to engage the fan clutch. The exact enable logic can be selected in the Features and Parameters section of INSITE™ electronic service tool.

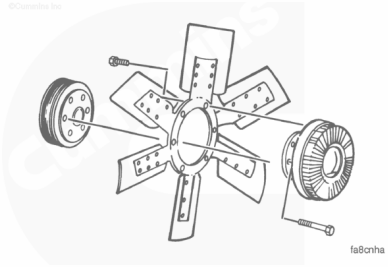
See the equipment manufacturer's service manual for fan clutch troubleshooting and repair information.

These are various fan clutch types such as:

- Air engaged
- Air disengaged
- Electric

- Viscous
- ON-OFF.

See equipment manufacturer service information for all service related information.



Preparatory Steps

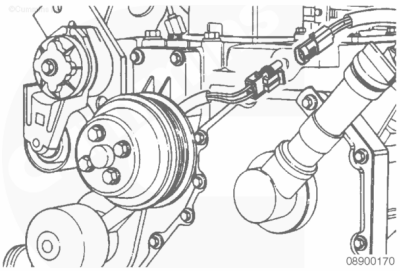
⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the cooling fan and spacers. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)

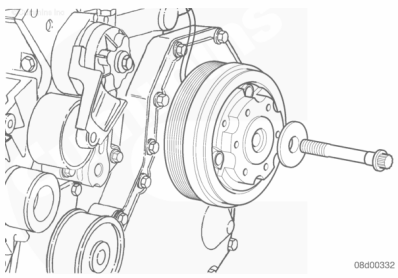
Remove

Disconnect the fan clutch connector on the base harness from the fan clutch. See equipment manufacturer service information.

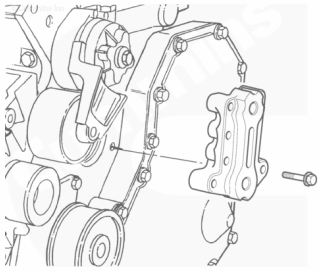


Note : As the electric fan clutch mounting fastener is loosened, make sure to support the clutch.

Remove the electric fan clutch mounting capscrew, washer, and electric fan clutch. See equipment manufacturer service information.



Note : Prior to removing the electric fan clutch support bracket, note the mounting location and orientation of the bracket. The mounting bracket can be installed in different orientations for different fan drive arrangements.



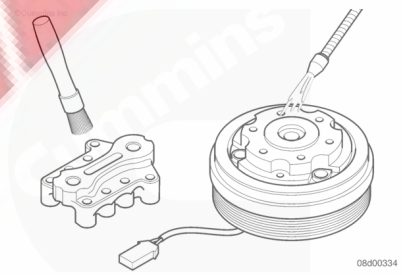
Note : Note the location of the P-clip for the electric fan clutch wiring harness pigtail.

Remove the electric fan clutch support bracket and mounting capscrews. See equipment manufacturer service information.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

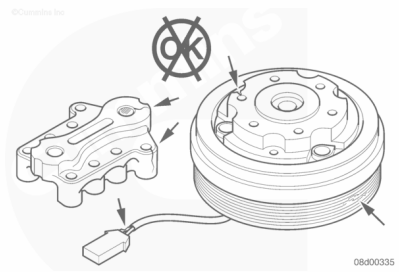


⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

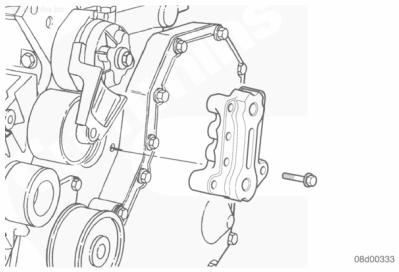
Clean the fan clutch and bracket. Use solvent. Dry with compressed air.

Inspect the fan clutch and bracket for damage. See equipment manufacturer service information.



Install

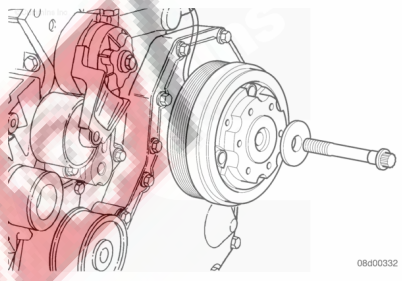
Note : Make sure to install the electric fan clutch mounting bracket in the same orientation and location as removed. The mounting bracket can be installed in different orientations for different fan drive arrangements.



Install the electric fan clutch support bracket, wiring harness pigtail P-clip, and mounting capscrews. See equipment manufacturer service information.

⚠ CAUTION ⚠

Correct loading of the fan clutch joint is necessary for proper cooling system operation. An over-torqued or under-torqued capscrew, caused by the use of air powered tools, an out-of-calibration wrench, or other methods could lead to significant damage to the front end accessory drive.

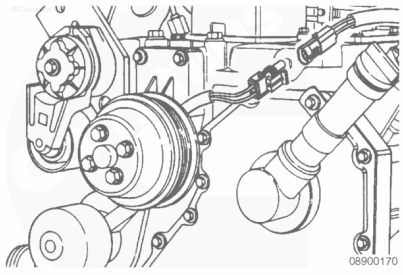


Install the electric fan clutch, washer, and mounting capscrew. See equipment manufacturer service information.

Note : Make sure wires are **not** being pulled at the fan clutch.

Tighten the fan clutch mounting capscrew. See equipment manufacturer service information.

Connect the fan clutch connector on the base harness to the fan clutch. See equipment manufacturer service information.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Install the cooling fan and spacers. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate engine. Check for proper operation.

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

General Information

Several different fan hub mounting locations and fan hub options are available. The illustrations in this procedure are generic and may **not** represent the hardware on all engines.

Preparatory Steps

⚠ WARNING ⚠

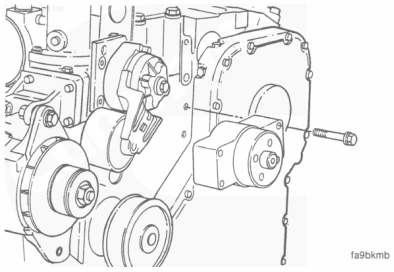
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- If necessary, remove the cooling fan. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Remove the fan pulley and spacer. Refer to Procedure 008-039 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-039.html)

Remove

Remove the fan hub mounting capscrews.

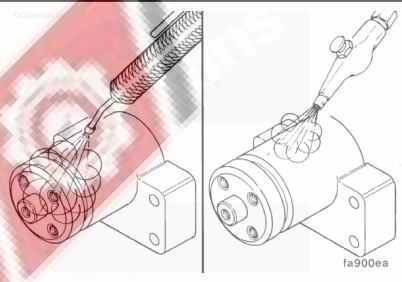
Remove the fan hub.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

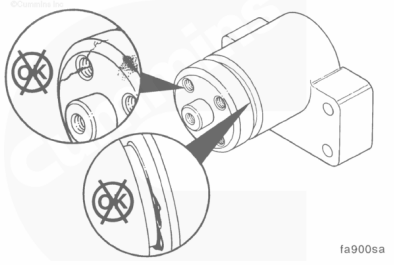
Clean the exterior of the fan hub. Use steam. Dry with compressed air.

Inspect the fan hub for an indication of oil seal leakage.

Inspect the fan hub for cracks or damage.

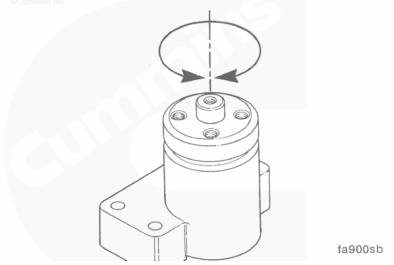
Inspect the fan hub chamfer and pulley mating surface for damage.

Replace the fan hub if damage is found.



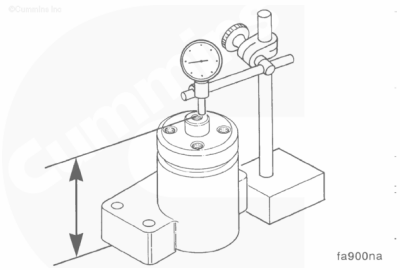
Turn the fan hub by hand to check for freedom of rotation.

The fan hub **must** spin freely without any wobble or excessive end clearance.



Inspect the fan hub bearing for wear.

The bearing **must** have a minimal amount of side-to-side or end clearnce movement.



Replace the fan hub if there is more than 0.15 mm [0.006 in] of end clearance in the fan hub.

Fan Hub End Clearance		
mm		in
0.15	MAX	0.006

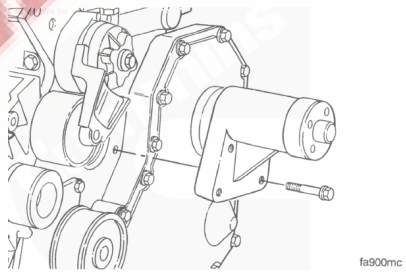
Note : Some fan hub assemblies can be rebuilt with new bearings and related components. Check for part availability before disassembling the fan hub.

Install

Install the fan hub and capscrews.

Tighten the capscrews.

Torque Value: 24 n•m [212 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fan pulley and spacer. Refer to Procedure 008-039 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-039.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- If removed, install the cooling fan. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Last Modified: 04-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

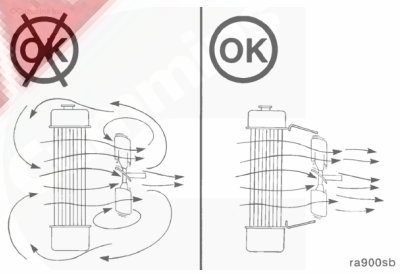
- No additional service items required.

General Information

The radiator or fan shroud is used to direct all air flow across the radiator fins rather than around the edges of the radiator.

An incorrect fan shroud or obstructions can reduce air flow and cause the engine to run hot.

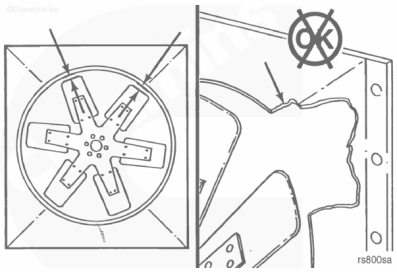
Note : Check to make sure air is **not** recirculating. Check for missing baffles.



Initial Check

⚠ CAUTION ⚠

The fan shroud must be installed correctly, be in good condition, and the shroud-to-fan clearance must be within manufacturer specifications to allow proper air flow through the radiator to provide adequate engine cooling.



Inspect the fan shroud for proper fan clearance, cracks, air leaks, and damage. Replace, if necessary. See equipment manufacturer service information for instructions.

Cummins Inc. recommends fan clearance be between 5.08 to 10.16 cm [2 to 4 in] from the radiator core. See equipment manufacturer service information for alternative positions.

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

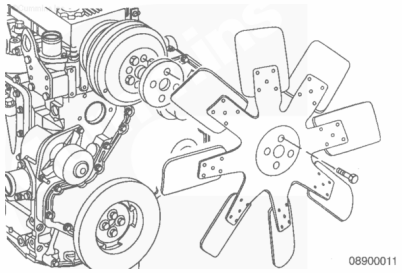
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

Note : Prior to removing the drive belt, loosen the fan pulley and cooling fan mounting capscrews, if equipped.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the fan drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)

Remove

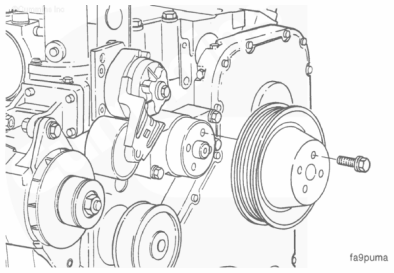
Note : Some applications do **not** have a cooling fan or the cooling fan is located elsewhere on the application.



If equipped, remove the cooling fan. See equipment manufacturer service information for instructions.

For engines equipped with an engine driven cooling fan, the fan holds the fan pulley and spacer in place. Remove the fan pulley and spacer.

If the engine is **not** equipped with an engine driven cooling fan, remove the fan pulley mounting capscrews and fan pulley.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

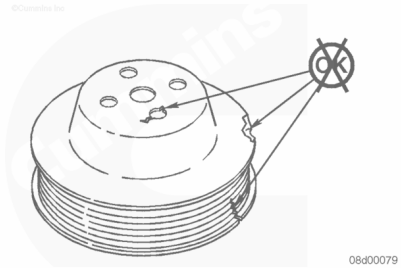
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the fan pulley and spacer. Use solvent. Dry with compressed air.

Inspect the fan pulley for cracks near bolt holes and for damage at the drive belt contact surface.

If damage is found on the fan pulley, the fan hub **must** also be inspected. Refer to Procedure 008-036 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-036.html)

Replace the pulley if any damage is found.

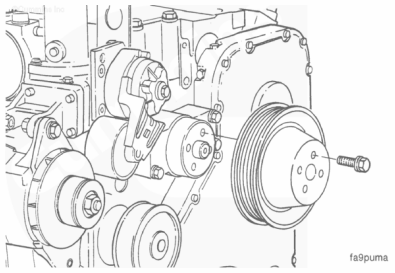


Install

If the engine is **not** equipped with an engine driven cooling fan, install the fan pulley mounting capscrews and fan pulley.

Tighten the mounting capscrews finger-tight.

Tighten the mounting capscrews to the final torque value after the drive belt is installed, using the tension of the drive belt to keep the fan pulley from rotating.

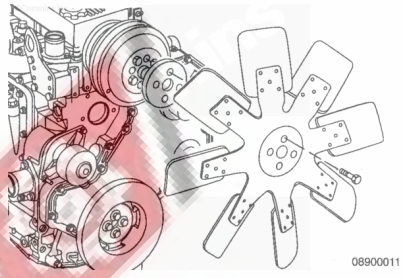


Torque Value:
M6 10 n•m [89 in-lb]

Torque Value:
M10 43 n•m [32 ft-lb]

Torque Value:
M12 77 n•m [57 ft-lb]

For engines equipped with an engine driven cooling fan, the fan holds the fan pulley and spacer in place. Install the fan pulley and spacer.



If removed, install the cooling fan. See equipment manufacturer service information for instructions.

Tighten the mounting capscrews finger-tight.

Tighten the mounting capscrews to the final torque value after the drive belt is installed, using the tension of the drive belt to keep the fan pulley from rotating.

Do **not** hold the fan blades to keep the fan pulley or cooling fan from rotating.

Torque Value:
M6 10 n•m [89 in-lb]

Torque Value:
M10 43 n•m [32 ft-lb]

Torque Value:
M12 77 n•m [57 ft-lb]

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

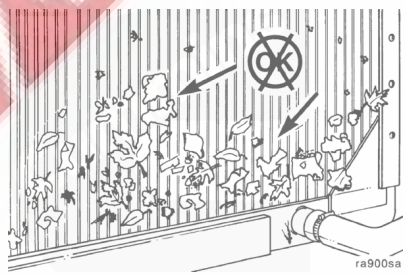
- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

General Information

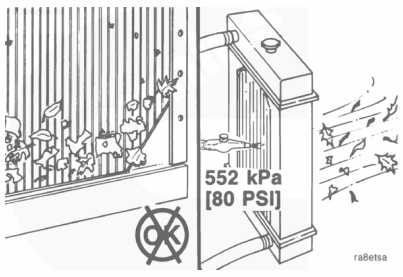
Air forced through the fins of the radiator by a fan cools the coolant pumped through the radiator. Environmental debris (such as paper, straw, lint, and dust) can obstruct the fins and stop the flow of air that will reduce the cooling effect of the radiator.



Initial Check

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



Inspect for plugged radiator fins.

Use compressed air to blow out the dirt and debris.

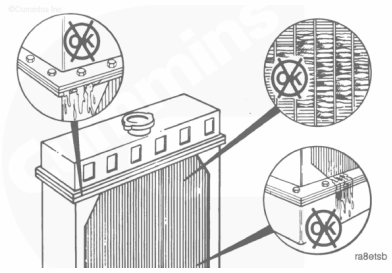
Measurements		
	kpa	psi
Air Pressure:	552	80

Inspect for bent or broken fins.

ANADOLU ISUZU PARTS SALES

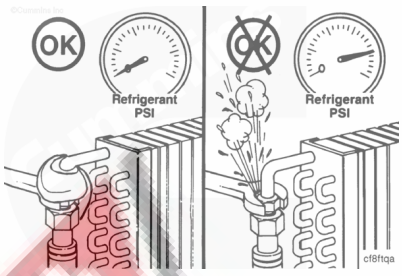
Inspect for radiator core and gasket leaks.

If the radiator **must** be replaced, see the equipment manufacturer service information.



⚠ WARNING ⚠

If a liquid refrigerant system (air conditioning) is used, wear eye and face protection, and wrap a cloth around the fittings before removing. Liquid refrigerant can cause serious eye and skin injuries.



⚠ WARNING ⚠

To protect the environment, liquid refrigerant systems must be properly emptied and filled using equipment that prevents the release of refrigerant gas into the atmosphere. Federal law requires capturing and recycling the refrigerant.

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

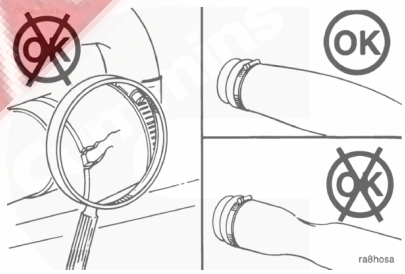
Additional Service Items

- No additional service items required.

Inspect for Reuse

Inspect all hoses for cracks, cuts, or collapsing.

Note : The silicone engine coolant hose will exhibit swelling due to the elasticity of the hose.



ANADOLU ISUZU
AFTER SALES

Last Modified: 04-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

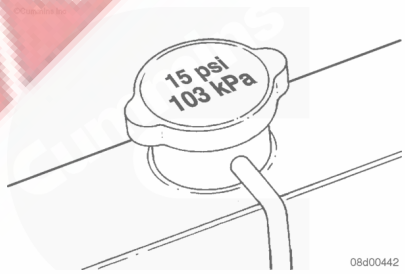
- No Cummins® Service Tools required.

Additional Service Items

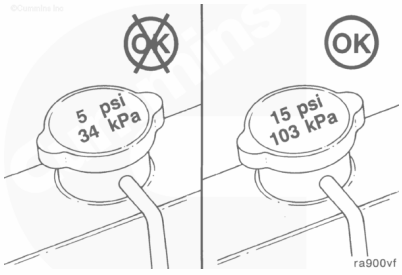
- Air regulator

General Information

The cooling system is designed to use a pressure cap to prevent boiling of the coolant.

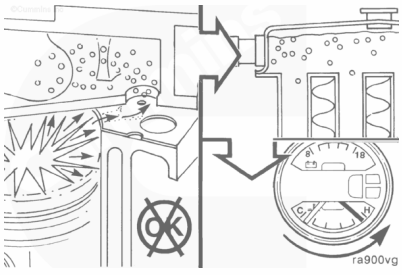


An incorrect or malfunctioning cap can result in the loss of coolant and the engine running hot.



Air in the coolant can result in loss of coolant from the overflow when the aerated coolant is hot. The heated air expands, increasing the pressure in the system, causing the cap to open.

Similarly, coolant can be displaced through the overflow if the head gasket leaks compression gases into the cooling system.

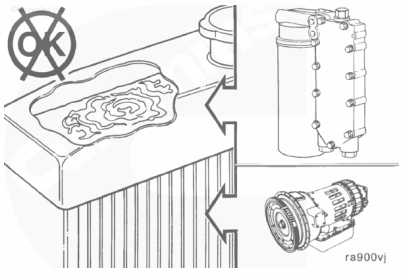


The operating pressure of the cooling system and lubricating system can result in the mixing of the fluids if there is a leak between the systems, such as the head gasket or oil cooler.

ANADOLU ISUZU AFTER SALES

Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)

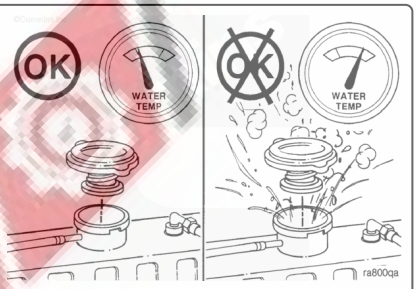
Note : Transmission fluid can also leak into the coolant through radiator bottom tank transmission oil coolers.



Inspect for Reuse

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature s below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.



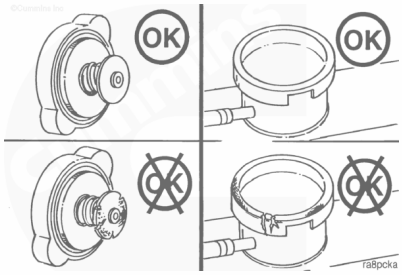
Remove the radiator pressure cap.

Make sure the correct radiator cap is being used. See equipment manufacturer service information for inspection criteria.

Inspect the rubber seal of the pressure cap for damage.

Inspect the radiator fill neck for cracks or other damage.

See equipment manufacturer service information for instructions if the fill neck is damaged.



Test

It is recommended to test the radiator pressure cap sealing capability while installed on the vehicle.

See equipment manufacturer service information for this check, or see the steps below.

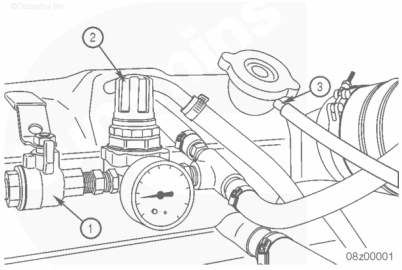
For those installations where this is **not** possible, it is acceptable to test the cap off-vehicle using a radiator pressure cap test kit.

ANADOLU ISUZU PARTS SALES

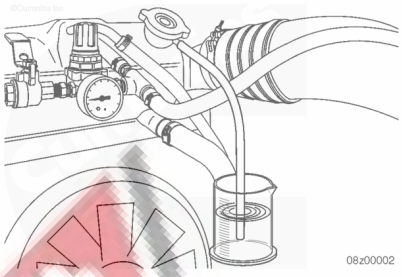
Connect the air line to a vent line on the surge tank.

Install an air regulator (2) between the ball valve (1) or the air line and the surge tank connection.

Attach a hose to the radiator overflow connection (3).

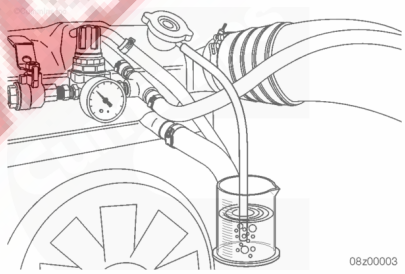


Place the free end of the hose below the water level in a container of water.



⚠ CAUTION ⚠

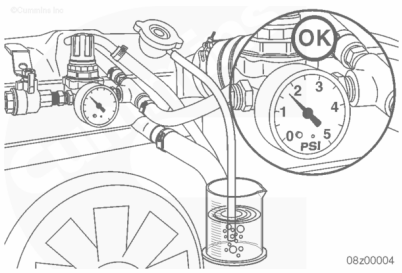
Do not apply more than 140 kPa [20 psi] air pressure to the cooling system. The water pump seal can be damaged.



Pressurize the cooling system slowly to the value printed on the radiator pressure cap or until bubbles can be seen in the overflow bottle.

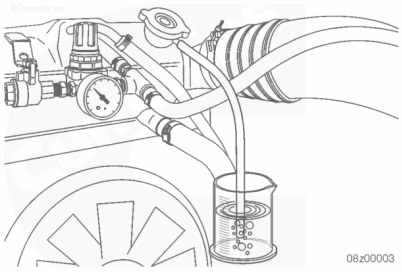
Bubbles should start to form at a pressure within 14 kPa [2 psi] of the value printed on the radiator pressure cap, or it **must** be replaced.

Note : An incorrect or malfunctioning radiator pressure cap can result in the loss of coolant and the engine operating above engine temperature guidelines.



⚠ CAUTION ⚠

Do not apply more than 140 kPa [20 psi] air pressure to the cooling system. The water pump seal can be damaged.

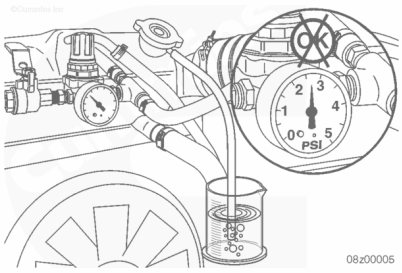


Slowly reduce the cooling system pressure.

BAHADLI ISUZU PARTS

If bubbles continue to form at a pressure within 14 kPa [2 psi] of the value printed on the radiator pressure cap, it **must** be replaced.

Note : An incorrect or malfunctioning radiator pressure cap can result in the loss of coolant and the engine operating above engine temperature guidelines.



For those installations where it is **not** possible to test the radiator pressure cap on-vehicle, use a radiator pressure cap test kit.

See equipment manufacturer service information for guidelines and instructions for this check, or see the steps below.

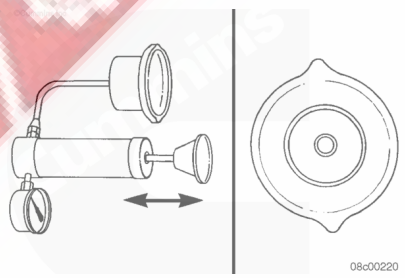
Pressure-test the radiator pressure cap.

The radiator pressure cap **must** seal within 14 kPa [2 psi] of the value printed on the cap, or it **must** be replaced.

Use the following procedure for cooling system specifications.

Refer to Procedure 018-018 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-018.html)

Note : An incorrect or malfunctioning radiator pressure cap can result in the loss of coolant and the engine operating above engine temperature guidelines.



ANADOLU ISUZU PARTS

Last Modified: 04-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

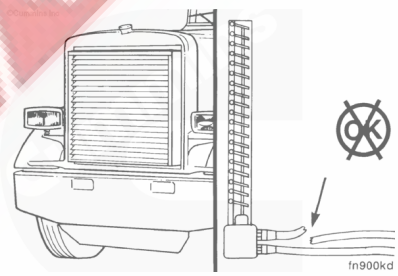
- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

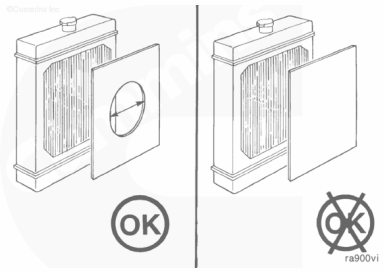
General Information

Shutters are designed to control airflow across the radiator. If the shutters fail to open when needed, the engine can run hot. Failure of the shutters to close can result in too much airflow and the engine running cold.



Note : Make sure the air temperature sensor is functioning correctly. Check the air-operated shutter controls. Check for air leaks. See equipment manufacturer service information.

Winterfronts can be used on a charge air cooled engine, but **must** be designed to cover part of the frontal area of the cooling system. A minimum of 77419 sq mm [120 sq in] of charge air cooled frontal area **must** be left open to airflow.



ANADOLU ISUZU
AFTER SALES

Last Modified: 04-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

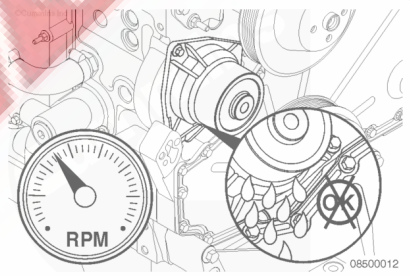
- No additional service items required.

Initial Check

Inspect the water pump impeller and housing for cracks and/or damage.

Note : A streak or chemical buildup or discoloration at the water pump is **not** justification for water pump replacement.

Only replace the water pump if a continuous stream of leakage is observed under operating conditions.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

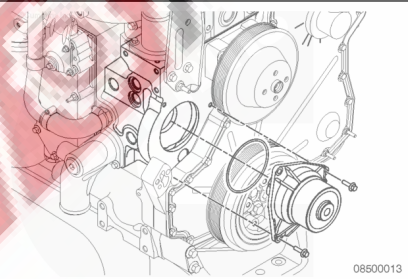
⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)

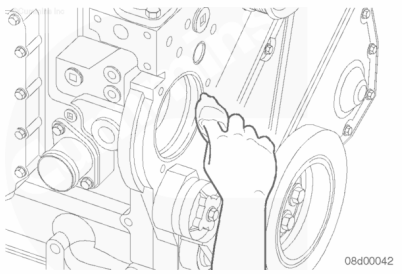
Remove

Remove the water pump capscrews and water pump.



Clean and Inspect for Reuse

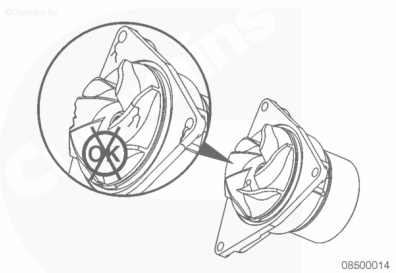
Clean the o-ring sealing surface on the water pump housing and cylinder block.



Inspect the impeller for cracks, missing blades, slippage on the shaft, and other types of damage.

Inspect the water pump housing for damage and cracks.

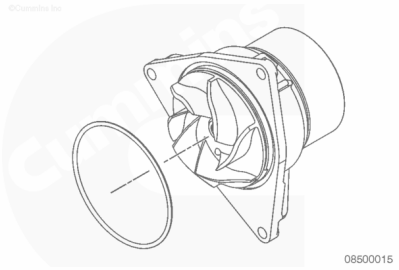
Replace the water pump if any damage is found.



ANADOLU ISUZU AFTER SALES

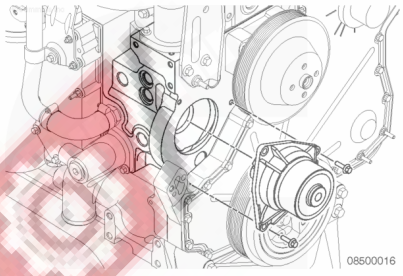
Install

Install a new sealing ring into the groove in the water pump housing.



Install the water pump.

Torque Value: 24 n•m [212 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU PARTS

Last Modified: 04-Aug-2016

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Pipe sealant, Part Number 3375066, or equivalent

Additional Service Items

- No additional service items required.

General Information

Note : For engines equipped with optional torque converter cooler.

Conventionally cooled engines with automatic transmissions typically use oil-to-water transmission torque converter coolers plumbed between the radiator and engine water pump.

A torque converter cooling system with a remote bypass allows the torque converter to receive coolant flow when the thermostat is closed (engine cold, no flow through the radiator).

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

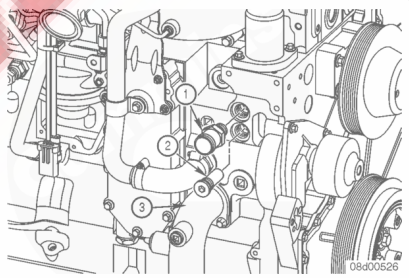
⚠ CAUTION ⚠

Use caution when draining coolant that coolant is not spilled or drained into the bilge area. Do not pump the coolant overboard. If the coolant is not reused, it must be discarded in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Disconnect the original equipment manufacturer (OEM) torque converter plumbing as required. See equipment manufacturer service information.

Remove

Note : Make sure to note the orientation and location when removing any 90 or 45 degree coolant line fittings.



Remove the M22 x 1.5 fitting and plug from the engine block coolant supply port.

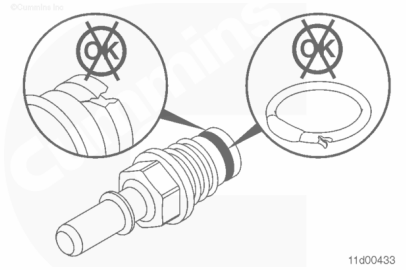
Remove the torque converter coolant return fitting from the water inlet connection or radiator return. Location and size depends on the OEM. See equipment manufacturer service information.

1. M22 x 1.5 fitting (supply port)
2. M22 plug
3. Water inlet connection.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the fittings. Use a cleaning solvent. Dry with compressed air.

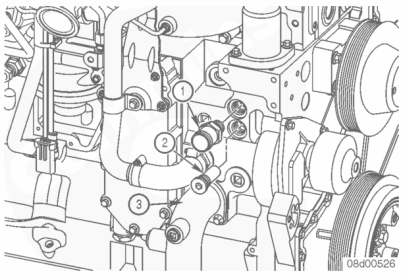
Inspect the fittings for cracks, corrosion, and other damage.

If a component is damaged, it **must** be replaced.

Install

⚠ CAUTION ⚠

The fitting and plug must be installed in the proper locations. The plug blocks off the thermostat bypass. Do not install the plug upstream of the torque converter cooler supply fitting. Doing so blocks off coolant flow to both the thermostat bypass and the torque converter cooler, severe engine damage can occur.



Note : When installing any 90 or 45 degree coolant line fittings, make sure to maintain proper orientation while tightening.

Apply a film of pipe sealant, Part Number 3375066, or equivalent, to the threads of the M22 fitting and plug.

Install the M22 x 1.5 fitting and plug into the engine block coolant supply port

Torque Value: 60 n•m [44 ft-lb]

Apply a film of pipe sealant, Part Number 3375066, or equivalent, to the threads of the torque converter coolant return fitting.

Install the torque converter coolant return fitting into the water inlet connection or radiator return. Location and size depends on the OEM. See equipment manufacturer service information.

Use the following procedure for torque values on various fittings sizes. Refer to Procedure 017-011 in Section 17. (/qs3/pubsys2/xml/en/procedures/100/100-017-011.html)

1. M22 x 1.5 fitting (supply port)
2. M22 plug
3. Water inlet connection.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

Always vent the engine during filling to remove air from the coolant system, or overheating can result.

- Connect the OEM torque converter plumbing as required. See equipment manufacturer service information.
- Fill the engine with coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU ISUZU

Last Modified: 04-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- Belt tensioner gauge, Part Number ST 1293, or equivalent

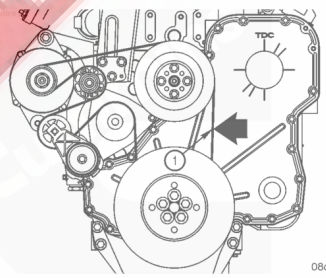
Additional Service Items

- No additional service items required.

Initial Check

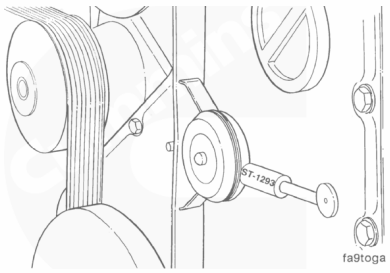
Check the belt deflection at the longest span of the belt. The deflection **must** be checked at the center (1) of the span.

The maximum deflection allowed in the belt is 9.5 to 12.7 mm [3/8 to 1/2 in].



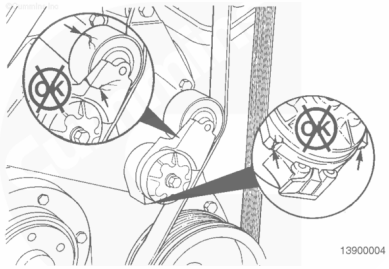
Use belt tensioner gauge, Part Number ST 1293, or equivalent, to measure the tension in the drive belt.

Belt Tension		
n		lbf
356	MIN	80
534	MAX	120



If the measurement is out of the specified range, replace **only** the belt. Perform the tension test again. If the measurement is still outside of the specified rang after the new belt has been installed, replace the belt tensioner.

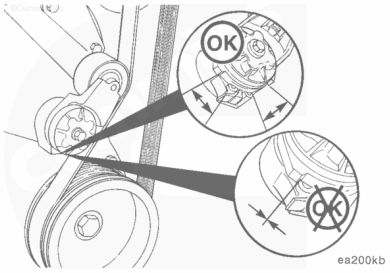
Check the tensioner arm, pulley, and stops for cracks. If any cracks are observed, the tensioner **must** be replaced.



ANADOLU ISUZU SPARE PARTS

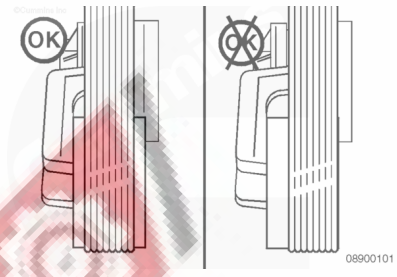
With the belt installed, verify neither tensioner arm stop is in contact with the spring casing stop. If either stop is touching, replace the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)

After replacing the belt, if the tensioner arm stops are still in contact with the spring case stop, replace the tensioner.



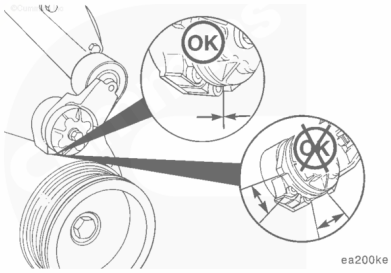
Check the location of the drive belt on the belt tensioner pulley. The belt **must** be centered on, or close to the middle of, the pulley. Misaligned belts, either too far forward or backward, can cause belt wear, belt roll-off failures, or increase uneven tensioner bushing wear.

Belt mis-alignment is **not always** a result of a malfunctioning or faulty belt tensioner. Make sure the adjacent pulleys and mounting brackets are aligned and mounted correctly. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)



Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)

With the belt removed, verify the tensioner arm stop is in contact with the spring case stop. If they are **not** touching, the tensioner **must** be replaced.



Preparatory Steps

⚠ WARNING ⚠

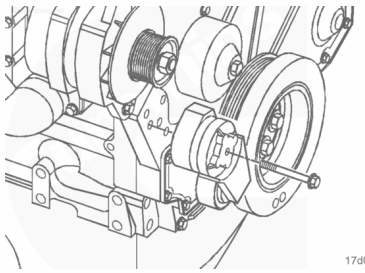
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)

Remove

Note : Most belt tensioners are mounted to the water inlet connection. Some belt tensioners are mounted to a separate mounting bracket and use internal fasteners for clearance.

Remove the capscrew and belt tensioner from the bracket.

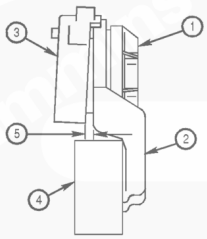


Inspect for Reuse

Inspect the cooling fan drive belt for reuse. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)

Measure the clearance between the tensioner spring case and tensioner arm to verify tensioner wear-out and uneven bearing wear. If the clearance at the measurement point 5 exceeds 3 mm [0.12 in], the tensioner is damaged and **must** be replaced as a complete assembly.

Tensioners generally will show a larger clearance gap near the lower portion of the spring case, resulting in the upper portion rubbing against the tensioner arm.

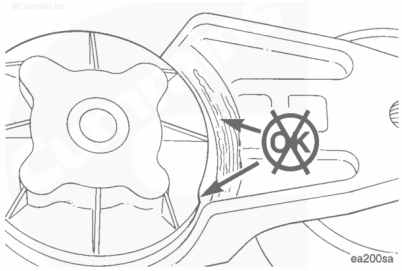


1. Tensioner cap
2. Tensioner arm
3. Spring case
4. Tensioner pulley
5. Clearance gap.

Note : Always replace the belt when a tensioner is replaced. However, it is **not always** necessary to replace a tensioner when a belt is replaced.

ANADOLU ISUZU
ISUZU SALES

Inspect the tensioner for evidence of the tensioner arm contacting the tensioner cap. If there is evidence of the two areas making contact, the pivot tube bushing has malfunctioned and the tensioner **must** be replaced.



Install

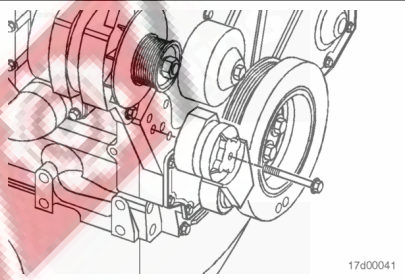
Note : Some belt tensioner mounting brackets use internal fasteners for clearance.

If removed, install the belt tensioner mounting bracket and mounting bracket capscrews.

Torque Value: 24 n•m [212 in-lb]

Install the belt tensioner and capscrew.

Torque Value: 43 n•m [32 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Connect the batteries. See equipment manufacturer service information.

General Information

The purpose of this procedure is to explain how to install and remove the selective catalytic reduction (SCR) coolant fittings that connect to the engine block.

The location and size of these fittings could possibly vary from original equipment manufacturer (OEM) to OEM. See equipment manufacturer service information for detailed information.

Generally, the SCR coolant supply port is located at the rear of the engine block on the exhaust side and the SCR coolant return port is located at the water inlet connection.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

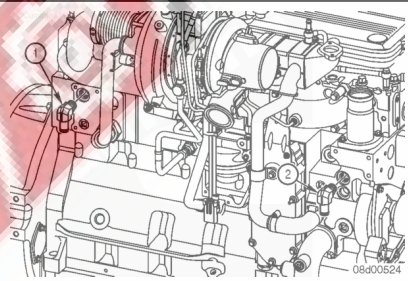
Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Disconnect the OEM SCR coolant plumbing as required. See equipment manufacturer service information.

Remove



Note : This step applies to the removal of SCR coolant plumbing fittings.

Note : Make sure to check proper orientation and location when removing any 90 or 45 degree coolant line fittings.

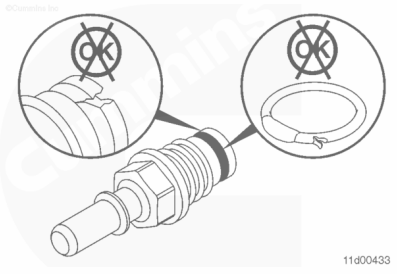
Remove the 3/4 - 14 NPT fitting from the engine block SCR coolant supply port.

Remove the SCR coolant return fitting. The location and size depends on the OEM. See equipment manufacturer service information.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury

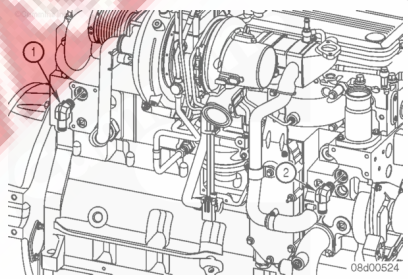
Clean the fittings. Use a cleaning solvent. Dry with compressed air.

Inspect the fittings for cracks, corrosion, or other damage.

If the component is damaged, the component **must** be replaced.

Install

Note : This step applies to the installation of the SCR coolant plumbing fitting.



Note : When installing any 90 or 45 degree coolant line fittings, make sure proper orientation is maintained while tightening.

Apply a film of pipe sealant, Part Number 3375066, or equivalent, to threads of the 3/4 - 14 NPT fitting.

Install the 3/4 - 14 NPT fitting into the engine block SCR coolant supply port.

Torque Value: 75 n•m [55 ft-lb]

Apply a film of pipe sealant, Part Number 3375066, or equivalent, to the threads of the SCR coolant return fitting.

Install the SCR coolant return fitting. Location and size depends on the OEM. See equipment manufacturer service information for detailed information.

Use the following procedure for proper torque values on various fitting sizes. Refer to Procedure 017-007 in Section 17. (/qs3/pubsys2/xml/en/procedures/99/99-017-007.html)

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the OEM SCR coolant plumbing as required. See equipment manufacturer service information.
- Fill the engine with coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Recommended Cummins® Service Tools

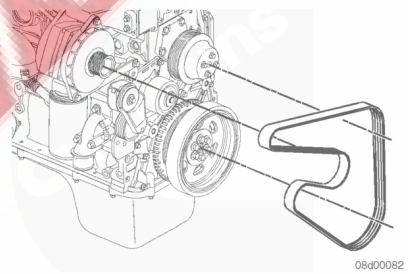
- No Cummins® service tools required.

Additional Service Items

- Belt gauge

General Information

Some refrigerant compressors use the cooling fan drive belt. Use the following procedure for information and instructions on these belts. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.

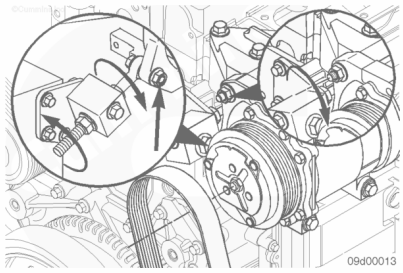
Remove

Loosen the pivot bolt.

Loosen the bolt that attaches the adjusting link to the compressor bracket.

Loosen the adjusting nuts on the adjusting link to remove tension from the belt.

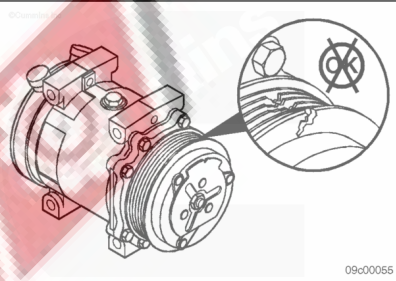
Remove the refrigerant compressor drive belt.



Inspect for Reuse

Inspect the refrigerant compressor pulley for cracks or broken grooves.

Replace the refrigerant compressor, if damaged.



Inspect the belt for cracks, glazing, tears or cuts, and excessive wear.

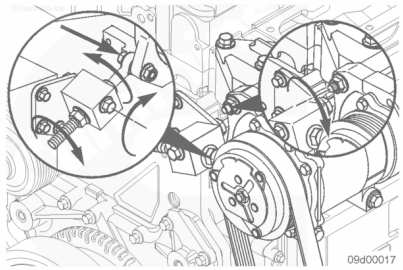
Replace the belt, if necessary.

Install

Tighten the pivot bolts and adjusting link bolts finger-tight.

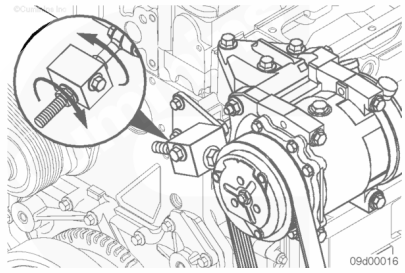
Tighten the bolt that attaches the adjusting link to the compressor bracket finger-tight.

Install the refrigerant compressor drive belt.

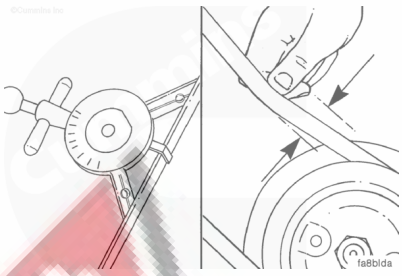


Use the adjusting nuts on the adjusting link to tighten the refrigerant compressor drive belt.

ANADOLU ISUZU AFTER SALES



Use a belt gauge to measure the belt tension. Use the following procedure for the correct gauge and tension value for the belt width used. Refer to Procedure 018-005 in Section V. (/qs3/pubsys2/xml/en/procedures/99/99-018-005.html)

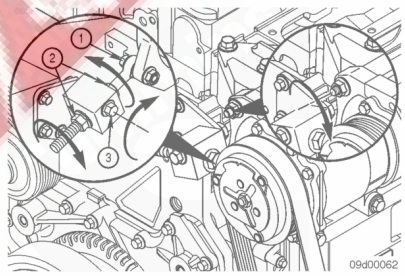


Tighten the pivot bolt, adjusting link bolts, and adjusting link to bracket mounting bolt.

Torque Value:
Pivot Bolt (1) 43 n•m [32 ft-lb]

Torque Value:
Adjusting Link Bolts (2) 77 n•m [57 ft-lb]

Torque Value:
Adjusting Link to Bracket Mounting Bolt (3) 43 n•m [32 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for belt squeal. Excessive belt squeal indicates belt slippage.
- If belt squeal is present, check the belt tension.

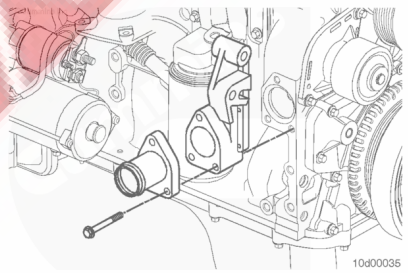
General Information

Some refrigerant compressor brackets are integral to the water inlet connection. Use the following procedure for information and instructions on these brackets. Refer to Procedure 008-082 in Section 8 . (/qs3/pubsys2/xml/en/procedures/425/425-008-082.html)



Preparatory Steps

⚠ WARNING ⚠

To protect the environment, liquid refrigerant systems must be properly emptied and filled using equipment that prevents the release of refrigerant gas into the atmosphere. Federal law requires capturing and recycling the refrigerant.

- Remove the refrigerant compressor belt. Refer to Procedure 009-052 in Section 9. (/qs3/pubsys2/xml/en/procedures/425/425-009-052.html)

Remove

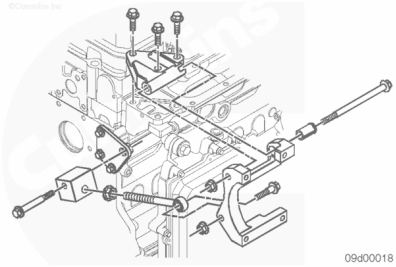
Remove the adjusting link capscrews.

ANADOLU ISUZU AFTER SALES

Remove the adjusting link.

Remove the pivot capscrew and refrigerant compressor support.

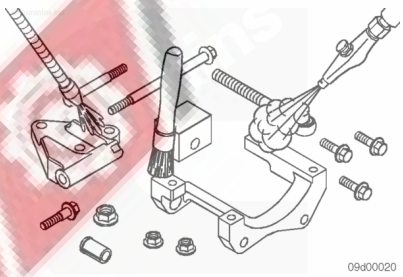
Remove the remaining capscrews and brackets.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



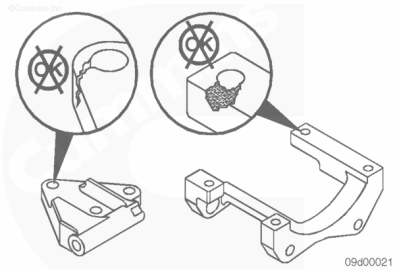
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the refrigerant compressor mounting brackets. Use solvent. Dry with compressed air.

Inspect the refrigerant compressor mounting brackets.

Replace the refrigerant compressor mounting bracket if cracked or otherwise damaged.



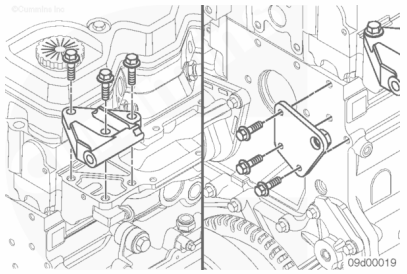
Install

Install the two mounting brackets and capscrews.

Tighten the capscrews.

Torque Value:
M8 23 n•m [204 in-lb]

Torque Value:
M10 43 n•m [32 ft-lb]



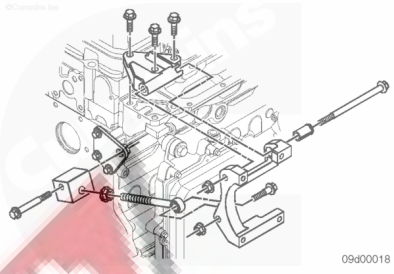
Install the refrigerant compressor support.

Install the pivot capscrew hand-tight.

Install the adjusting link.

Install the adjusting link capscrew hand-tight.

Tighten the adjusting link capscrews and pivot capscrew after the refrigerant compressor is installed and the drive belt has been tensioned. Refer to Procedure 009-052 in Section 9. (/qs3/pubsys2/xml/en/procedures/425/425-009-052.html)



Finishing Steps

- Install the refrigerant compressor belt. Refer to Procedure 009-052 in Section 9. (/qs3/pubsys2/xml/en/procedures/425/425-009-052.html)
- Operate the engine. Check for leaks.

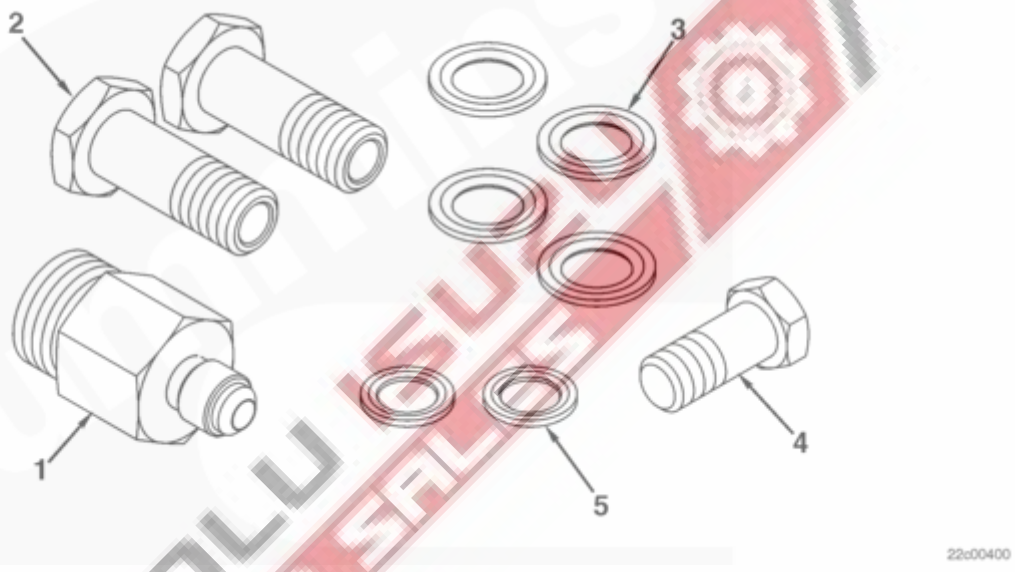
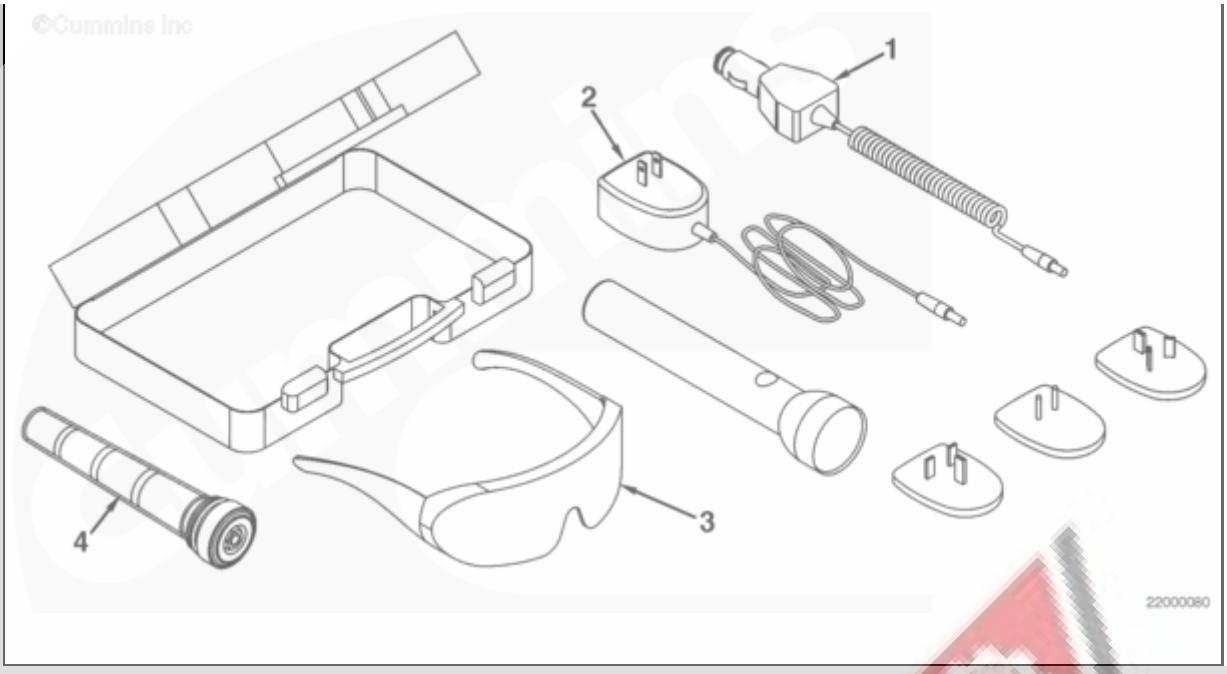
Air Intake System

Tool Number
2892101
Turbocharger Coolant Leak Test Kit This kit is used with air pressure regulator, Part Number 3164231, or equivalent, to perform a diagnostic leakdown test on the turbocharger coolant passages.



Tool Number
2892320
Black Light (VDC) Used to inspect for oil or fuel leaks.

©Cummins Inc

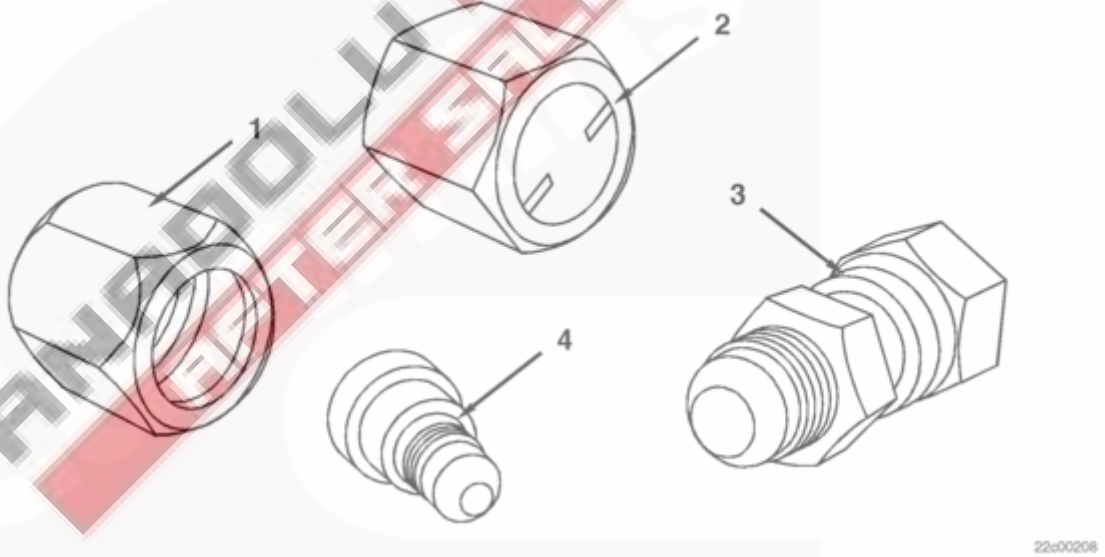


Tool Number

3164231

Air Pressure Regulator

This regulator will allow pressure testing of the water jacket on the new variable geometry turbocharger (VGT).

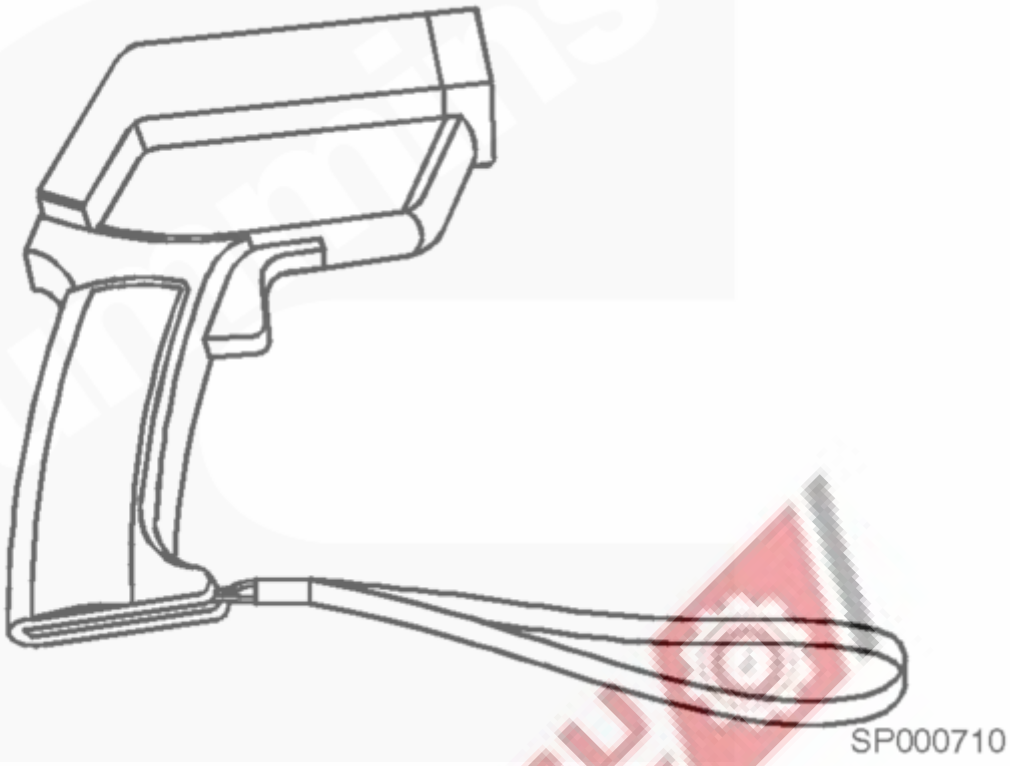


Tool Number

3164487

Infrared Thermometer

This small hand-held infrared digital thermometer is an excellent instrument to measure surface temperatures without actually making physical contact with a temperature probe.



Tool Number

3164488

Digital Multimeter

Used to measure electrical circuits: voltage (volts), resistance (ohms), and current (amperes).

Tool Number

3164489

Digital Multimeter (Standard Meter)

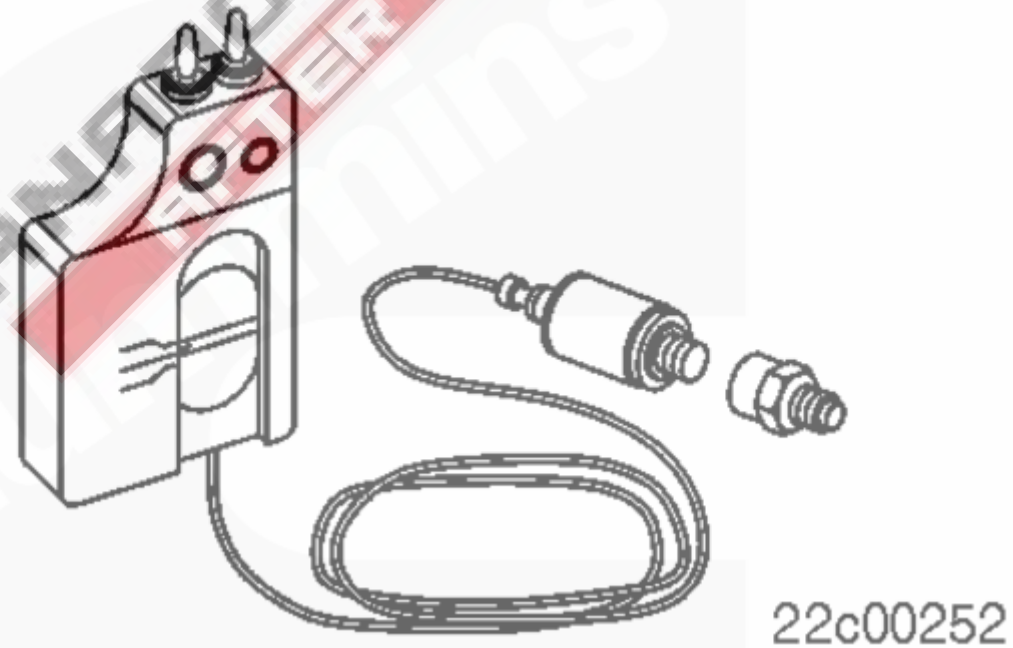
Automotive meter with built in temperature adapter and tachometer.

Tool Number

3164491

Pressure and Vacuum Module

Used with multimeter, Part Number 3164488, to measure pressures and vacuums.

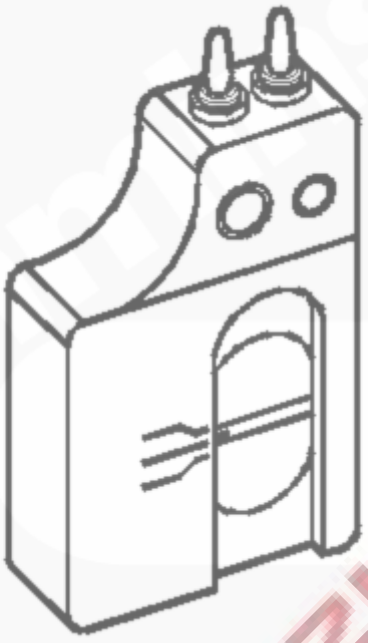


Tool Number

3164499

Digital Thermometer

Used to measure ambient air temperature. Used with digital multimeter, Part Number 3164488.



Tool Number

3375066

Thread Sealant

This product locks and seals threaded fluid fitting. This product resists leakage, vibration loosening, moisture, hydraulic fluids and diesel fuels, and other liquids. It also lubricates the threads for easy assembly and disassembly.

SP000797

Tool Number

3376891

Fluorescent Tracer

Used with black light, Part Number 2892930, to find oil leaks (added to oil).

3376891

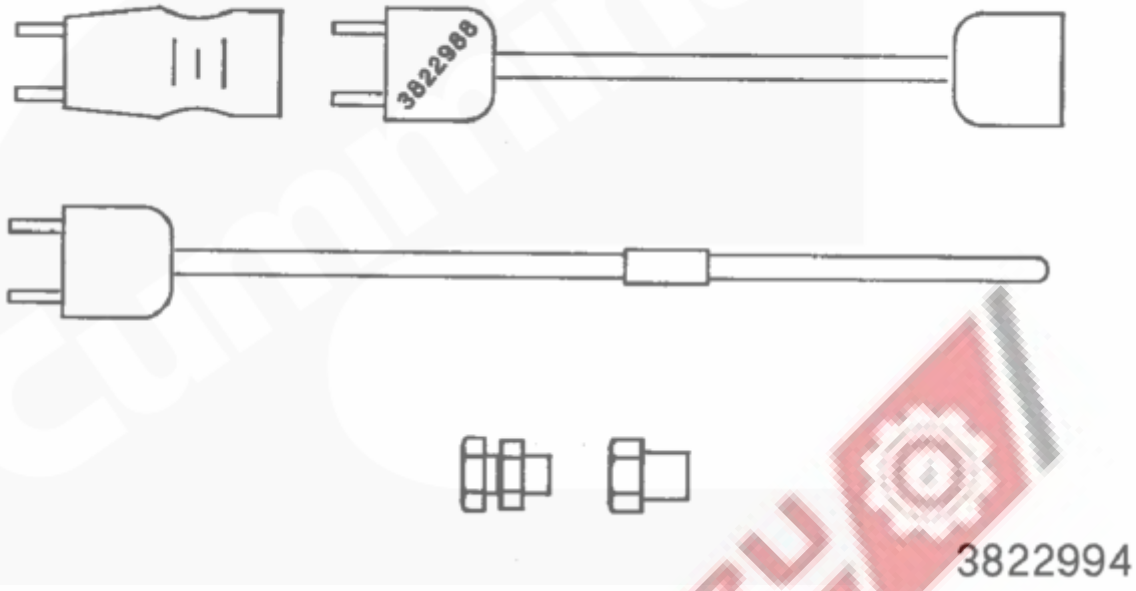
Tool Number

3822988

Thermocouple Wire Kit

Used to check temperature. Used with fluke digital multimeter, Part Number 3164488.

©Cummins Inc



Tool Number

3823205

Pressure Gauge (0 to 60 psi)

This test kit provides a special adapter (2) to fit in place of the rocker housing solenoid to measure oil supply pressure as desired. The gauge (1), hose, and adapter are included in the kit.

ANADOLU ISUZU AFTER SALES

Recommended Cummins® Service Tools

- Air Handling Clean Care Kit, Part Number 5298776

Additional Service Items

- No additional service items required.

General Information

The air inlet connection connects the turbocharger air inlet to the original equipment manufacturer (OEM) air inlet piping.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

Note : Brush away all loose dirt from around the area of the air handling connections to avoid contamination of the interior of the engine.

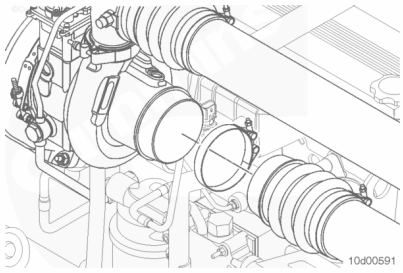
- Disconnect the batteries. See equipment manufacturer service information.
- Remove the air crossover pipe attached to the intake connection. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)

Remove

Loosen the clamps which hold the air inlet connection to the turbocharger air inlet and OEM air inlet piping.

Remove the air inlet connection. Take care **not** to get any dirt or debris inside the turbocharger.

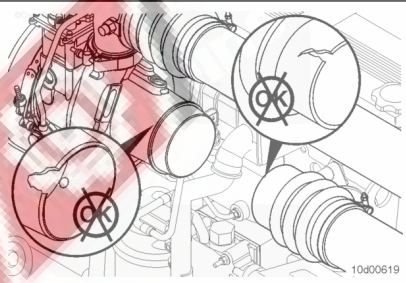
Use protective caps from Air Handling Clean Care Kit, Part Number 5298776, to cover both connection points.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Use skin and eye protection when handling caustic solutions to reduce the possibility of personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the piping and connections. Use solvent or hot, soapy water. Dry with compressed air.

Check the piping and connections for cracks, holes, and worn sections.

If any damage is found, replace the damaged components.

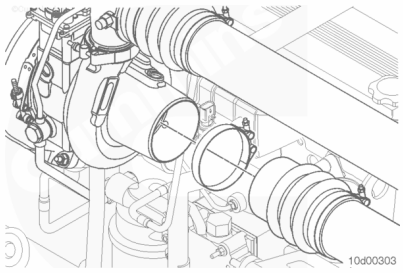
Install

Make sure to remove all protective caps from the components.

Install the air inlet piping and connections.

Tighten the attaching clamps.

See equipment manufacturer service information for correct torque specification.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the air crossover pipe that is attached to the connection. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

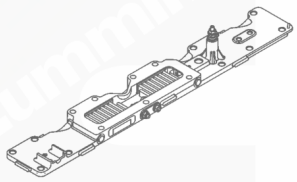
Additional Service Items

- Heavy tape
- Gasket scraper

Initial Check

Verify the cold starting aid is functioning properly. Refer to Procedure 010-029 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-029.html)



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

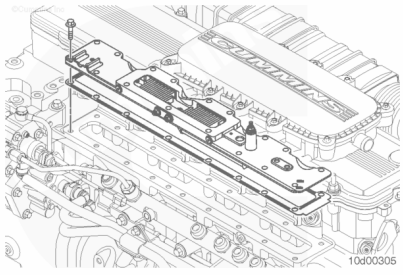
ANADOLU ISUZU AFTERSALES

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

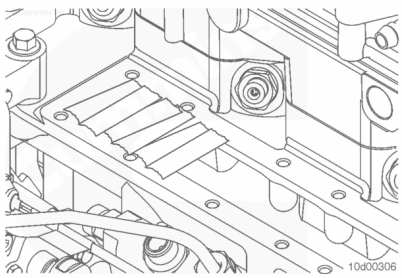
- Disconnect the batteries. See equipment manufacturer service information.
- Steam clean the area around the air intake manifold to remove any loose dirt or debris. Dry with compressed air.
- Disconnect the electrical connection from the cold starting aid. See equipment manufacturer service information.
- Remove the charge air piping from the air intake connection adapter. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Remove the engine intake throttle actuator. Refer to Procedure 010-140 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-140.html)
- Remove the exhaust gas recirculation (EGR) connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Remove the EGR valve. Refer to Procedure 011-022 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-022.html)
- Remove the air intake connection. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)
- Remove the injector supply lines. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Remove the intake manifold pressure/temperature sensor. Refer to Procedure 019-159 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-159.html)
- Disconnect the injector pass through connectors.

Remove

Remove the remaining capscrews holding the air intake manifold to the cylinder head.



Use heavy tape to cover the intake manifold opening in the cylinder head to prevent debris from entering the engine.



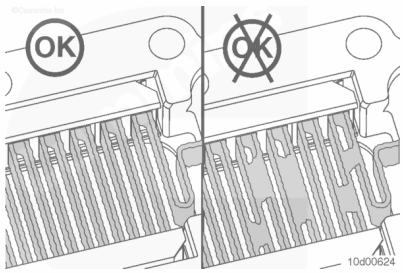
ANADOLU ISUZU PARTS SALES

Clean and Inspect for Reuse

Inspect the air intake manifold heater for plugging and soot buildup.

Soot **only** covering individual elements is acceptable.

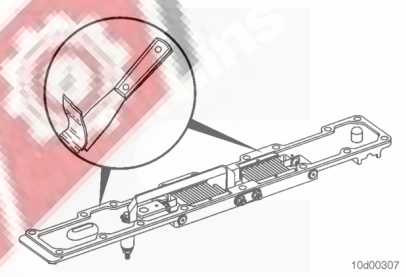
If plugged with soot bridging the heating elements check for the source: turbocharger, air compressor, temperature/pressure sensor, relay, and wiring harness. Replace the air intake manifold heater if necessary.



Note : The cold starting aid and air intake manifold will be coated with a layer of carbon. This carbon coating is normal.

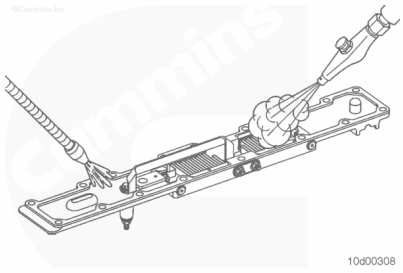
Note : The air intake manifold can have a corrosion-resistant coating on the inside. Take care **not** to scratch or otherwise damage this coating.

Scrape the gasket surfaces with a gasket scraper on both the intake manifold and cylinder head. Take care **not** to drop any gasket material into the cylinder head.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

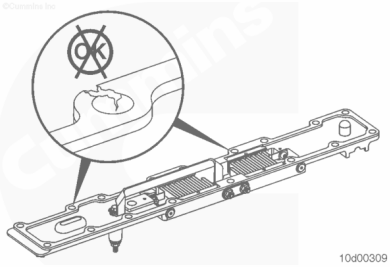
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the intake manifold and cold starting aid. Use solvent. Dry with compressed air.

Inspect the air intake manifold for cracks, warping, or other damage. Replace, if necessary.

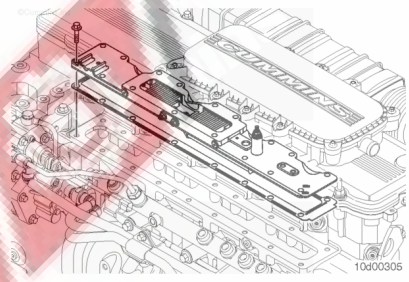
Note : The air intake manifold and cold starting aid are an integral unit. If the cold starting aid needs to be

replaced, the entire intake manifold **must** be replaced.



Install

If previously taped off, remove the tape from the cylinder head prior to installing the intake manifold.



If a new air intake manifold is being installed, verify the correct voltage manifold is being installed. Both 12 VDC and 24 VDC versions exist.

Install the air intake manifold to the cylinder head with a new gasket.

Lightly coat the threads of the capscrews with thread sealant, Part Number 3824041, to prevent boost leaks. This is **only** necessary if reusing the capscrews.

Tighten the capscrews in a crisscross pattern, starting from the middle of the manifold.

Torque Value: 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the injector supply lines. Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html)
- Connect the injector pass through connectors.
- Install the intake manifold pressure/temperature sensor. Refer to Procedure 019-159 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-159.html)

ANADOLU ISUZU AFTER SALES

- Install the air intake connection. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)
- Install the EGR valve. Refer to Procedure 011-022 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-022.html)
- Install the EGR connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Install the engine intake throttle actuator. Refer to Procedure 010-140 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-140.html)
- Install the charge air piping to the air intake connection adapter. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Connect the electrical connection to the cold starting aid. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Last Modified: 04-Aug-2016

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

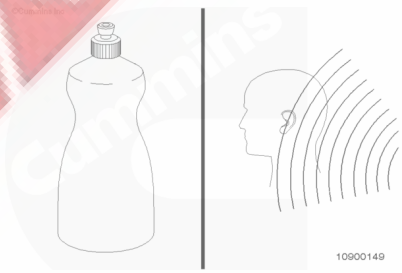
Additional Service Items

- No additional service items required.

Initial Check

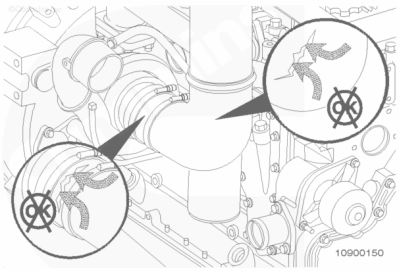
Leaks in the intake air system are most commonly identified by:

1. Inspection of piping for cracked or loose clamps
2. Applying a solution of soapy water in the suspected area and inspecting for bubbles
3. Listening for a high-pitched whining or sucking noise in the suspected area.



⚠ CAUTION ⚠

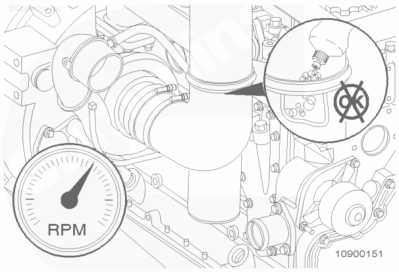
Engine intake air must be filtered to prevent dirt and debris from entering the engine. If intake air piping is damaged or loose, unfiltered air will enter the engine and cause premature wear.



Inspect the inlet air piping for cracked hoses and damaged or loose clamps.

Operate the engine at high idle. Use a solution of soapy water to spot intake air leaks.

If an air leak exists, the soap bubbles will be drawn in with the air.



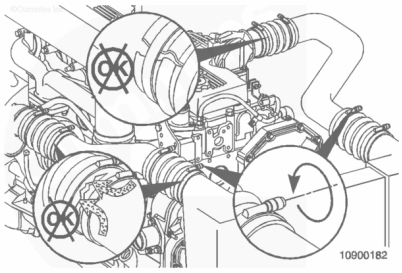
Replace damaged pipes and tighten loose clamps to make sure the charge air piping and hoses do **not** leak.

Torque Value: 10 n•m [89 in-lb]

ANADOLU ISUZU
USED SALES

Check for corrosion of the inlet system piping under the clamps and hoses. Corrosion can allow corrosive products and dirt to enter the intake system.

Disassemble and clean, as required.

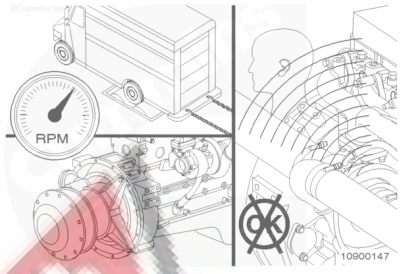


Operate the engine at full throttle and rated rpm with maximum load.

Listen for a high-pitched whistling sound from the turbocharger, nearby piping, and connections.

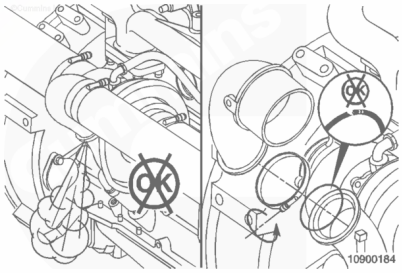
Apply a soapy water solution to sealing surfaces. Inspect for bubbles. Bubbles can be easily detected.

Note : During an active regeneration event, a high-pitched whistling sound emitting from the turbocharger can be present at low engine speeds and light engine loads. This sound is normal and does **not** signify an air leak.



Leaks can also be found at the turbocharger compressor outlet connection.

Inspect for damage, replace the sealing o-ring, and tighten loose clamps. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)

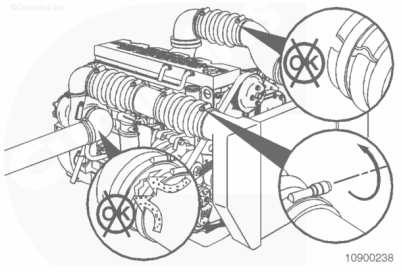


Charge Air Cooler Tubing or Connecting Hoses:

Inspect the hose and tubing for damage. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)

Tighten loose clamps.

See the equipment manufacturer service information for the correct torque value.

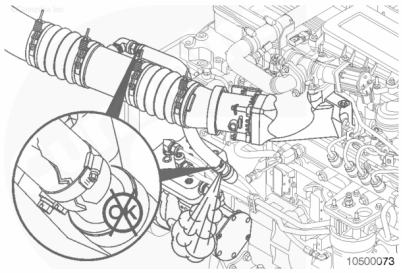


Air Compressor Plumbing:

The air compressor is supplied with turbocharged air **only**.

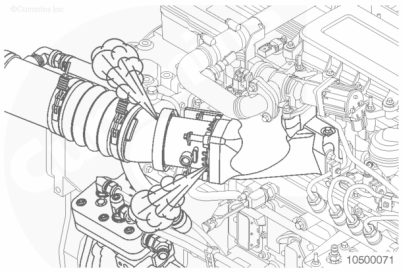
Inspect the original equipment manufacturer (OEM) air supply hose, fittings, and clamps for damage.

Tighten loose clamps and fittings.



Replace the OEM air supply hose, fittings, or clamps, if necessary. See equipment manufacturer service information.

Air Intake Connection, Engine Intake Throttle Actuator, Air Intake Connection Adapter:



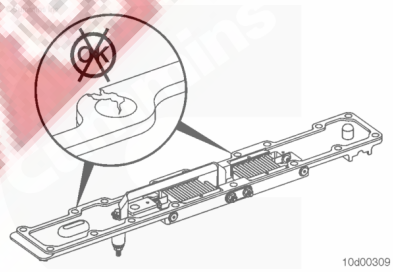
Inspect for damage.

Replace the connection clamp, o-ring, or gasket, if necessary.

Refer to Procedure 010-140 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-140.html)

Refer to Procedure 010-131 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-131.html)

Intake Manifold:



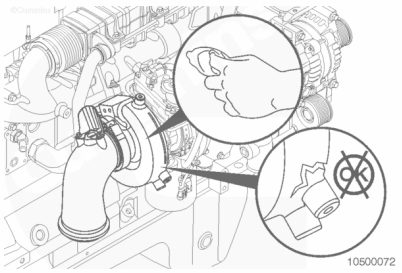
Inspect for damage.

If damage is found, replace the gasket if the engine was originally equipped with a gasket.

Open Crankcase Ventilation System:

Inspect for damage, tighten loose fittings, and replace cracked or leaking hoses and piping.

Compressor Housing:



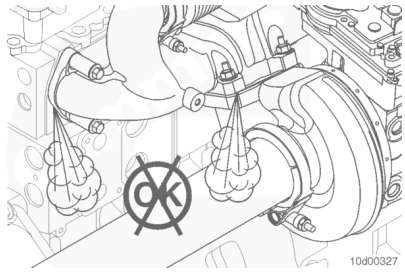
Clean and inspect for cracks in the compressor housing.

Tighten the clamp, if loose.

Exhaust System:

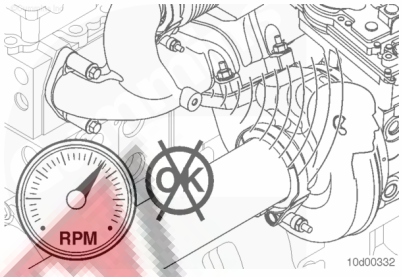
Leaks in the exhaust system will cause the turbocharger to operate at a lower speed, reducing the amount of air going to the cylinders during engine operation.

ANADOLU ISUZU AFTER SALES



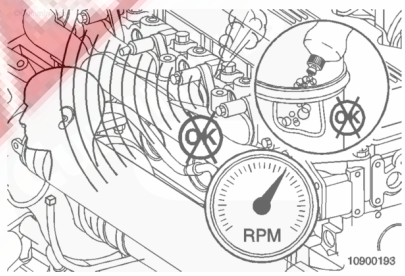
Operate the engine at full throttle and rated rpm with maximum load.

Leaks can be identified by noise, soapy water, or discoloration caused by the escaping hot gases.



Operate the engine at full throttle and rated rpm with maximum load.

Listen and inspect again for leaks.



Leaks can be found at:

- Exhaust manifold gaskets
- Turbocharger mounting gaskets
- Turbine housing sealing surface
- Exhaust gas recirculation (EGR) component gaskets
- EGR cooler inlet gasket
- EGR cooler outlet gasket
- EGR valve inlet gasket
- EGR valve mounting gasket.

ANADOLU ISUZU AFTER SALES

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Air Handling Clean Care Kit, Part Number 5298776
- Charge air cooler tester, Part Number 4919085
- Pressure gauge, Part Number 3823205 - Quantity 2
- Thermocouple bead probe, Part Number 3164498
- Digital multimeter, Part Number 3164488
- Temperature adapter, Part Number 3164499
- Air Handling Clean Care Kit, Part Number 4919508

Additional Service Items

- Spray bottle of soapy water
- Rubber mallet

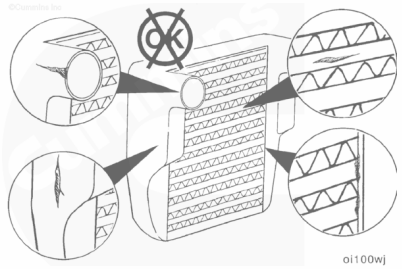
Initial Check

Inspect the charge air cooler for cracks, holes, and other damage.

Inspect the tubes, fins, and welds for tears, breaks, or other damage.

If any damage causes the charge air cooler to fail the air leak check, the charge air cooler **must** be replaced.

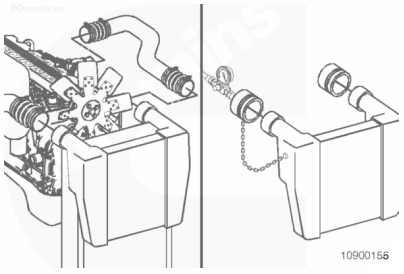
Inspect the charge air cooler plumbing for cracks and other damage.



Leak Test

⚠ WARNING ⚠

To prevent possible injury if either plug blows off during the test, secure safety chains on the test plugs to any convenient capscrew on the radiator assembly. This test must not be performed without securely fastened safety chains.



ANADOLU ISUZU AFTER SALES

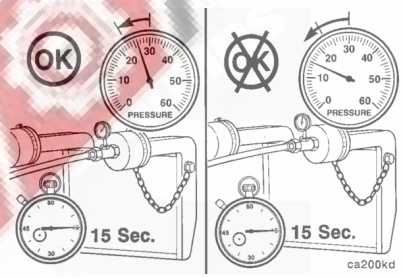
To check the charge air cooler for cracked tubes or header, remove the inlet and outlet hoses from the cooler. The charge air cooler does **not** have to be removed from the chassis.

Use protective caps from Air Handling Clean Care Kit, Part Number 5298776, to cover open points on the plumbing, engine, and charge air cooler.

Install a plug or cap over the outlet side of the cooler. Install a pressure gauge and a regulated shop air supply line with a shutoff valve to the inlet side of the cooler.

Use charge air cooler tester, Part Number 4919085.

Apply air pressure to the cooler until the pressure gauge reads a steady 207 kPa [30 psi] of air pressure.

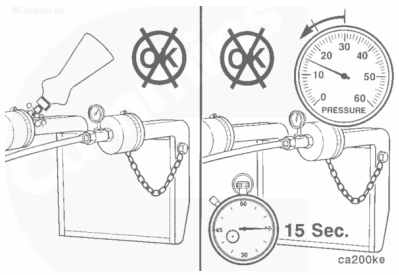


Shut off the air flow to the cooler and start a stopwatch at the same time. Record the leakage at 15 seconds.

If the pressure drop is 48 kPa [7 psi] or less in 15 seconds, the cooler is operational.

If the pressure drop is greater than 48 kPa [7 psi] in 15 seconds, check all connections again.

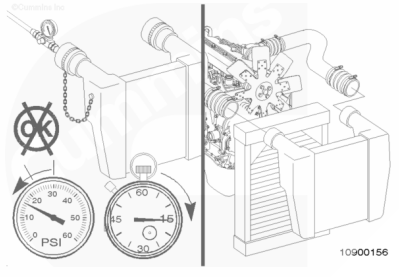
Determine if the pressure drop is caused by a leak in the charge air cooler or by a leaky connection. Use a spray bottle filled with soapy water, applied to all hose connections. Watch for bubbles to appear at the location of the leak.



If the pressure drop is caused by a leaky connection, repair the connection, and repeat the test. If the leak is within the charge air cooler, repeat the test to verify the accuracy of the pressure drop measurement. Similar pressure drop readings **must** be obtained at least three consecutive tests before the reading can be considered accurate.

Note : If a charge air cooler leak causes a pressure drop of more than 48 kPa [7 psi] in 15 seconds, it will appear as a major leak in a leak tank.

If the pressure drop is greater than 48 kPa [7 psi] in 15 seconds, the charge air cooler **must** be replaced.



See equipment manufacturer service information for replacement instructions.

ANADOLU ISUZU PARTS SALES

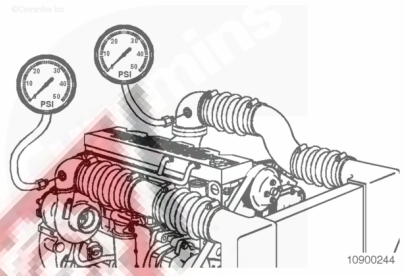
Note : Charge air coolers are **not** designed to be 100 percent leak-free. If the pressure drop is less than 48 kPa [7 psi] in 15 seconds, the charge air cooler does **not** need to be replaced.

Pressure Test

Obtain two pressure gauges, Part Number 3823205. Check both gauges on the same pressure source at 206 kPa [30 psi] to verify consistency.

Install one pressure gauge in the 1/8 inch fitting in the turbocharger compressor outlet elbow. Install the other pressure gauge in the intake manifold.

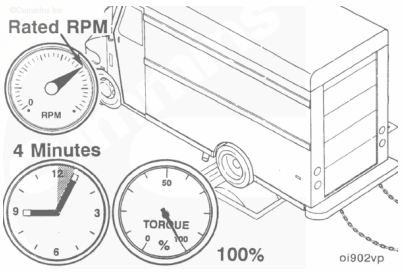
Another alternative to measure the intake manifold pressure is to use the monitor mode on INSITE™ electronic service tool.



Operate the engine at rated rpm and load. Record the readings on the two gauges.

If the differential pressure is greater than 20.6 kPa [3 psi], check the charge air cooler and associated piping for plugging, restrictions, or damage.

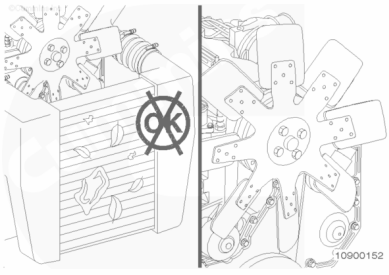
Clean or replace, if necessary.



Temperature Differential Test

Inspect the charge air cooler fins for obstructions to air flow. Remove obstructions such as a winterfront or debris. Manually lock the shutters in the OPEN position, if equipped.

Lock the fan drive in the ON mode to prevent erratic test results. This can be done by installing a jumper wire across the temperature switch.

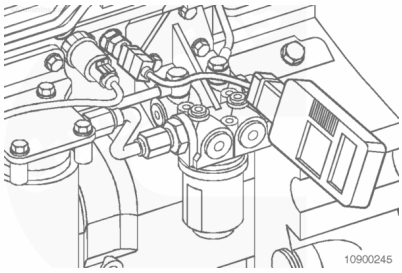


Install thermocouple bead probe, Part Number 3164498.

Connect digital multimeter, Part Number 3164488, and temperature adaptor, Part Number 3164499, to the thermocouple bead probe to read intake air temperature.

Another alternative is to use the monitor mode on the INSITE™ electronic service tool.

Install another thermocouple at the air cleaner inlet to measure ambient air temperature.



Perform a road test with the engine at peak power and a vehicle speed of 48 kph [30 mph] or greater.

Record the intake manifold temperature and ambient air temperature.

Calculate the differential temperature:

- Intake manifold temperature - ambient air temperature = differential temperature.
- Maximum Differential Temperature: 21°C [38°F].

If the temperature differential is greater than the specifications, check the charge air cooler for dirt and debris on the fins. Clean, as necessary. If the problem still exists, check the charge air cooler for debris in the fins or between the charge air cooler and radiator. Confirm full fan engagement.

ANADOLU ISUZU AFTER SALES

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

- Disconnect the batteries. See equipment manufacturer service information.
- Clean debris from the outside of the charge air cooler. Use compressed air.

- Remove the charge air cooler piping. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)

Remove

Remove the charge air cooler. See equipment manufacturer service information.

Use protective caps from Air Handling Clean Care Kit, Part Number 4919508, to cover open points on the plumbing, engine, and charge air cooler.

Clean

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ CAUTION ⚠

Do not use caustic cleaners to clean the charge air cooler. Damage to the charge air cooler will result.

Note : If the engine experiences a turbocharger failure or any other occasion where oil or debris is put into the charge air cooler, the charge air cooler **must** be cleaned.

Flush the charge air cooler internally with solvent in the opposite direction of normal airflow. Shake the charge air cooler, and lightly tap on the end tanks with a rubber mallet to dislodge trapped debris. Continue flushing until all debris or oil is removed (i.e., the water runs clear).

Note : Make sure the tubes are in the upright position when flushing.

If the debris can **not** be totally removed from the charge air cooler, the charge air cooler **must** be replaced.

Install

Install the charge air cooler. See equipment manufacturer service information for instructions.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the charge air cooler piping. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU KUZEY AFTER SALES

Last Modified: 01-Nov-2016

Select Service Tools

Recommended Cummins® Service Tools

- Voltmeter, Part Number 3164489, or equivalent
- Infrared non-contact thermometer, Part Number 3164457

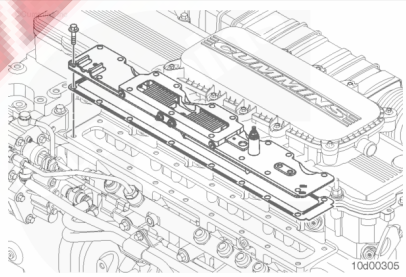
Additional Service Items

- No additional service items required.

General Information

The cold starting aid is **not** a serviceable part.

If the cold starting aid has cracked, broken, or melted elements, the entire air intake manifold **must** be replaced. Refer to Procedure 010-023 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-023.html)



ISL preheat information:

The cold starting aid **must** be actuated prior to a cold start, which is termed “preheat”. Preheat time is determined as a function of the average of the intake manifold temperature sensor reading and the coolant temperature sensor reading at keyswitch ON, as shown in Figure 1.

ANADOLU ISUZU
OTOMOTIV SATIS

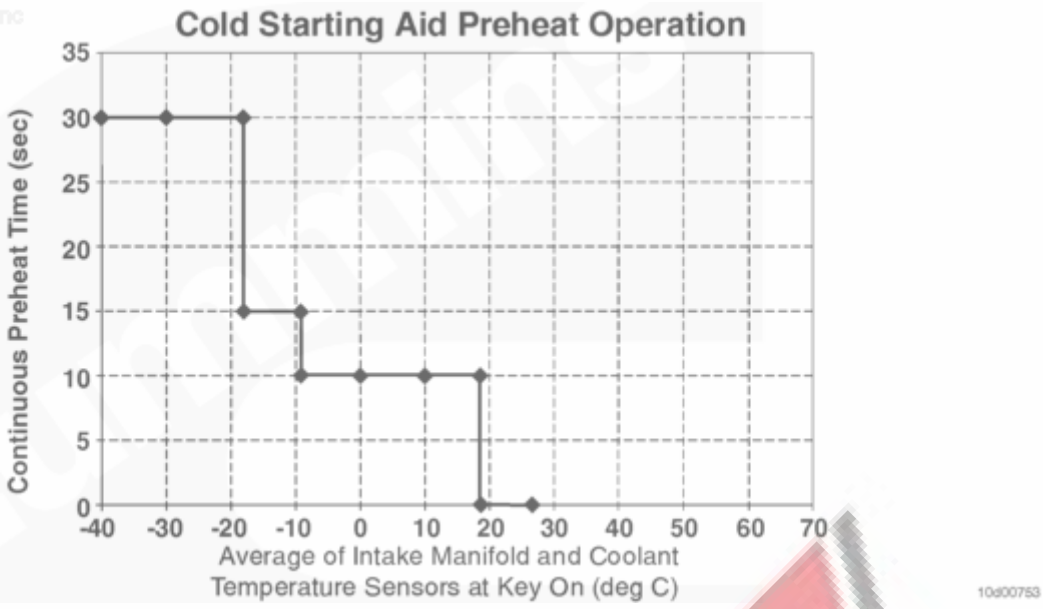


Figure 1: Cold Starting Aid Preheat Cycle

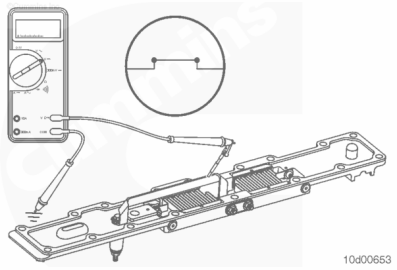
After a cold start, the cold starting aid **must** be activated during warm-up, which is termed “post-heat”. The post-heat schedule is determined by the average of the intake manifold temperature sensor reading and the coolant temperature sensor reading at key ON. Post-heat is deactivated at speeds greater than 30 kph [18.6 mph] if equipped with a vehicle speed sensor. The cold starting aid post-heat operates for minimum of 30 seconds if the average of the intake manifold temperature sensor and the coolant temperature sensor is below 49°C [120°F]. The post-heat operation is turned OFF if the temperature is above this threshold. The actual duration is calculated by the ECM and is a function of engine speed and the average of the intake manifold temperature sensor and the coolant temperture sensor.

Test

Verify cold starting aid operation.



Use voltmeter, Part Number 3164489, or equivalent, and connect the negative test lead to the block ground.

Connect the positive test lead to the electrical connector of the cold starting aid.

Connect INSITE™ electronic service tool. From the list of "Diagnostic Tests" select "Grid Heater Override".

Turn ON the cold starting aid for a few seconds, and note the voltage read by the voltmeter, then turn it OFF again. The voltmeter **must** read within 1 VDC of battery voltage. If it does **not**, there is problem with the wiring or the power jumper in the manifold.

Check the cold starting aid relay circuit. Refer to Procedure 019-408 in Section 19. (/qs3/pubsys2/xml/en/procedures/99/99-019-408.html)

Check the original equipment manufacturer (OEM) wiring and cold starting aid relay functionality. See equipment manufacturer service information for instructions.

Repair the wiring as necessary.

If the electrical connection reads close to battery voltage, turn ON the cold starting aid using the "Grid Heater Override" test. To check if the cold starting aid is heating, use infrared non-contact thermometer, Part Number 3164457. If the air intake manifold does **not** heat, it **must** be replaced.

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

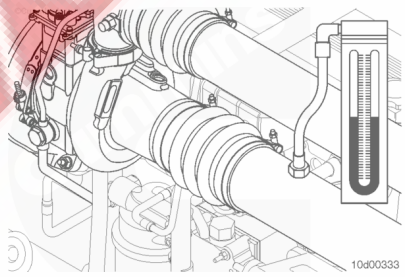
Additional Service Items

- Vacuum gauge or water manometer

Measure

Install a vacuum gauge or water manometer in the intake air piping.

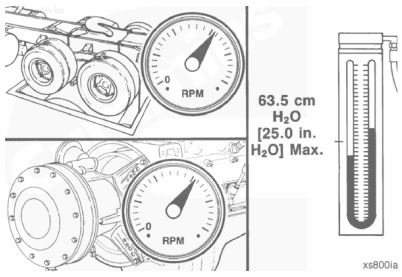
The gauge adapter **must** be installed at a 90 degree angle to the airflow in a straight section of pipe, one pipe diameter before the turbocharger.



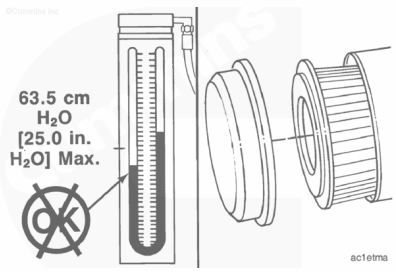
Operate the engine at full throttle and rated rpm with maximum load.

Record the data on the gauge or manometer.

Inlet Air Restriction		
cm H_2O		**in H_2O**
63.5	MAX	25.0



If restriction exceeds specifications, replace or clean the air filter element. See equipment manufacturer service information.



Inspect the intake piping for damage. See equipment manufacturer service information.

Remove the test equipment.

AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Air Handling Clean Care Kit, Part Number 5298776
- Turbocharger Coolant Leak Test Kit, Part Number 2892101
- Air Pressure Regulator Kit, Part Number 3164231
- Dial depth gauge, Part Number ST 537

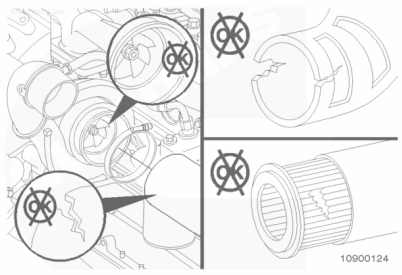
Additional Service Items

- Anti-seize compound

Initial Check

⚠ CAUTION ⚠

Do not operate the engine with the charge air piping removed. The lack of boost pressure on the outlet side of the compressor outlet can cause progressive damage to the turbocharger.



Remove the intake pipe from the turbocharger. See the Remove section in this procedure.

Install protective caps from Air Handling Clean Care Kit, Part Number 5298776, on all open connection points.

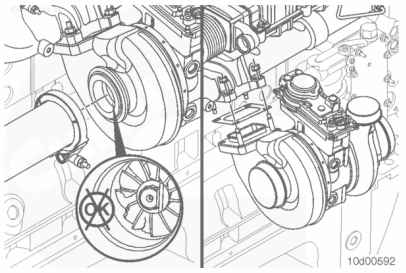
Inspect the turbocharger compressor impeller blades for damage.

Replace the turbocharger if damage is found. See the Remove and Install sections in this procedure.

If the turbocharger compressor impeller is damaged, do the following:

- Inspect the intake piping and filter element for damage.
- Repair any damaged parts before operating the engine.
- See High Blowby and Lubricating Oil Consumption Caused by Dirt and Dust Ingestion, Service Bulletin 5613318 (/qs3/pubsys2/xml/en/bulletin/5613318.html).

Remove the exhaust pipe from the turbocharger. See the Remove section in this procedure.



Install protective caps from Air Handling Clean Care Kit, Part Number 5298776, on all open connection points.

Inspect the turbine wheel for damage.

Replace the turbocharger if damage is found.

If turbine wheel is damaged, see Prevention of Turbocharger Damage After Engine Mechanical Issue, Service Bulletin 4326040 (/qs3/pubsys2/xml/en/bulletin/4326040.html).

Lubricating oil leaks from the compressor (cold-side) or turbine (hot-side) seals can be symptoms of air restrictions, leaks, or a restricted turbocharger oil drain line.

If a turbocharger is leaking oil, see Turbocharger Lubricating Oil Leak Troubleshooting, Service Bulletin 5504213 (/qs3/pubsys2/xml/en/bulletin/5504213.html).

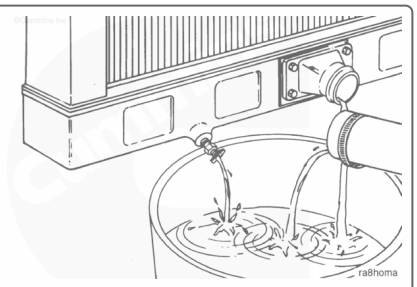
After review of the above service bulletin, reference the following troubleshooting symptom trees in Section TS, if necessary.

- Turbocharger - Compressor Seal Oil Leak troubleshooting symptom tree
- Turbocharger - Turbine Seal Oil Leak troubleshooting symptom tree.

Leak Test

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.



⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

ANADOLU ISUZU AFTER SALES

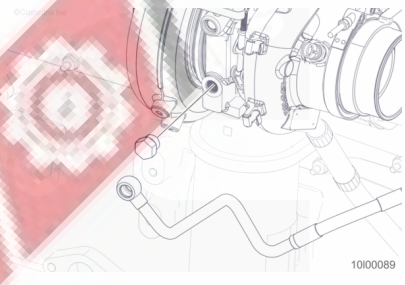
This test **only** needs to be performed if troubleshooting for coolant loss, or if an internal leak is suspected.

Note : The engine **must** be within 3°C or 5°F of ambient temperature to perform the test.

If a turbocharger internal coolant leak is suspected, use the Turbocharger Coolant Leak Test Kit, Part Number 5299505, or equivalent, along with Air Pressure Regulator Kit, Part Number 3164231, or equivalent, to check for a leak.

- Drain the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)

To test for either a turbocharger bearing housing internal coolant leak or a leaking variable geometry turbocharger (VGT) actuator, disconnect the coolant inlet line to the bearing housing and install the M16 banjo block-off fitting from the Turbocharger Coolant Leak Test Kit, Part Number 5299505, or equivalent.

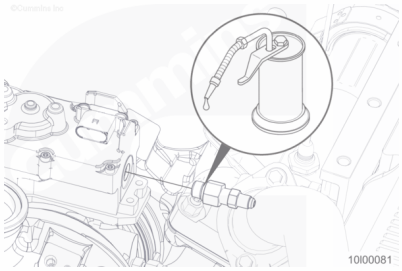


Lubricate the o-ring with clean engine oil before installation.

Torque Value: 27 n•m [239 in-lb]

Disconnect the turbocharger coolant return line at the VGT and install the adapter fitting for the pressure regulator supplied with Turbocharger Coolant Leak Test Kit, Part Number 5299505.

Disconnect the turbocharger actuator coolant return line at the turbocharger actuator and install the plug supplied with Turbocharger Coolant Leak Test Kit, Part Number 5299740, to block off the turbocharger actuator coolant outlet port.

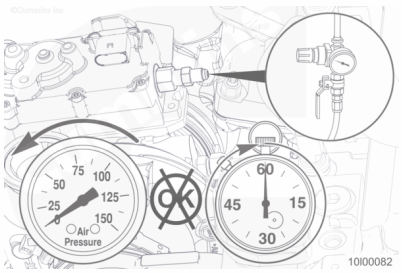


Lubricate the o-ring with clean engine oil before installation.

Torque Value: 27 n•m [239 in-lb]

⚠ WARNING ⚠

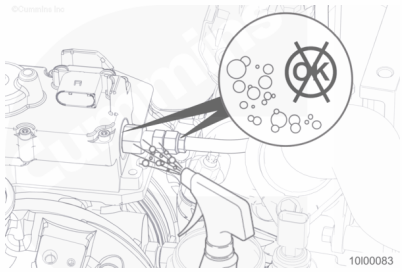
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



- Use compressed air supply to pressurize the VGT to 276 kPa [40 psi].
- Close the air pressure regulator.

- Watch for the pressure to decrease. The pressure **must not** decrease more than 34 kPa [5 psi] in 1 minute.

- If the pressure decreases, use a spray bottle of soapy water to wet the coolant leak test connections and threaded joints. Bubbles will appear if the connections or threaded joints are leaking
- If the pressure decreases and the hose connections or threaded joints are **not** leaking, continue to the next step.
- If the pressure does **not** decrease, no leaks have been detected in the VGT. Proceed to the next steps for testing the actuator for coolant leaks.



Remove the electric VGT actuator. Refer to Procedure 010-134 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html)

Inspect the pressure testing plate o-ring. Replace the o-ring if damage is found.

Install the pressure testing plate onto the turbocharger bearing housing with the o-ring facing the turbocharger bearing housing.

Tighten the capscrews.

Torque Value: 11 n•m [97 in-lb]

Use compressed air supply to pressurize the turbocharger bearing housing to 276 kPa [40 psi].

Close the air pressure regulator.

Watch for the pressure to decrease. The pressure **must not** decrease more than 34 kPa [5 psi] in 1 minute.

If the pressure decreases, use a spray bottle of soapy water to wet all hose connections. Bubbles will appear if the connections are leaking.

If the pressure decreases and the hose connections are **not** leaking, replace the turbocharger.

If no external leak source is detected, the coolant leak is internal to the electric VGT actuator. Replace the electric VGT actuator. Refer to Procedure 010-134 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html)

ANADOLU ISUZU AFTER SALES

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oilcan be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

Note : Brush away all loose dirt from the around the area of the air handling connections to avoid contamination of the interior of the engine.

Note : For front-out exhaust configurations, the turbocharger will need to be removed with both coolant return and oil supply lines installed to the bearing housing.

Note : Take note of oil and coolant line orientation prior to removal and install in the same manner. Do **not** lift the turbocharger by the coolant return lines.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the oil supply line from the turbocharger. Refer to Procedure 010-046 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-046.html)
- Remove the oil drain line from the turbocharger. Refer to Procedure 010-045 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-045.html)

- Remove the turbocharger coolant lines. Refer to Procedure 010-041 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-041.html)
- Disconnect the turbocharger actuator wiring harness by unlocking the tang and pressing down to release the tab.
- Disconnect the turbocharger speed sensor. Refer to Procedure 019-390 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-390.html)
- Remove the exhaust piping. See equipment manufacturer service information.
- Remove the turbocharger outlet connection. Refer to Procedure 010-132 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-132.html)
- Remove the turbocharger compressor air inlet connections. Refer to Procedure 010-132 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-132.html)

Remove

⚠ WARNING ⚠

This component or assembly weighs greater than 23kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift the component or assembly.

Care **must** be taken **not** to damage the turbocharger sensors or the turbocharger actuator coolant lines when removing the turbocharger from the engine.

Remove the four turbocharger mounting nuts.

Remove the turbocharger and discard the gaskets.

Cover the turbocharger exhaust inlet port with a cap from Air Handling Clean Care Kit, Part Number 5298776. Cover the openings on the exhaust manifold with heavy tape.

If required, remove the turbocharger actuator. Refer to Procedure 010-134 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html)

Clean and Inspect for Reuse

Clean the turbocharger and exhaust manifold gasket surfaces.

Inspect the turbocharger and exhaust manifold gasket surfaces, and the mounting studs for cracks or other damage.

Cracking of the turbine housing inlet flange may require turbocharger replacement.

Acceptance and rejection guidelines are shown in this illustration. If the exhaust gasket is available, always make sure any cracks lie within its sealing area.

Acceptable cracks **must**:

- be 10 mm [0.39 in] or less in length
- be separated from each other by no less than 10 mm [0.39 in]
- **not** extend to the edge of the flange.

Replace the exhaust manifold if any cracks or other damage is found in the mounting flange surfaces. Refer to Procedure 011-007 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-007.html)

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Remove all carbon deposits and gasket material from surfaces.

Clean the exterior of the turbocharger. Use solvent or steam. Dry with compressed air.

Inspect the turbine and compressor housings.

If cracks through the outer walls are found, the turbocharger **must** be replaced.

Axial Clearance Check

- Use dial depth gauge, Part Number ST 537.
- Push the rotor assembly away from the gauge.
- Set the gauge on zero.
- Push the rotor assembly toward the gauge. Record the reading.

Axial Clearance (HE300 Variable Geometry)		
mm		in
0.025	MIN	0.001
0.127	MAX	0.005

Replace the turbocharger if the clearance does **not** meet the specifications. See the Remove and Install sections in this procedure.

Radial Clearance Check:

- Check the radial movement of the rotor system by pushing the turbocharger compressor wheel toward the wall of the compressor cover with light finger pressure.
- The turbocharger passes inspection if the wheel does **not** contact the compressor cover wall.
- Repeat the procedure on the turbocharger turbine wheel.

Replace the turbocharger if there is contact between the turbine wheel and turbine housing or compressor wheel and compressor housing. Reference the Remove and Install sections in this procedure.

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ CAUTION ⚠

Do not use caustic cleaners to clean the charge air cooler. Damage to the charge air cooler will result.

Make sure all system level causes of oil leaks have been addressed before proceeding. Reference the following troubleshooting symptom trees in Section TS:

- Turbocharger - Compressor Side Oil Leak troubleshooting symptom tree
- Turbocharger - Turbine Side Oil Leak troubleshooting symptom tree.

Clean turbocharger outlets with a non-reactive oil cleaning spray or solution, Part Number 3824421, or equivalent, and a lint-free towel.

Note : If the engine experiences a turbocharger malfunction or any other occasion in which oil or debris is put into the charge air system, the charge air system **must** be inspected and cleaned. Refer to Procedure 010-027 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-027.html)

Note : If the engine experiences a turbocharger malfunction that resulted in coolant or oil entering the intake, the charge air cooler system, as well as the exhaust gas recirculation (EGR) differential pressure cross drillings should be inspected and cleaned. Refer to Procedure 010-027 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-027.html) Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)

Note : If the engine experiences a turbocharger malfunction or any other occasion where oil is put into the exhaust, the aftertreatment components **must** be inspected. Inspect the aftertreatment diesel oxidation catalyst. Refer to Procedure 011-049 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-049.html) Inspect the aftertreatment diesel particulate filter. Refer to Procedure 011-041 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-041-tr.html)

Note : If a malfunction resulted in oil, excessive fuel, or excessive black smoke entering the exhaust system, the aftertreatment system **must** be inspected. Refer to the Aftertreatment Diesel Oxidation Catalyst and Aftertreatment Diesel Particulate Filter Reuse Guidelines, Bulletin 4021600. (/qs3/pubsys2/xml/en/bulletin/4021600.html)

Note : If a malfunction resulted in coolant entering the exhaust system, the aftertreatment system can be recovered. Refer to Procedure 014-016 in Section 14.

(/qs3/pubsys2/xml/en/procedures/425/425-014-016.html)

Install

⚠ WARNING ⚠

This component or assembly weighs greater than 23kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift the component or assembly.

Note : For front-out exhaust configurations, the turbocharger will need to be installed into the chassis with both coolant return and oil supply lines installed and tightened to specification onto the bearing housing.

Torque Value:
Banjo Fitting 24 n•m [212 in-lb]

Torque Value:
Swivel Nuts 35 n•m [26 ft-lb]

Note : Make sure to install the lines in the proper orientation.

Note : If installing a new turbocharger, orient the compressor housing to the same position as the turbocharger that was removed. Orient the housing by loosening the V-band clamp and then positioning the housing in the correct location. Do **not** orient the turbine housing.

Torque Value: 8 n•m [71 in-lb]

Only remove clean care caps as the connections are being made.

Apply a film of high-temperature anti-seize compound to the turbocharger mounting studs.

Install a new gasket and install the turbocharger.

Install and tighten the four mounting nuts.

Note : The torque values have been established with anti-seize compound as a lubricant.

Torque Value: 55 n•m [41 ft-lb]

ANADOLU ISUZU GLOBAL SALES

If required, install the turbocharger actuator. Refer to Procedure 010-134 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html)

Prime

Install the turbocharger oil drain line. Refer to Procedure 010-045 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-045.html)

Lubricate the bearings by pouring 59 to 89 ml [2 to 3 oz] of clean engine oil into the turbocharger oil supply line fitting. Rotate the turbine wheel to allow the oil to enter the bearing housing.

Rotate the turbine wheel to allow the oil to enter the bearing housing.

Note : If too much oil is poured into the bearing housing, the oil can leak past the seals. This is **not** regarded as a malfunction, since the seals are **not** dynamic and rely on exhaust gas and boost pressure to provide a proper seal.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

Note : If a stationary aftertreatment regeneration is needed to complete repair, make sure the engine is brought up to operating temperature before the regeneration is started.

- Install the turbocharger compressor air inlet connection. Refer to Procedure 010-132 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-132.html)
- Install the turbocharger compressor outlet connection. Refer to Procedure 010-132 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-132.html)
- Install the exhaust piping. See equipment manufacturer service information.

- Connect the turbocharger speed sensor. Refer to Procedure 019-390 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-390.html)
- Connect the turbocharger actuator wiring harness. Make sure the tab locks and the locking tang slides into place.
- Connect the turbocharger coolant lines. Refer to Procedure 010-041 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-041.html)
- Install the turbocharger oil supply line. Refer to Procedure 010-046 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-046.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Last Modified: 04-Feb-2020

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

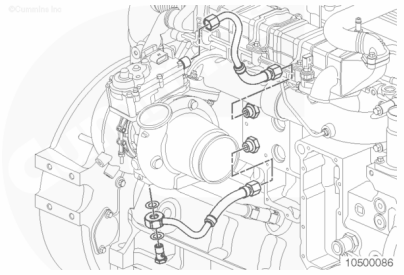
Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)

Remove

Remove the turbocharger coolant drain and supply lines.

Note : Use a second wrench to hold the coolant connection fittings at the cylinder block and turbocharger bearing housing to prevent accidental loosening of the fittings. Hold the turbocharger coolant supply line while loosening to prevent kinking the line.

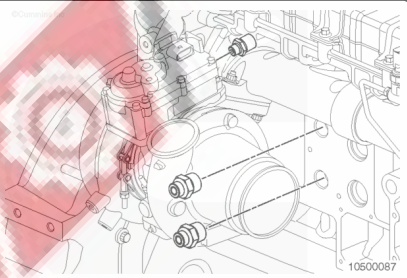


Disassemble

Remove the coolant return and supply line block fittings from the engine block.

Remove the coolant return line fitting from the turbocharger actuator.

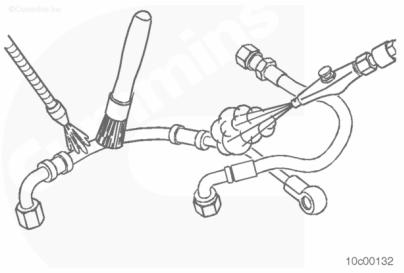
Remove the coolant supply line fitting from the turbocharger bearing housing, if applicable.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

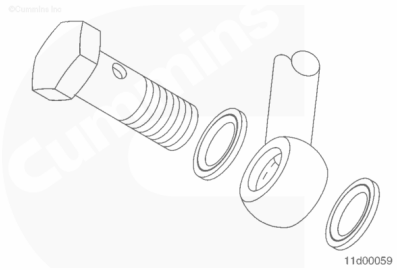
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the turbocharger coolant hoses. Use solvent. Dry with compressed air.

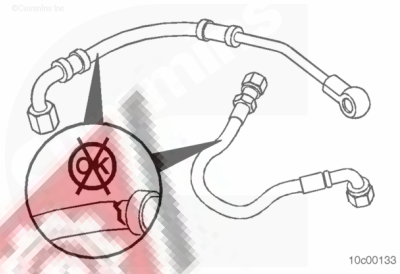
Note : New sealing washer **must** be used when installing the banjo fitting.

Inspect the banjo fittings for dirt, debris, and burrs. Replace as necessary.

A sealing washer is used on both sides of a banjo fitting.



Inspect the coolant hoses for cuts, leaks, cracks, or other damage. Replace as necessary.



Assemble

Install the coolant return and supply line block fittings from the engine block.

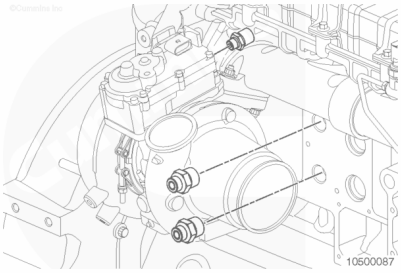
Torque Value: 65 n•m [48 ft-lb]

Install the coolant return line fitting from the turbocharger actuator.

Torque Value: 25 n•m [18 in-lb]

Install the coolant supply line fitting from the turbocharger bearing housing, if applicable.

Torque Value: 35 n•m [26 ft-lb]



Install

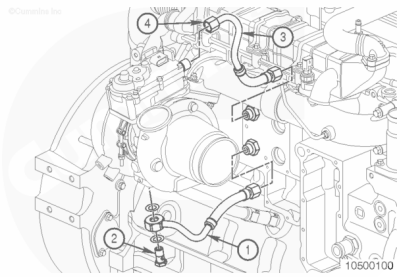
Install the turbocharger coolant supply line.

Torque value at block fitting (1):

Torque Value: 35 n•m [26 ft-lb]

Torque value at turbocharger bearing housing (2):

Torque Value: 35 n•m [26 ft-lb]



ANADOLU ISUZU

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.

Remove

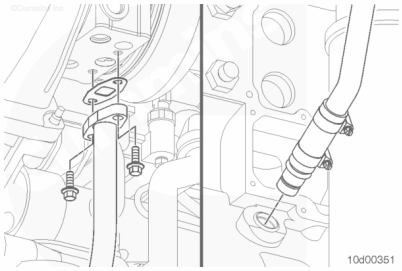
Clean around the area where the oil drain line inserts into the cylinder block. Use a clean cloth.

Loosen the hose clamps that hold the upper oil drain tube to the oil drain hose.

Remove the two capscrews that hold the upper oil drain tube to the turbocharger. Discard the gasket.

Remove the upper oil drain tube from the turbocharger and oil drain hose.

Pull the oil drain hose and lower drain tube out of the cylinder block.

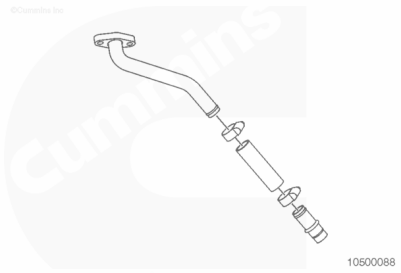


ANADOLU ISUZU
AFTER SALES

Disassemble

Remove the oil drain hose from the lower oil drain tube.

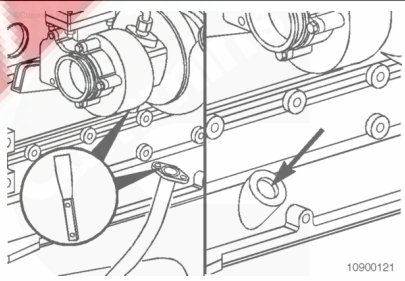
Soap and warm water may be required.



Clean and Inspect for Reuse

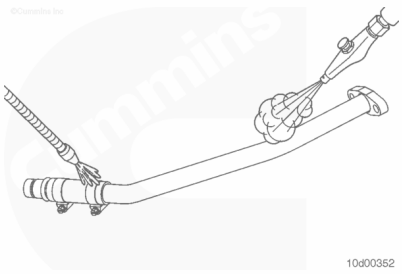
Clean the gasket sealing surfaces on the oil drain line and turbocharger.

Clean the o-ring sealing bore in the cylinder block, taking care **not** to drop any dirt or debris into the cylinder block.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

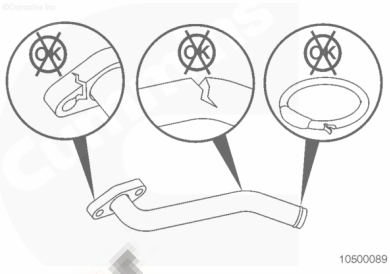
Clean the turbocharger oil drain line. Use solvent. Dry with compressed air.

Inspect the oil drain line for any signs of oil coking or restriction.

Clean the inside of the oil drain line if it shows signs of oil coking or restriction.

Inspect the oil drain tubes and hose for signs of cracks, wear, leaks, or other damage. Replace as necessary.

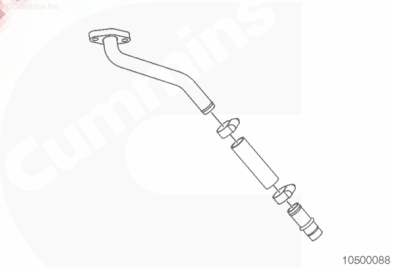
Inspect the oil drain sealing o-rings for signs of cracks, wear, or fretting. Replace as necessary.



Assemble

Assemble the oil drain hose onto the bottom oil drain tube.

Soap and warm water may be required.



Install

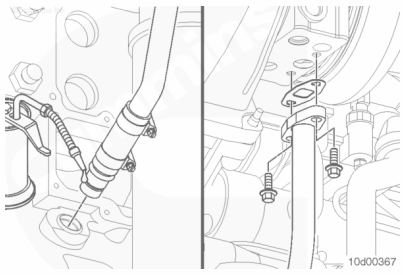
Apply a thin film of clean engine oil to the drain line o-rings.

Push the assembled oil drain hose and lower oil drain tube into the cylinder block. Make sure both o-rings are completed seated in the bore.

Install a new gasket to the upper oil drain tube.

Insert the upper oil drain tube into the oil drain hose. Align to the turbocharger oil drain.

Install and tighten the upper drain tube capscrews.



Torque Value: 23 n•m [204 in-lb]

Tighten the hose clamps.

Torque Value: 5 n•m [44 in-lb]

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

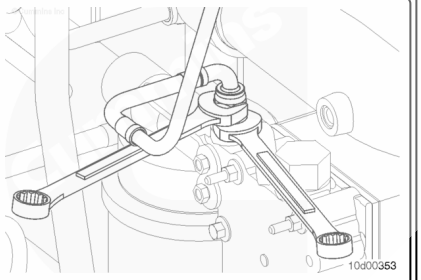
When handling the oil supply line, avoid bending the flexible portion into a tight bend, as this will cause damage to the flexible material. It is advisable to remove the line from the engine, when servicing the engine, to avoid accidentally overbending the flexible material.

- Disconnect the batteries. See equipment manufacturer service information.
- Clean around the oil supply line fittings. Use a clean cloth.

Remove

⚠ CAUTION ⚠

When handling the oil supply line, avoid bending the flexible portion into a tight bend, as this will cause damage to the flexible material. It is advisable to



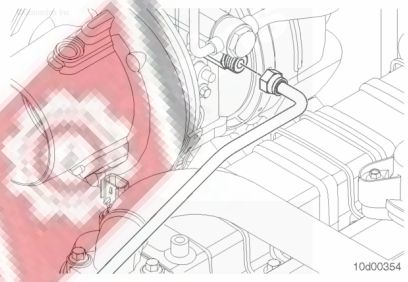
remove the line from the engine, when servicing the engine, to avoid accidentally overbending the flexible material.

Note : Use a wrench to hold the fittings below the oil supply line on both the turbocharger bearing housing and oil filter head. This will prevent the fittings from loosening.

Remove the oil supply line from the fitting in the oil filter head.

Remove the oil supply line from the turbocharger bearing housing fitting.

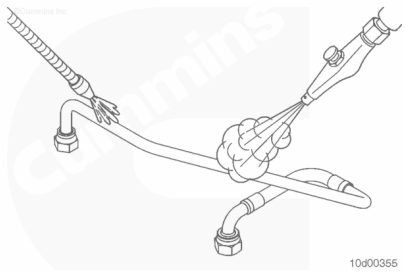
Discard the old o-ring seals.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

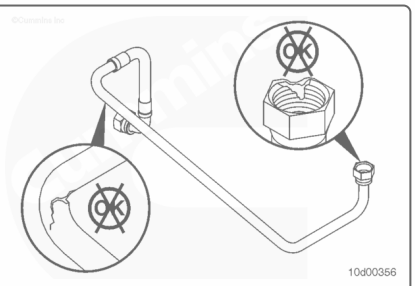
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

When handling the oil supply line, avoid bending the flexible portion into a tight bend, as this will cause damage to the flexible material. It is advisable to remove the line from the engine, when servicing the engine, to avoid accidentally overbending the flexible material.

Clean the oil supply line. Use solvent. Dry with compressed air.

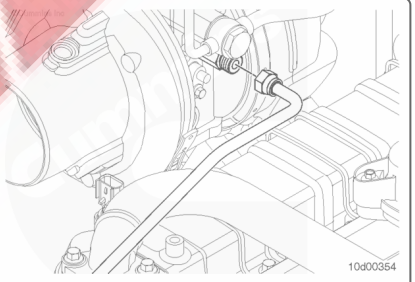
Inspect the oil supply line for cracks, wear, kinks, burns, and other damage that can cause an oil leak.



Install

⚠ CAUTION ⚠

When handling the oil supply line, avoid bending the flexible portion into a tight bend, as this will cause damage to the flexible material. It is advisable to remove the line from the engine, when servicing the engine, to avoid accidentally overbending the flexible material.



Apply a thin film of clean engine oil to the oil supply line o-ring seals.

Install the oil supply line to the turbocharger and to the oil filter head. Use new o-ring seals. Hand tighten.

Note : Use a wrench to hold the fitting below the oil supply line on the turbocharger bearing housing. This will prevent the fitting from being overtightened.

Install the oil supply line to the turbocharger and to the oil filter head. Hand tighten.

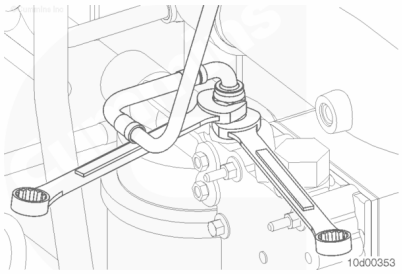
Tighten the oil supply line at the turbocharger bearing housing.

Torque Value: 24 n•m [212 in-lb]

⚠ CAUTION ⚠

Maintain at least 10 mm [0.40 in] clearance between the turbocharger oil supply line and the turbocharger turbine housing and exhaust manifold.

Note : Use a wrench to hold the fitting below the oil supply line on the oil filter head. This will prevent the fitting from being overtightened.



Tighten the oil supply line at the oil filter head fitting.

Torque Value: 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

General Information

⚠ WARNING ⚠

The exhaust and exhaust components can remain hot after the engine has been shut down or secured. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they might come in contact with hot exhaust or exhaust components.

⚠ WARNING ⚠

Improper practices, carelessness, or ignoring the warnings can cause burns, cuts, mutilation, asphyxiation, or other personal injury or death.

There are several turbocharger turbine housing mounted heat shield designs. The heat shield reduces heat exposure to chassis components from the turbocharger turbine housing.

Due to the number of turbocharger mounting configurations and heat shield designs, this procedure has been written to be generic. the Remove and Install sections are common regardless of the style of the heat shield used.

Preparatory Steps

⚠ WARNING ⚠

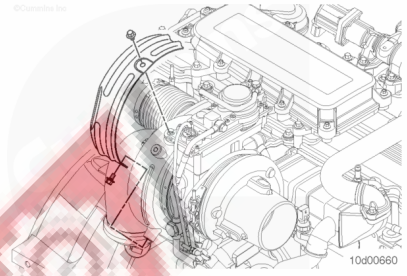
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery

cable last.

- Disconnect the batteries. See equipment manufacturer service information.

Remove

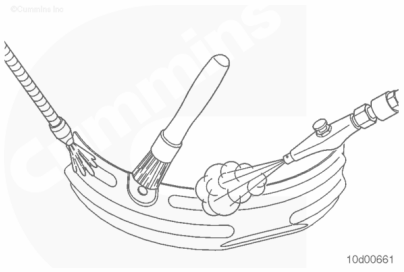
Remove the capscrews securing the turbocharger heat shield to the turbocharger turbine housing.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the turbocharger heat shield. Use solvent or steam.
Dry with compressed air.

Inspect the turbocharger heat shield.

If cracks or other damage is found, replace the turbocharger heat shield.

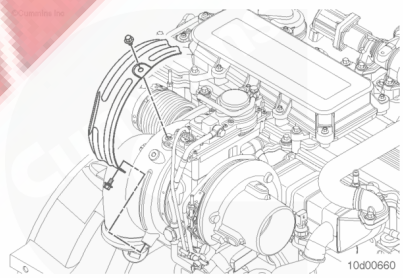
Install

Place a light coating of high-temperature anti-seize compound, Part Number 3824732, or equivalent, on the retaining capscrews prior to installation.

Install the turbocharger heat shield.

Tighten the capscrews.

Torque Value: 25 n•m [221 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for loose components.

Additional Service Items

- No additional service items required.

General Information

The air intake connection adapter is the part in the air intake system directly downstream of the charge air cooler and directly upstream of the air intake connection. There can be various styles of the air intake connection adapter, and the engine being serviced may **not** have an air intake connection adapter as shown in this procedure, but the procedure steps remain the same, regardless of the style.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

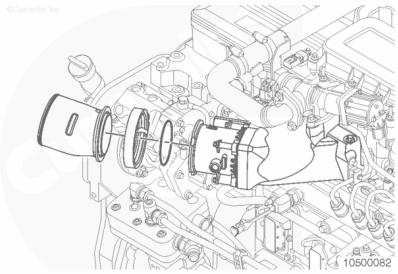
- Disconnect the batteries. See equipment manufacturer service information.
- Remove the charge air piping connected to the air intake connection adapter. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)

Remove

ANADOLU ISUZU AFTER SALES

Remove the V-Band clamp holding the air intake connection adapter to the engine intake throttle actuator.

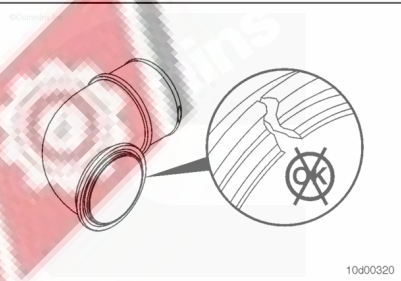
Remove the air intake connection adapter.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer's instructions before using.

⚠ WARNING ⚠

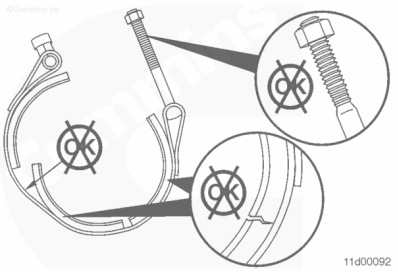
Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the air intake connection adapter. Use solvent. Dry with compressed air.

Inspect the air intake connection adapter for cracks, chips, or other damage.

Inspect the V-Band clamp for signs of stretching or damaged threads. Replace as necessary.

If the air intake connection adapter will **not** seal to the air intake connection or to the charge air piping, replace it.



ANADOLU ISUZU PARTS SALES

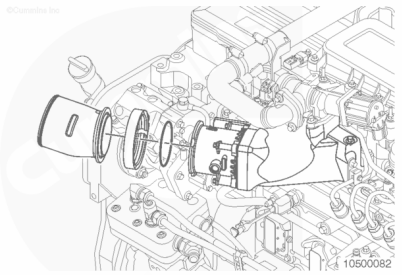
Install

The sealing o-ring **must not** be reused.

Install the air intake connection adapter, sealing o-ring, and V-Band clamp to the air intake connection.

Tighten the clamp.

Torque Value: 10 n•m [88 in-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the charge air piping connecting to the charge air cooler. Tighten the hose clamps. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for boost leaks.

Select Service Tools

Recommended Cummins® Service Tools

- Air Handling Clean Care Kit, Part Number 5298776

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

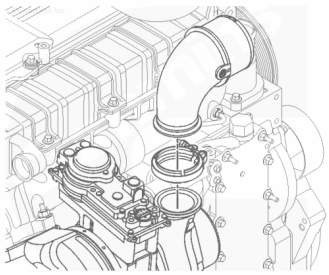
Note : Brush away all loose dirt from around the area of the air handling connections to avoid contamination of the interior of the engne.

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the charge air piping. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)

Remove

Remove the turbocharger outlet elbow, V-band clamp, and o-ring from the turbocharger compressor outlet.

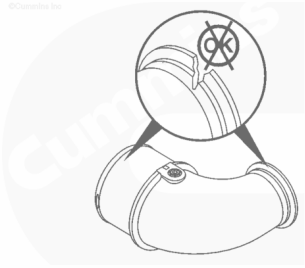
Use protective caps from Air Handling Clean Care Kit, Part Number 5298776, to cover both of the connection points.



Clean and Inspect for Reuse

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



10d00383

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

Clean the turbocharger compressor outlet connection. Use solvent. Dry with compressed air.

Inspect the turbocharger compressor outlet connection for cracks abnormal wear, other damage. Replace as necessary.

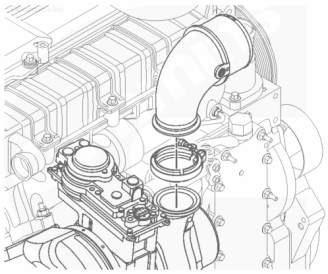
Discard the o-ring seal.

Install

Install the turbocharger compressor outlet elbow, V-band clamp, and new o-ring seal on the turbocharger compressor discharge outlet.

Make sure to remove the protective caps.

Tighten the clamp.



10d00342

Torque Value: 8 n•m [71 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

ANADOLU ISUZU AFTER SALES

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Air Handling Clean Care Kit, Part Number 5298776
- Turbocharger Actuator Inspect Gauge Kit, Part Number 4919281

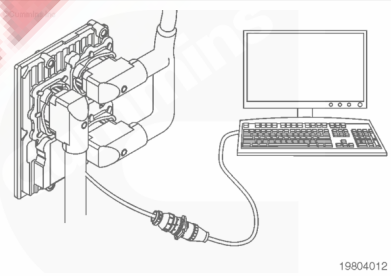
Additional Service Items

- No additional service items required.

General Information

⚠ CAUTION ⚠

The starting motor wiring could electrically interfere with the variable geometry turbocharger (VGT) wiring harness. The starting motor wiring must be at least 300 mm [12 in] away from the actuator and harness.



This procedure provides service information for the electronically controlled variable geometry turbocharger actuator. Take careful note of the procedure steps to avoid improper installation of the turbocharger actuator. Installation or replacement of the actuator requires the use of INSITE™ electronic service tool.

Preparatory Steps

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

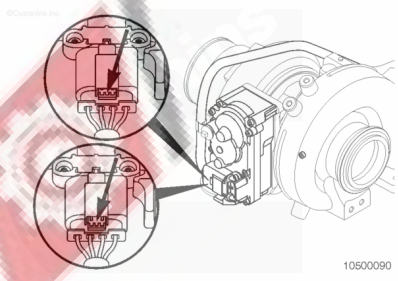
Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Clean the area around the turbocharger actuator. Dry with compressed air.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the turbocharger coolant hoses. Refer to Procedure 010-041 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-041.html)

Remove

⚠ CAUTION ⚠

Make sure the coolant has been drained before the actuator is removed. If the coolant is not completely drained, the actuator can be damaged.

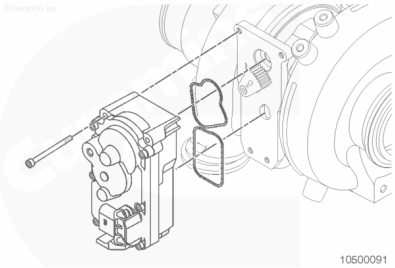


Disconnect the wiring harness from the turbocharger actuator by pushing down and out on the locking tab. The locking tab should click, indicating it is unlocked. Continue to push down and out on the locking tab while pulling the connector to remove it from the turbocharger actuator.

Remove the turbocharger actuator mounting capscrews. Discard the capscrews.

Remove the actuator.

Remove and discard the turbocharger actuator sealing gaskets.

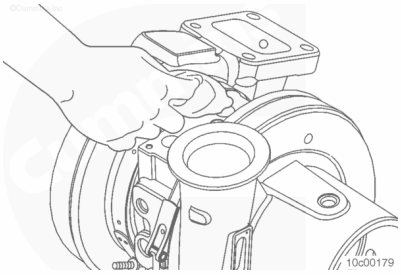


Clean and Inspect for Reuse

Install protective caps from Air Handling Clean Care Kit, Part Number 5298776, on all open connection points.

Use a clean cloth to wipe around the surface where the turbocharger actuator seals to the turbocharger.

Note : Take care **not** to drop any dirt or debris into the turbocharger.



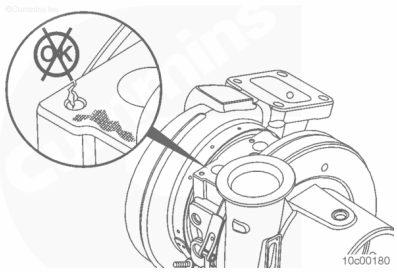
ANADOLU ISUZU AFTER SALES

Inspect the sealing surfaces and rubber sealing gasket for signs of leaks, cracks, or other damage.

If the sealing surface of the turbocharger is damaged and causing a leak, the turbocharger **must** be replaced. Do **not** continue with this procedure. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)

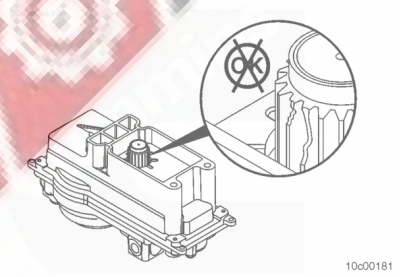
If the sealing surface of the actuator is causing a leak, replace **only** the actuator.

Note : It can be common to see oil leaking from around the sector gear shaft. This is **not** considered a malfunction or damage.



Inspect the pinion gear on the actuator for excessive wear or damaged teeth.

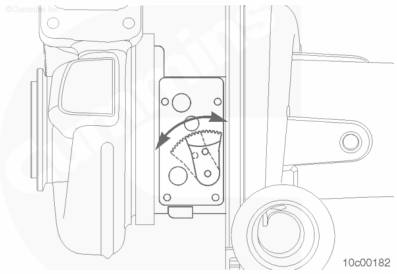
Replace the actuator if the pinion gear teeth are worn or damaged.



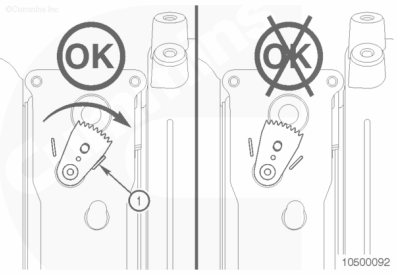
Inspect the sector gear on the turbocharger for excessive wear, damaged teeth, or a broken shaft.

Grasp the sector gear by hand. Move it through its operational range.

Note : It can take considerable force to move the sector gear. If it can be moved by hand, this is considered acceptable. Do **not** use any hand tools.

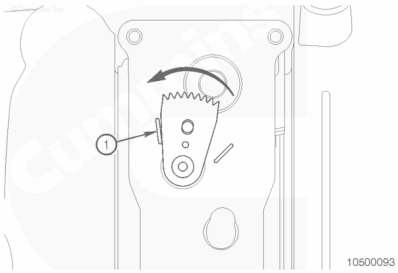


Rotate the sector gear **clockwise** (1) toward the turbocharger turbine housing. The edge of the sector gear **must** touch the engraved bearing housing hash mark.

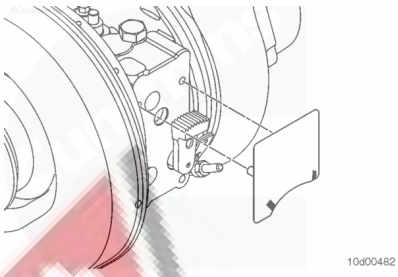


Rotate the sector gear **counterclockwise** (1) toward the turbocharger compressor housing. The edge of the sector gear **must** touch the engraved bearing housing hash mark.

If the sector gear does **not** go through its entire range of motion, or if the sector gear is seized, it is necessary to replace the entire turbocharger assembly. Do **not** continue with this procedure. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)



Alternately, the HE300Ve sector gear travel gauge from Turbocharger Actuator Inspection Gauge Kit, Part Number 4919281, can be used to check the sector gear for range of motion. To install the sector gear travel gauge, carefully bend the gauge and slide the thin section under the sector gear. If necessary, pull the sector gear out by hand to allow more clearance for the gauge. Verify the three alignment bosses are fully engaged in the bearing housing.



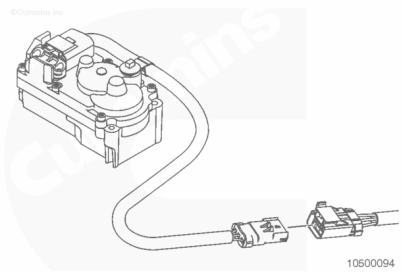
Install

Note : New turbocharger actuators are sold with a calibration code installed. Downloading a new calibration code into the turbocharger actuator should **only** be required if Fault Code 4956 or 4957 is active after installing a new turbocharger actuator, or if directed by a Campaign, Temporary Repair Practice, or warrantable repair.

If the turbocharger actuator requires a calibration code to be downloaded, use the following procedure. Refer to Procedure 010-150 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-150.html)

Note : Following these installation instructions in order is very important.

- Continue through the entire turbocharger actuator installation procedure before attempting to troubleshoot any other fault codes.
- Verify the turbocharger actuator is removed from the turbocharger bearing housing.
- Verify the turbocharger actuator electrical connector is disconnected from the engine wiring harness.
- Turn the keyswitch ON. Connect INSITE™ electronic service tool. Wait 60 seconds.



Note : It is important the keyswitch remain in the ON position throughout both the Install and Calibrate procedures unless otherwise directed.

- Connect the turbocharger actuator electrical connector to the engine wiring harness.

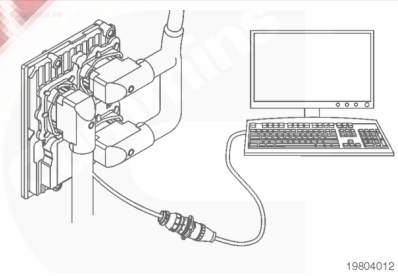
If Fault Code 2634 becomes active, disconnect the turbocharger actuator connector from the engine wiring harness with the keyswitch ON. Connect the turbocharger actuator electrical connector. Fault Code 2634 will go inactive.

It is normal and expected to have Fault Code 2449 active when a new turbocharger actuator is connected to the engine, because it is **not** calibrated to the turbocharger.

Continue through the engine turbocharger actuator installation procedure before attempting to troubleshoot any other fault codes.

In INSITE™ electronic service tool, go to the engine control module (ECM) Diagnostic Tests screen.

From the list, select VGT Electronic Actuator Installation and Calibration, and click on the “next” button.



Note : The VGT Electronic Actuator Installation and Calibration is **not** a diagnostic test. It is the procedure to properly install and calibrate the turbocharger actuator. Running this procedure improperly can result in additional fault codes and/or damage to the turbocharger or actuator.

INSITE™ electronic service tool “INSTALL ACTUATOR” command **must only** be run with the actuator **not** mounted to the turbocharger.

Locate the column labeled “Value” and left click on the down arrow. Select INSTALL ACTUATOR and select START.

Note : The pinion gear on the turbocharger actuator will **not** move during this step.

INSITE™ electronic service tool will indicate when this step is complete.

Fault Code 2449 will be active at this point in the procedure. Continue through the turbocharger actuator procedure before troubleshooting any fault codes.

If at any point, INSITE™ electronic service tool status message indicates the procedure was stopped or failed, leave the key ON and cycle the power to the actuator by

disconnecting it from the harness and reconnecting.

If cycling power to the actuator does **not** work, unplug the actuator, turn the keyswitch OFF for 30 seconds, and restart INSITE™ electronic service tool. Then start over, beginning with the actuator “INSTALL” step.

Rotate the sector gear **clockwise** by hand toward the turbocharger turbine housing. Make sure the edge of the sector gear is rotated all the way toward the hash mark on the bearing housing. Do **not** move the sector gear after this point.

Coat the teeth on the sector gear with the high-temperature grease packet supplied in the installation kit.

Note : It is critical for smooth reliable operation of the actuator to use the full amount of the Holset® supplied high-temperature grease.

⚠ CAUTION ⚠

Do not attempt to force the actuator onto the bearing housing by using the capscrews. Misalignment can cause damage to the actuator or turbocharger.

Install two new sealing o-rings on the turbocharger actuator. Make sure to use the new capscrews available in the Turbocharger Actuator Mounting Kit.

Insert the threaded guide pins into the diagonally opposite fastener holes in the bearing housing. Locate the actuator onto the guide pins. Slide the actuator into position, making sure the gear spigot and shroud locate into the mating holes in the bearing housing face. Insert the long and short actuator socket head capscrews in the remaining fastener holes. Hand tighten.

The actuator pinion gear and turbocharger sector gear **must** engage smoothly. If they do **not** engage smoothly, verify the sector gear through-hole and bearing housing blind hole are aligned.

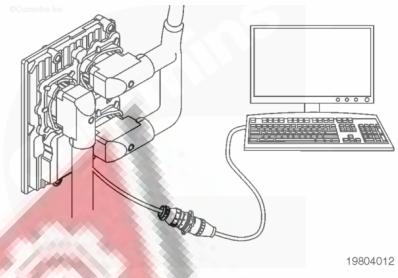
With the actuator aligned on the bearing housing, replace the guide pins with the actuator capscrews. Install the remaining two capscrews.

Tighten the four capscrews in a criss-cross pattern in two steps.

Torque Value:

1. 3 n•m [27 in-lb]
2. 11 n•m [97 in-lb]

Calibrate



The turbocharger actuator **must** be calibrated to the turbocharger. This step **must** be performed to make sure of proper turbocharger operation.

In INSITE™ electronic service tool screen labeled “VGT Electric Actuator Install and Calibrate”, locate the column labeled “Value” and left click on the down arrow. Select “CALIBRATE ACTUATOR”.

The INSITE™ electronic service tool “CALIBRATE ACTUATOR” command **must only** be run with the actuator mounted to the turbocharger.

Follow the instructions on the screen to calibrate the turbocharger actuator to the turbocharger. INSITE™ electronic service tool will indicate when this step is complete.

If INSITE™ electronic service tool status message indicates the procedure was stopped or failed, turn the keyswitch OFF for 30 seconds, then turn the keyswitch ON. Then start over, beginning with the “INSTALL ACTUATOR” instructions.

If the “CALIBRATE ACTUATOR” step does **not** pass, restart with the Install section.

It is normal to have an active Fault Code 2387 at this point.

Turn the keyswitch to the OFF position for 30 seconds. Turn the keyswitch ON. Refresh the fault code screen. All turbocharger actuator fault codes should be inactive. Use INSITE™ electronic service tool to clear all fault codes.

Make sure all turbocharger fault codes are inactive and cleared before adding coolant to the engine.

Finishing Steps

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Install the turbocharger coolant hoses. Refer to Procedure 010-041 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-041.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- If a malfunction resulted in coolant, oil, excessive fuel, or excessive black smoke entering the exhaust system, the aftertreatment system **must** be inspected. Refer to Procedure 014-015 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-015.html)
- Operate the engine to make sure the turbocharger actuator operates correctly and all turbocharger actuator fault codes are inactive.
- Check the engine for leaks.

⚠ CAUTION ⚠

The starting motor wiring can electrically interfere with the VGT pigtail and wiring harness. The starting motor wiring must be at least 300 mm [12 in] away from the actuator and harness.

If zip ties were removed, zip tie the turbocharger actuator and turbocharger speed sensor harnesses to the the oil drain line. The harnesses **must** route over the top of the compressor cover in between the bearing housing and compressor cover.

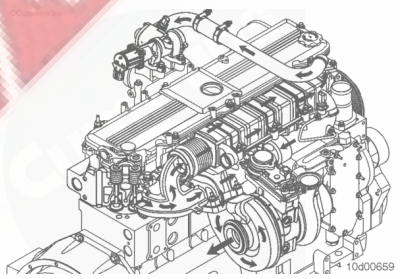
General Information



This engine uses exhaust gas recirculation (EGR) in the intake air system. Every component of the EGR system (EGR cooler, air transfer tube, etc.) up to the EGR connection is considered part of the exhaust system. Use the following procedure for exhaust system diagnostics. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)

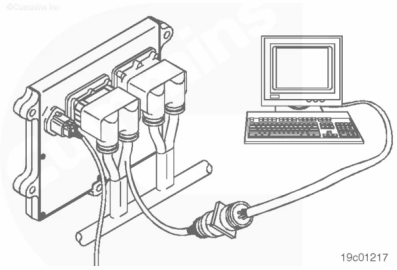
Before diagnostics of the air intake system begins, there are a few items that should be checked:

- Check for fault codes. See the appropriate troubleshooting trees.
- Make sure all intake pipe couplers are connected properly.
- Inspect the intake piping for any physical damage or cracks.
- Inspect the engine air filter for inlet restriction, contamination, or other damage. See equipment manufacturer service information.

This procedure lists various symptoms and respective components to check, listed in the order of easy to difficult to inspect. If the are no clear symptoms, or more than one, follow the diagnostics, in order, until the complaint has been resolved.

Note : The exhaust system components are covered in the Exhaust Systems - Overview. Refer to Procedure 011-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-011-999.html)

Make sure the turbocharger compressor intake and intake manifold temperature and pressure sensors are working properly. Use the following procedures for functionality checks for the intake manifold pressure/temperature sensor. Refer to Procedure 019-159 in Section 19 (/qs3/pubsys2/xml/en/procedures/425/425-019-159.html)



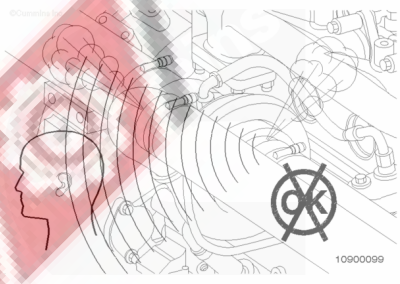
Use the following procedures for functionality checks for the turbocharger compressor intake pressure/temperature sensor. Refer to Procedure 019-466 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-466.html)

Leaks in the air system intake and/or exhaust components can produce excessive engine noise.

A leaking noise usually sounds like a high-pitched whining or sucking.

Check for leaks in the intake and exhaust system.

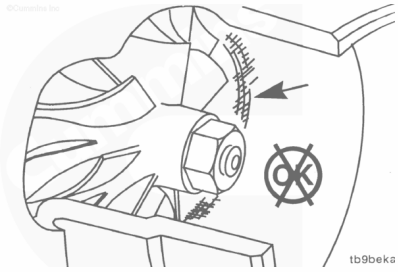
Check to make sure all hose clamps are tight. Refer to Procedure 010-024 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-024.html)



Malfunctioning Turbocharger

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer’s instructions before using.

⚠ WARNING ⚠

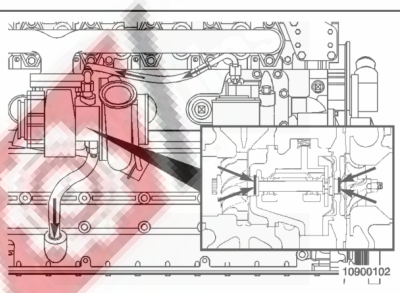
Use skin and eye protection when handling caustic solutions to reduce the possibility of personal injury.

The malfunction of the internal components of the turbocharger can reduce its effectiveness. A bearing malfunction can produce friction, which will slow the speed of

the rotor assembly. Worn bearings can also allow the blades of the rotor assembly to rub the housing, reducing the rotor assembly speed.

Lower pitched sounds or rattles, at slower engine speeds, can indicate debris is in the system or the rotor assembly is touching the housings. If there is a complaint for noise, low power, engine response, or oil consumption, verify the conditions under which the complaint occurred. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)

Seal rings are used on each end of the rotor assembly. The primary function of the seals is to prevent exhaust gases and compressed air from entering the turbocharger housing. Lubricating oil leakage from the seals is rare, but it can occur.

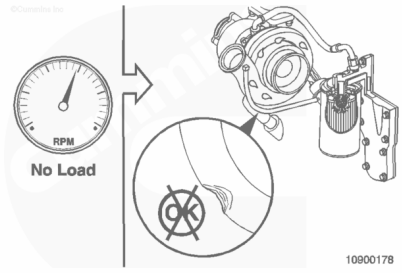


Note : Excessive crankcase pressure will **not** allow the oil to drain from the turbocharger. This will load the bearing housing and allow lubricating oil to leak past the seal rings and into the intake and exhaust of the engine.

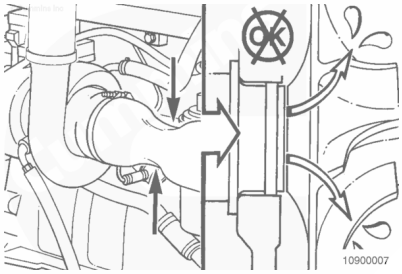
If turbine seal leakage into the exhaust occurs on engines with an aftertreatment system, the aftertreatement system **must** be inspected for reuse.

Note : If the engine experiences a turbocharger malfunction or any other occasion in which oil or debris is put into the charge air system, the EGR differential pressure sensor flow ports **must** be cleaned.

A restricted or damaged lubricating oil return line will cause the turbocharger housing to be pressurized, causing lubricating oil to migrate past the seal rings on both the intake and exhaust side of the turbocharger.



Additionally, high intake or exhaust restrictions can cause a vacuum between the compressor and turbocharger housing, resulting in lubricating oil leaking past the seal rings at the compressor (intake) side.



Note : If this occurs, it is necessary to flush the charge air cooler to clean the oil from the intake system. Refer to Procedure 010-023 in Section 10.

(/qs3/pubsys2/xml/en/procedures/425/425-010-023.html) Refer to Procedure 010-027 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-027.html)

Note : The EGR differential pressure sensor flow ports **must** be cleaned. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)

Turbocharger Noise

It is normal for the turbocharger to emit a whining sound that varies in intensity, depending on turbine wheel speed.

The sound is caused by the very high rotational speed of the rotor assembly and the method used to balance the rotor assembly during manufacturing.

Because the engine uses a variable geometry turbocharger, which allows for control of the turbine wheel speed independent of engine load and speed, the sound may **not** be the loudest at rated engine speed and load.

Depending on engine and aftertreatment requirements for exhaust temperatures and exhaust pressure, the sound can be most noticeable around idle speed conditions or slightly above.

Charge Air Cooled Engines

The charge air cooler makes sure the proper intake air density is achieved. External damage to the fins or excessive restriction or pressure losses can affect its performance and reduce engine performance.

Use the following procedure for inspection of the charge air cooler. Refer to Procedure 010-027 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-027.html)

Note : The long-term integrity of the charge air cooling system is the responsibility of the vehicle and component manufacturers.

Air Intake System

On equipped engines, the intake throttle actuator facilitates EGR flow through an electronically actuated valve. It is attached forward of the air intake manifold.

Inspect the intake throttle actuator. Refer to Procedure 010-139 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-139.html)

Note : The style of the air intake connection (1) can vary, depending on the application. Although the air intake connection can appear different, the function is the same.

The air intake connection is a critical component in combining the EGR flow and fresh intake air of the engine.

The EGR valve (2) is mounted to the top of the air intake connection.

The purpose of the EGR valve is to control the amount of EGR flow into the air intake connection.

The amount of EGR flow is calculated by measuring the pressure differential across the exhaust gas entrance port in the air intake connection, just below the EGR valve outlet. A pressure differential sensor (3) mounted on top of the intake connection, reads the pressure on each side of the exhaust gas entrance port through internal drillings in the air intake connection.

Soot in the exhaust gas entrance ports can affect the pressure readings which, in turn, will affect the calculated EGR flow and can result in an improper commanded EGR valve position. The air intake connection also acts as the intake air source for engines equipped with turbocharged air compressors. An air compressor inlet tube connects the air compressor to the air intake connection.

Inspect and clean the intake air connection if necessary. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)

Use the following procedure for troubleshooting the exhaust system diagnostics related to the EGR system. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)

Air Intake Manifold/Cold Starting Aid

The ON/OFF operation of the intake air heater is controlled by the engine control module (ECM).

The ECM controls a single original equipment manufacturer (OEM) supplied relay which provides power for the intake air heater when commanded. A symptom of a malfunctioning cold starting aid is a hard start in cold ambient temperatures and/or white smoke on engine startup. A plugged intake air heater element can also result in low power.

Use the following procedure for verifying the cold starting aid function. Refer to Procedure 010-029 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-029.html)

Note : The cold starting aid is **not** a serviceable part. If the cold starting aid has cracked, broken, or melted elements, the engine air intake manifold **must** be replaced. Refer to Procedure 010-023 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-023.html)

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

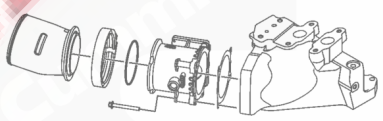
Additional Service Items

- No additional service items required.

General Information

The engine intake throttle actuator connects in between the following components:

- Air intake connection adapter by a o-ring and V-band clamp
- Intake connection by four capscrews and a gasket.



10500083

An electronic actuator controls the movement of the throttle plate. The position of the engine intake throttle actuator moves between fully open (100 percent) and fully closed (0 percent). When the engine is keyed OFF (power OFF) or keyed ON with zero engine rpm, the engine intake throttle actuator will be fully open. When the engine is started, the engine intake throttle actuator will move to 90 percent open. While the engine is running, the engine intake throttle actuator should never be fully open (100 percent). This can be confirmed using INSITE™ electronic service tool.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

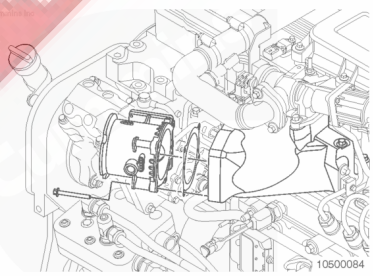
Electrical operation of the throttle actuator is only permitted via the engine control module. The application of a DC voltage directly to the engine intake throttle actuator will result in serious damage to the actuator.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the charge air piping from the air intake connection adapter. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Remove the air intake connection adapter. Refer to Procedure 010-131 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-131.html)

Remove

Disconnect the electrical connector at the engine intake throttle actuator.

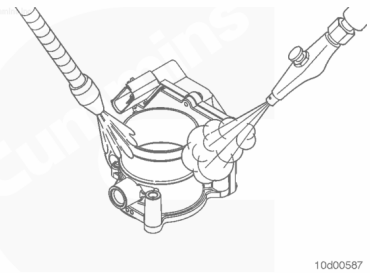
Remove the capscrews that secure the engine intake throttle actuator to the air intake connection.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

Quick or forceful movements of the throttle plate by hand can result in damage to the mechanism.

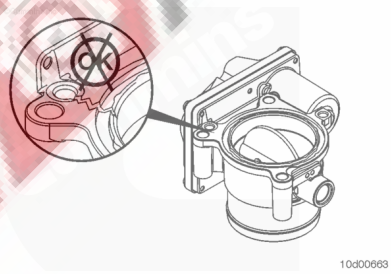
Note : The engine intake throttle actuator is **not** repairable and should **not** be disassembled.

Carefully clean the air intake connector adapter and engine intake throttle actuator. Use warm, soapy water or an acetone free solvent. Do **not** immerse.

Carefully dry with compressed air.

Note : Solvents containing acetone can damage the seals in the engine intake throttle actuator. Avoid these types of solvents.

Inspect the engine intake throttle actuator connection sealing surfaces for cracks and other damage.



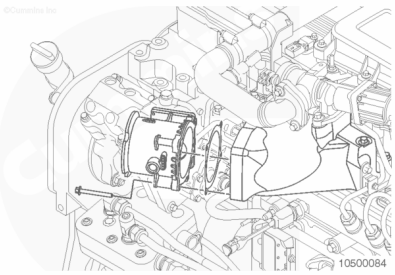
Install

Note : The face of the engine intake throttle actuator gasket can be installed in either direction.

Replace the gasket. Install the engine intake throttle actuator to the air intake connection. Use a crisscross pattern when tightening the capscrews.

Torque Value: 10 n•m [89 in-lb]

Connect the electrical connector at the engine intake throttle actuator.



Finishing Steps

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Air Handling Clean Care Kit, Part Number 5298776

Additional Service Items

- No additional service items required.

General Information

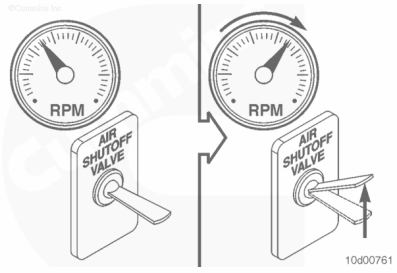
The air shutoff valve activates when excessive engine speed is detected. It results in immediate engine shutdown. This feature was specifically developed for engines that operate in environments where combustible gases can be present in the intake air. In such environments, stopping the flow of fuel to the engine does **not** guarantee the engine will stop. The intake air shutoff valve will stop the engine when necessary.

The air shutoff valve can also be actuated by the test switch or manual switch. The air shutoff lamp will illuminate when the valve is actuated.

Preparatory Steps

⚠ WARNING ⚠

Make sure the valve is in the closed position before removal to reduce the possibility of personal injury.



Note : Activate the air shutoff valve before service to make sure it is in the closed position.

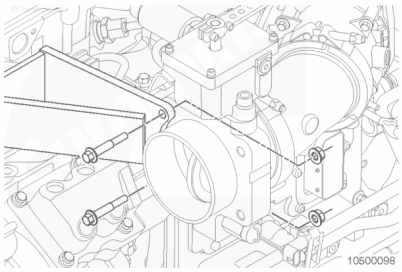
- Disconnect the charge air piping connected to the air shutoff valve. See equipment manufacturer service information.

Remove

Verify the keyswitch is in the OFF position.

Disconnect the solenoid and position switch electrical connectors from the air shutoff valve.

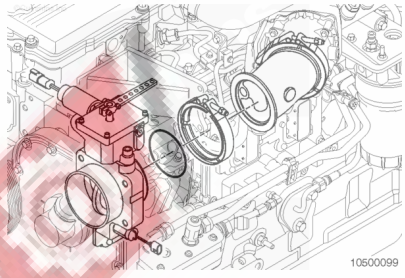
Remove the air shutoff valve support bracket from the shutoff valve, if applicable.



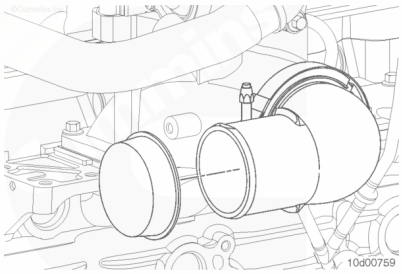
Make sure to completely loosen the V-band clamp from the charge air piping. Make sure to support the valve while loosening.

Remove the clamp, o-ring, and shutoff valve from the air intake connection adapter pipe.

The sealing o-ring **must not** be reused. Discard the sealing o-ring.



Cover the intake connection adapter pipe. Use Air Handling Clean Care Kit, Part Number 5298776.



Inspect for Reuse

Inspect the air shutoff valve for cracks or other damage.

Replace the air shutoff valve, if necessary.

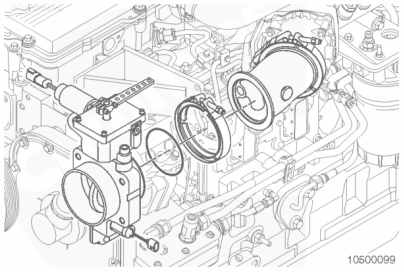
Inspect the seal around the disc valve for cracks or other damage. If the seal is **not** within the groove in the disc valve or other damage is found the air shutoff valve **must** be replaced.

Note : The air shutoff valve is **not** repairable and should **not** be disassembled.

ANADOLU ISUZU AFTER SALES

Install

Install the air shutoff valve and new o-ring onto the intake connection adpater pipe. Orient the valve with the reset lever toward the rear of the engine.

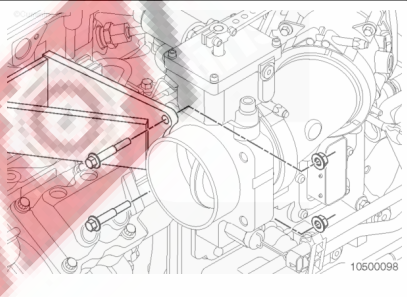


Connect the charge air piping onto the shutoff valve. Make sure to support the valve and align it as such that the valve will **not** contact any original equipment manufacturer (OEM) components.

Tighten the V-Band clamps.

Torque Value: 10 n•m [89 in-lb]

Install the air shutoff valve support bracket, if applicable.



Torque Value:
Support Bracket Capscrew 47 n•m [35 ft-lb]

Torque Value:
Support Bracket Nut 20 n•m [177 in-lb]

Connect the solenoid and position switch electrical connectors to the air shutoff valve.

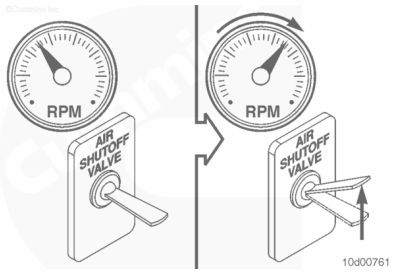
ANADOLU ISUZU AFTER SALES

Finishing Steps

- Install the charge air piping to the air shutoff valve. See equipment manufacturer service information.
- Reset the air shutoff valve.
- Operate the engine to check for leaks.

Test

Note : The starter will be locked out while the valve is actuated. The air shutoff valve **must** be reset to unlock the starter.



Move and hold the air shutoff valve test switch to the active position and apply the throttle to raise the engine rpm. The test switch must be held for the entire test.

The air shutoff valve is functioning properly if the engine shuts down.After the air shutoff valve activates, turn the keyswitch to the OFF position. Manually push the reset lever by hand to reset the valve. **Only** hand pressure should be used to reset the valve.

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

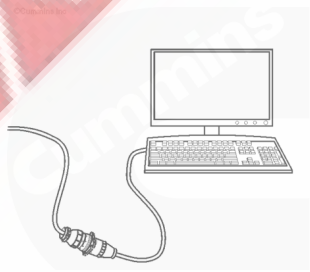
- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

General Information

Note : Downloading a calibration code into the turbocharger actuator is **only** required if directed by a Campaign, Temporary Repair Practice, or warrantable repair.



Turbocharger actuator calibration code downloads can be performed with INSITE™ electronic service tool.

INSITE™ electronic service tool connects to the turbocharger actuator through the engine control module (ECM) by using the J1939 data link.

The turbocharger actuator calibration code download can be performed with the actuator installed or removed from the turbocharger when installing a new actuator. If performing a calibration code download into an existing actuator, do **not** remove the actuator.

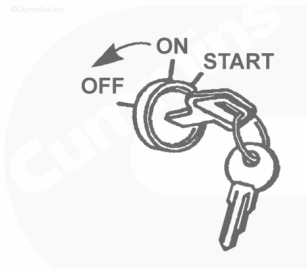
The "Install" and "Calibrate" sections **must** be performed after the calibration code download process if the actuator is not yet installed onto the turbocharger. Refer to Procedure 010-134 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html)

If the turbocharger actuator is **not** removed during the calibration code download, no further steps are required.

Initial Check

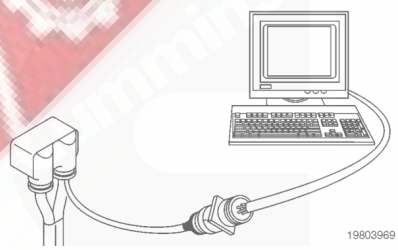
The turbocharger actuator calibration code download process occurs with the keyswitch turned ON. **Always** follow the instructions on the service tool screens.

Note : If the tool will **not** communicate with the keyswitch in the ON position, cycle the keyswitch and try again.



Install

Note : Although either the engine-mounted service tool connector or the vehicle-mounted service tool connector can be used for the software installation, Cummins Inc. recommends the engine-mounted service tool connector be used for the software installation process whenever possible.



- Connect INSITE™ electronic service tool.
- Select Advanced ECM Data, select Turbocharger Actuator Compatibility; locate and record turbocharger actuator software part number and hardware part numbers.
- Disconnect INSITE™ electronic service tool.
- Within Calibration Selection menu, use ECM/PDD Code search, enter software part number without first 0000 (four digits if 0).
- Download turbocharger actuator calibration code to Calibration Workspace.
- Connect INSITE™ electronic service tool.
- Select ECM/PDD calibration tab; select Calibration Workspace, select PDD folder, select turbocharger actuator controller, locate recorded device part number for installed variable geometry turbocharger (VGT).
- Install recorded turbocharger actuator calibration software part number.
- During install process INSITE™ electronic service tool automatically disconnects from ECM.
- When complete, INSITE™ electronic service tool will automatically reconnect.
- New actuator calibration code is **not** stored until a key off event occurs.
- Turn keyswitch to Off position to power down ECM.

If the turbocharger actuator is removed from the engine during the calibration code download, the “Install” and “Calibrate Turbocharger Actuator to Turbocharger” steps **must** be performed.

Refer to Procedure 010-134 in Section 10 (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html). If the turbocharger actuator is **not** removed during the calibration code download, no further steps are required.

Finishing Steps

Note : If the connection is lost during the download process, it can result in Fault Code 2636. If this occurs, the turbocharger actuator calibration process **must** be performed a second time to clear Fault Code 2636.

- See the Help Section of INSITE™ electronic service tool for detailed turbocharger actuator calibration code download procedures.
- If necessary, complete the (VGT) actuator installation. Refer to Procedure 010-134 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html)
- Use INSITE™ electronic service tool to clear all inactive fault codes.

ANADOLU ISUZU AFTER SALES

Last Modified: 06-Aug-2018

Select Service Tools

Recommended Cummins® Service Tools

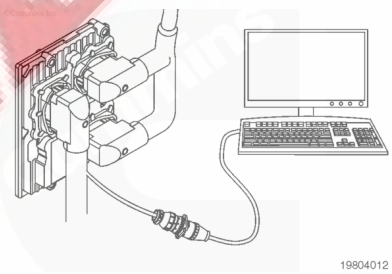
- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

General Information

Conditions necessary to perform the Variable Geometry Turbocharger Hysteresis Test:



- Engine OFF
- Keyswitch ON
- Turbocharger and actuator installed on engine
- Coolant temperature greater than 10°C [50°F]
- Battery voltage greater than 11.5 VDC
- No active turbocharger fault codes
- INSITE™ electronic service tool connected
- Compare the engine control module (ECM) code and revision number in the ECM to the calibration revision listed in the ECM calibration revision history for applicable changes related to the “Variable Geometry Turbocharger Hysteresis Test”. If the ECM does **not** contain this revision or higher, calibrate the ECM. Refer to Procedure 019-032 in Section 19. (/qs3/pubsys2/xml/en/procedures/105/105-019-032.html)

The INSITE™ electronic service tool “Variable Geometry Turbocharger Hysteresis Test” **must only** be performed with the actuator mounted to the turbocharger.

In INSITE™ electronic service tool screen labeled “Variable Geometry Turbocharger Hysteresis Test”, locate the button labeled “Start”.

Follow the instructions on the screen to test the turbocharger. INSITE™ electronic service tool will indicate when the test has completed.

If INSITE™ electronic service tool status message indicates the procedure was stopped or had an error, turn the keyswitch OFF for 30 seconds, then turn the keyswitch ON. Verify that all conditions above are met. Perform the test again.

If the “Variable Geometry Turbocharger Hysteresis Test” results in an output of “Fail”, the turbocharger is **not** reusable. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)

Rerun the “Variable Geometry Turbocharger Hysteresis Test” after replacing the turbocharger to confirm the root cause of the issue.

If the “Variable Geometry Turbocharger Hysteresis Test” results in an output of “Fail”, the actuator is **not** reusable. Refer to Procedure 010-134 (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html) in Section 10.

If the “Variable Geometry Turbocharger Hysteresis Test” results in an output of “Pass”, this indicates the sector gear movement is acceptable and the actuator should **not** be removed.

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® service tools required.

Additional Service Items

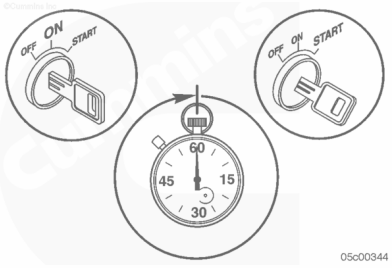
- No additional service items required.

General Information

If the aftertreatment diesel exhaust fluid (DEF) dosing system has been serviced or repaired, it will be necessary to prime the DEF dosing system, in order to check for proper operation.

Setup

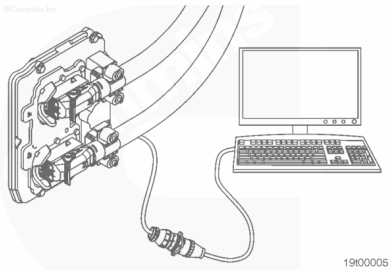
Note : It can be necessary to allow the aftertreatment system time to cool, to allow for accessibility to check for leaking components.



- Make sure the DEF tank is full of DEF. See equipment manufacturer service information.
- Make sure the DEF is **not** frozen. If the DEF is frozen, it will be necessary to run the engine to allow the system to thaw.
- Make sure all DEF dosing system lines are properly connected to the DEF tank, DEF dosing unit, and DEF dosing valve. See equipment manufacturer service information.
- Connect INSITE™ electronic service tool.

Prime

With the keyswitch ON and the engine **not** running, select the Aftertreatment Diesel Exhaust Fluid System Leak Test found under the ECM diagnostics test menu in INSITE™ electronic service tool.



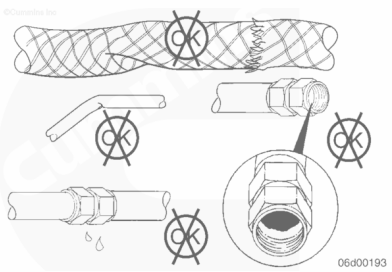
This test will cause the DEF dosing unit to draw DEF from the tank and pressurize it in the DEF dosing valve supply line. During this test, the dosing unit will continuously run and all unused DEF will return to the tank. An audible pumping noise will be noticeable during the test.

During the initialization of this test, a note will pop up on the screen, indicating the system has reached a prime state.

When the test is started, the dosing system will prime. During this process the aftertreatment DEF dosing valve will be held in the closed position. As a result, DEF droplets can potentially be observed exiting the tip of the dosing valve. This is a normal operating characteristic. Do **not** remove the injector.

Inspect

Note : If the system is unable to prime due to leaks, it will be necessary to turn the keyswitch OFF in order to stop the dosing unit. The dosing unit can **not** be stopped using INSITE™ electronic service tool.

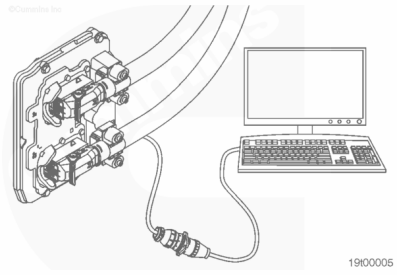


While the test is running, inspect all DEF lines, fittings, and connections for external leaks. Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html) Refer to Procedure 011-059 in Section 11 (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html). See equipment manufacturer service information.

Repair and replace any leaking component(s). Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html) Refer to Procedure 011-059 in Section 11 (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html). See equipment manufacturer service information.

Note : If the system fails to prime, a key cycle will be required before attempting to run the aftertreatment DEF system leak test again.

Note : The aftertreatment DEF system leak test can **only** be attempted twice consecutively. A key cycle will be required before attempting to run the aftertreatment DEF system leak test again after two attempts.



If the system is able to successfully prime, a pop-up message will appear in INSITE™ electronic service tool to notify the technician.

Upon completion of inspecting the lines, fittings, and connections for leaks, press the STOP button in INSITE™ electronic service tool. The dosing unit will then purge the system of DEF. An audible purging noise will be noticeable.

If the test is **not** STOPPED using INSITE™ electronic service tool, it will continue to pump for 20 minutes and then automatically purge the system of DEF.

If the system can **not** build pressure, it will attempt to prime multiple times before flagging a fault code.

If any fault codes occur while running this test, see the appropriate fault code troubleshooting tree.

Finishing Steps

- During the test, a small quantity of DEF is sprayed into the aftertreatment decomposition tube. After completion of the test, it is necessary to run the engine at high idle for 5 minutes in order to prevent DEF deposits from forming in the aftertreatment decomposition tube.
- Check for fault codes.

General Information

The exhaust manifold contains a seal in the slip joint between the two pieces of the exhaust manifold. If the exhaust manifold slip joint does **not** appear to be leaking, there is no need to inspect the seal or separate the exhaust manifold. The exhaust manifold seal requires a special tool in the event of replacement. The seal is reusable if it passes the inspection criteria.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

Note : Brush away all dirt from around the area of the air handling connections to avoid contamination of the interior of the engine.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the air crossover tube and charge-air cooler hose. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Remove the exhaust gas recirculation (EGR) cooler vent line. Refer to Procedure 008-017 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-017.html)
- Remove the turbocharger, if used. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)
- Remove the EGR cooler coolant lines. Refer to Procedure 011-031 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-031.html)
- Remove the exhaust gas pressure sensor tube. Refer to Procedure 011-027 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-027.html)
- Remove the EGR connection tubes. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Remove the EGR cooler. Refer to Procedure 011-019 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-019.html)

Remove

GRAPHIC NOT FOUND

Note : The two sections of the exhaust manifold are sealed by an exhaust manifold seal. If preliminary inspection shows the seal is **not** leaking, it is **not** necessary to separate the two parts of the exhaust manifold.

Remove the twelve capscrews from the exhaust manifold. Remove the exhaust manifold.

Remove the gasket from the exhaust manifold to the EGR cooler inlet connection.

Use heavy tape to cover open points in the exhaust manifold and cylinder head.

Disassemble

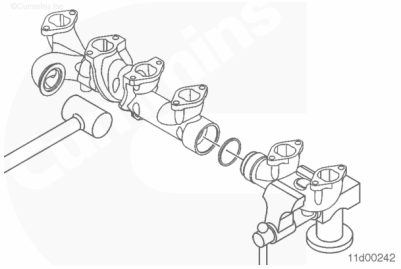
Use a vise to clamp on the two-port section of the exhaust manifold.

Do **not** allow the jaws of the vise to contact the exhaust manifold sealing surfaces.

Use a soft-faced mallet to lightly tap on the four-port section of the exhaust manifold to separate it from the two-port section of the exhaust manifold.

Use heavy tape to cover open points in the exhaust manifold and cylinder head.

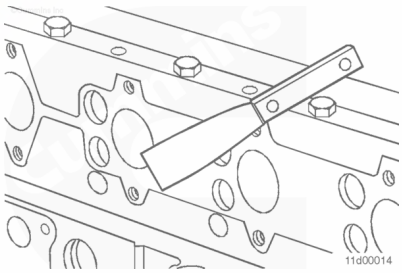
Note : If the exhaust manifold will **not** separate, it can be necessary to heat the manifold in the slip joint area to allow for separation of the manifold.



Clean and Inspect for Reuse

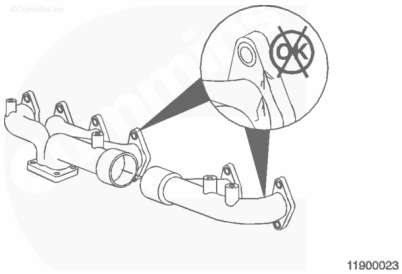
Clean the sealing surfaces of the cylinder head and the exhaust manifold. Use a gasket scraper or a wire brush.

Take caution to keep debris out of the cylinder head.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



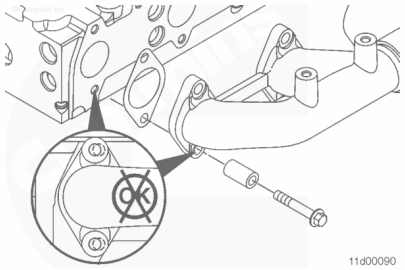
⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

Clean the exhaust manifold. Use steam. Dry with compressed air.

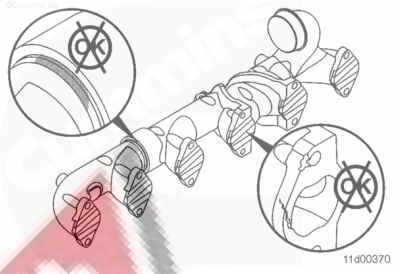
ANADOLU ISUZU DEALER SALES

If a missing or broken capscrew is found check the manifold to cylinder head fit. Perform this inspection on the larger four port section of the manifold. If the manifold mounting capscrew holes do **not** line up with the tapped holes in the cylinder head, replace both pieces of the exhaust manifold.



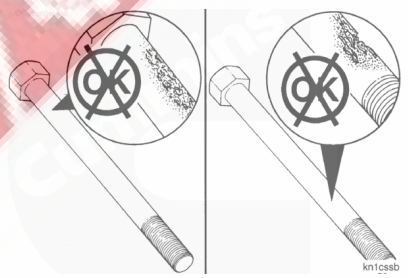
Inspect the exhaust manifold for cracks, soot streaking, leaks, and burnout.

Inspect the cylinder head bosses and turbocharger mounting studs for damage. Repair or replace, as necessary.



Inspect the exhaust manifold capscrews for corrosion.

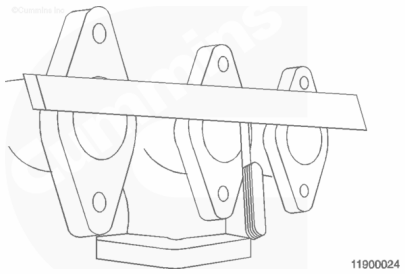
Replace the capscrews if corrosion is found.



Measure the manifold surface for flatness. Place a ruler over all exhaust ports in the manifold. Measure the gap between the port surface and the ruler. Use a feeler gauge.

Exhaust Manifold Flatness		
mm		in
0.20	MAX	0.008

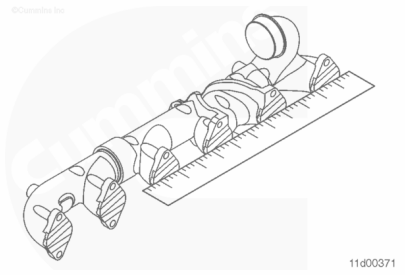
If any port measures out of specification, replace the manifold.



Measure the manifold surface for flatness. Place a ruler over all exhaust ports in the manifold. Measure the gap between the port surface and the ruler. Use a feeler gauge.

Exhaust Manifold Flatness		
mm		in
0.20	MAX	0.008

If any port measures out of specification, replace the manifold.



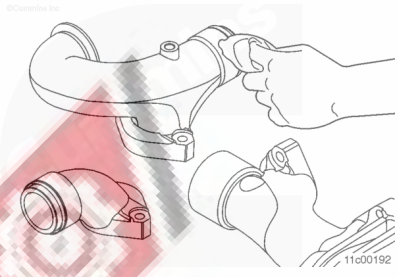
ANADOLU ISUZU GENUINE PARTS

Note : For multi-piece manifolds, each section **must** be verified to be flat, independently. If either section is found to be out of specification, replace both sections of the manifold.

The assembled two-piece manifold is **not** required to meet the flatness specification of the one piece manifold, as some misalignment is allowed for in the design of the manifold. Some misalignment will be eliminated when the manifold capscrews are tightened to specification during installation.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

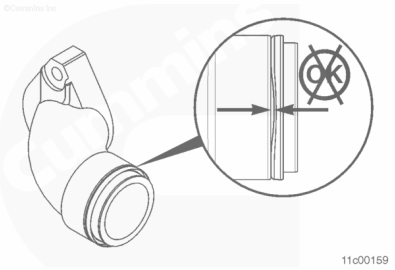


Clean the carbon from the exhaust manifold seal surfaces. Use a fine grit emery cloth.

Blow all debris from the exhaust manifold. Use compressed air.

Check that the exhaust seal ring is fully seated against the shoulder of the exhaust manifold male end section.

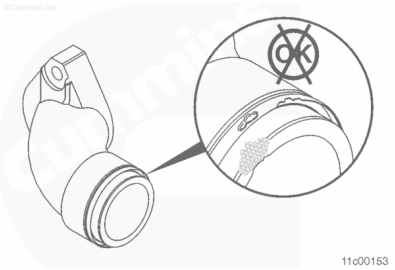
If the exhaust seal ring is **not** fully seated against the shoulder, the exhaust seal ring **must** be replaced.



Inspect the exhaust manifold seal bore for wear.

Inspect the exhaust seal ring for signs of damage or excessive wear.

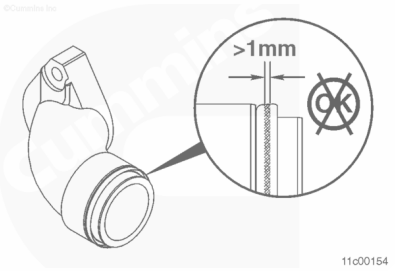
The exhaust seal ring **must not** show signs of denting or any other damage.



Measure the wear width on the exhaust seal ring.

The wear width **must not** be more than 1 mm [0.04 in] wide anywhere on the seal.

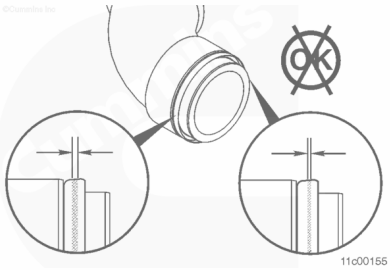
If the wear width is more than 1 mm [0.04 in] wide anywhere on the exhaust seal ring, it **must** be replaced.



ANADOLU ISUZU AFTER SALES

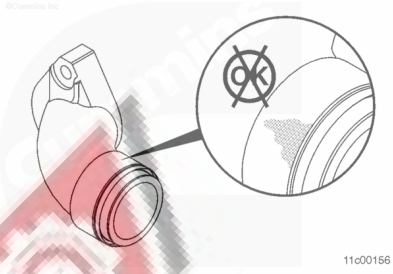
The wear width **must** be uniform around the seal ring.

If one side of the exhaust seal ring is worn more than the other, the exhaust seal ring **must** be replaced.



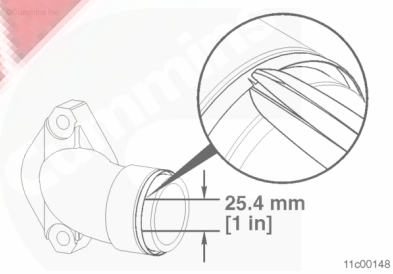
Inspect the exhaust manifold slip joint for signs of soot leakage.

If there is no evidence of an exhaust leak from the slip joint, and there are no visible cracks or other damage, do **not** remove the exhaust seal ring.



If there is damage, remove the exhaust seal ring by cutting it with a pair of snips and pulling it off with a pair of pliers.

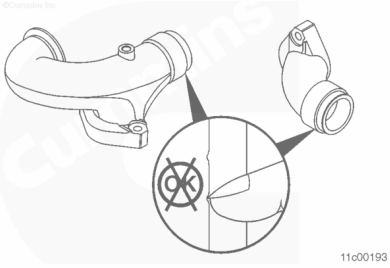
Discard the seal ring after removal.



Inspect the exhaust seal ring mating surfaces of the exhaust manifold.

If scratches or nicks can be felt with a fingernail on the exhaust seal ring mating surfaces, the exhaust manifold section **must** be replaced.

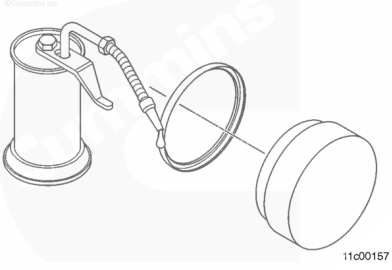
After completing inspection, recover the open points with heavy tape.



Assemble

Insert a new exhaust seal ring into seal installer, Part Number 4918709.

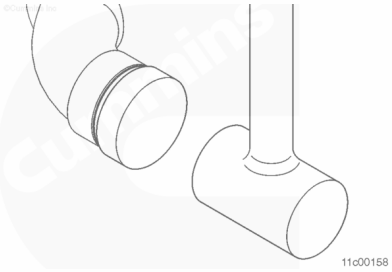
The seal is directional.



ANADOLU ISUZU PARTS SALES

Use a light coat of grease or clean engine oil to lubricate the exhaust seal ring during assembly onto the sections of the exhaust manifold.

With the two-port section of the exhaust manifold secured in a vise, lightly tap on the face of the service tool with a hammer until the exhaust seal ring is bottomed out against the shoulder of the joint.

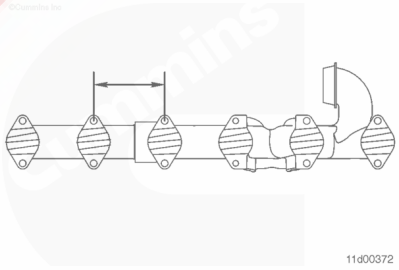


Check the seal to make sure it was **not** damaged during the installation process.

If the seal has bent edges, nicks, cuts, or other damage, remove it and start over.

Install

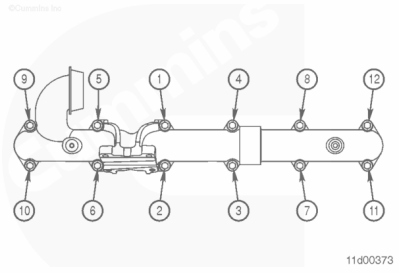
Measure the distance between the center of the mounting holes on ports 4 and 5 of the manifold.



If the distance is **not** within specification, put the manifold on a flat surface with the ports face down and lightly tap the manifold with a soft-faced mallet until the measurements are within specification.

Manifold Section Distance		
mm		in
136	MIN	5.35
138	MAX	5.43

Install the exhaust manifold to the cylinder head and EGR cooler inlet. Install new gaskets.



Lubricate the capscrews with high temperature anti-seize compound, Part Number 3824732, or equivalent, prior to installation.

Torque Value: 53 n•m [39 ft-lb]

Follow the tightening sequence as shown in the illustration.

Note : Using high temperature anti-seize compound is highly recommended. This provides consistent torque and pre-load and is a preventative measure against capscrew ceasing.

ANADOLU ISUZU PARTS

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the EGR cooler. Refer to Procedure 011-019 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-019.html)
- Install the EGR connection tubes. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Install the exhaust gas pressure sensor tube. Refer to Procedure 011-027 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-027.html)
- Install the EGR cooler coolant lines. Refer to Procedure 011-031 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-031.html)
- Install the turbocharger. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)
- Install the EGR cooler vent line. Refer to Procedure 008-017 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-017.html)
- Connect the charge air cooler hose and crossover tube. Refer to Procedure 010-019 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-019.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

ANADOLU FUEL

Select Service Tools

Recommended Cummins® Service Tools

- Pressure/vacuum adapter, Part Number 3164491
- Digital multimeter, Part Number 3164488, or deluxe digital multimeter, Part Number 3164489, or equivalent
- Adapter fitting, Part Number 4918576, or equivalent

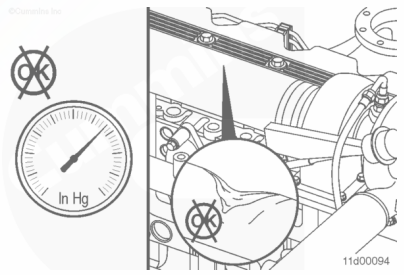
Additional Service Items

- No additional service items required.

General Information

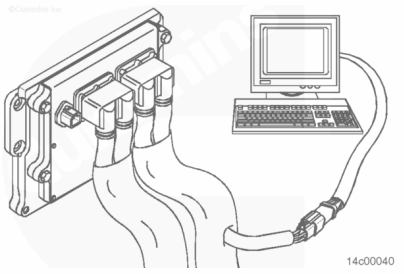
When measuring exhaust restriction, it is preferred the measurement point be within one pipe diameter of the turbocharger outlet.

If this requirement can **not** be met, make sure to inspect the exhaust outlet tubing between the turbocharger outlet and exhaust pressure tap location for damage to the exhaust piping.



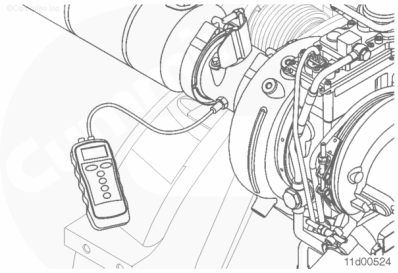
Initial Check

Use INSITE™ electronic service tool to check for fault codes. If any are present, follow the troubleshooting steps as outlined in the corresponding fault code troubleshooting procedure.



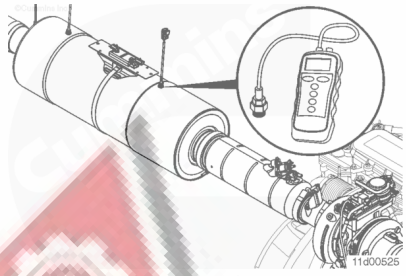
Measure

If equipped, remove the pipe plug from the pressure tap located in the turbocharger exhaust outlet tubing or the inlet of the aftertreament system.



Install pressure/vacuum adapter, Part Number 3164491, used with digital multimeter, Part Number 3164488, or deluxe digital multimeter, Part Number 3164489, or equivalent, into the pressure tap location.

If the exhaust outlet tubing or the inlet of the aftertreatment system is **not** equipped with a pressure taplocation, remove the first exhaust temperature sensor located in the aftertreatment system. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



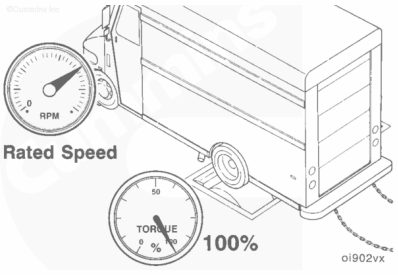
Install adapter fitting, Part Number 4918576, or equivalent, in the temperature sensor port. This will adapt the temperature sensor port to 1/8 inch NPT pipe threads.

Install pressure/vacuum adapter, Part Number 3164491, or equivalent, into the pressure tap location.

Use digital multimeter, Part Number 3164488, or deluxe digital multimeter, Part Number 3164489, or equivalent, to obtain the exhaust restriction measurement.

Note : Install at least 12 inches of metal tubing between the exhaust pipe pressure tap and pressure gauge to prevent exhaust from damaging the gauge and giving an inaccurate reading.

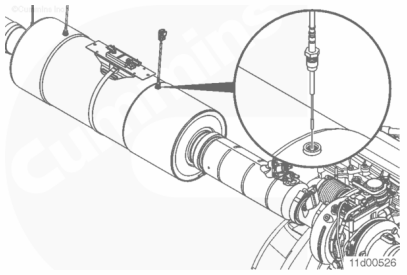
Operate the engine at rated speed and load and record the exhaust restriction. Refer to Procedure 018-020 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-020.html)



If the exhaust restriction exceeds the specification:

1. Inspect the exhaust piping for damage. See equipment manufacturer service information.
2. Check for any fault codes related to the aftertreatment diesel particulate filter indicating a possible damaged or plugged aftertreatment system.
3. Check for a damaged or restricted selective catalyst recirculation (SCR) decomposition tube. Refer to Procedure 011-062 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-062.html)

If equipped with an exhaust pressure tap, remove the test equipment and install the pipe plug. Coat the threads of the plug with high-temperature multi-purpose anti-seize compound prior to installation.



If an aftertreatment exhaust temperature sensor port was used, remove the test equipment and install the exhaust temperature sensor. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)

Note : Clear any inactive fault codes with INSITE™ electronic service tool once the testing is completed.

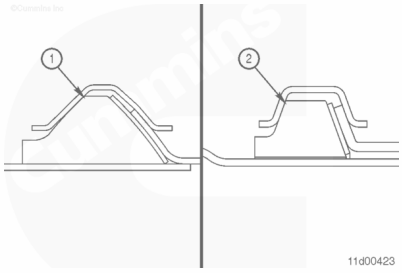
General Information

⚠ WARNING ⚠

The exhaust and exhaust components can remain hot after the engine has been shut down or secured. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they might come in contact with hot exhaust or exhaust components.

The exhaust outlet connection is attached to the outlet of the turbocharger that houses the inlet NOx sensor. Due to the number of various exhaust aftertreatment applications, this procedure has been written to be generic. **Not** all illustrations within this procedure will represent the application being serviced. The remove and install procedures are common regardless of the exhaust outlet connection configuration.

A variation in vehicle aftertreatment configuration will drive the aftertreatment to have different flanges. The clamps and gaskets on either end of the exhaust outlet connection can be different from one another. There are two types of flanged joints, spherical Marman® and full Marman®.



The spherical Marman® (1) joints allow a small amount of misalignment and have a rounded cross section. The full Marman® (2) joints are completely rigid and have a more edgy profile.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

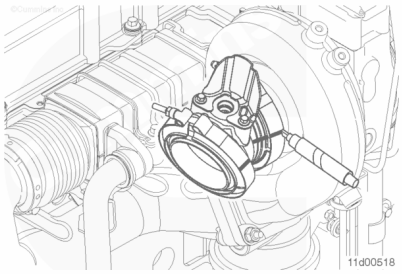
During regeneration, exhaust gas temperature can reach 800 °C [1500°F], and exhaust system surface temperature can exceed 700 °C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

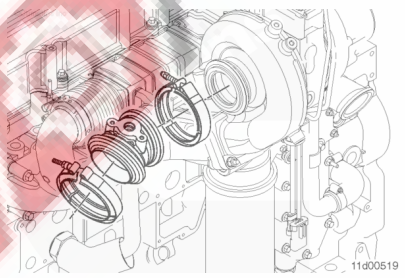
- Disconnect the batteries. See equipment manufacturer service information.
- Use compressed air to remove any loose debris.
- Remove the aftertreatment intake NOx sensor heat shield. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Remove the aftertreatment intake NOx sensor. Refer to Procedure 019-463 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-463.html)

- Draw an orientation reference line across each of the V-band clamps on either end of the exhaust outlet connection. This will aid in lining up the clamps and outlet to their original orientation during installation.



Remove

Remove the V-band clamps on either end of the exhaust outlet connection.



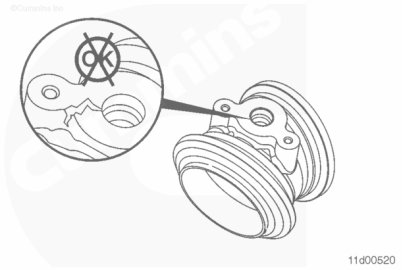
Depending on original equipment manufacturer (OEM) design, it can be necessary to loosen any supports to the down pipe attached to the exhaust outlet connection. See equipment manufacturer service information. This will provide enough space to remove the exhaust outlet connection.

Remove the exhaust outlet connection.

If applicable, discard the gasket.

Clean and Inspect for Reuse

Inspect the outlet connection for corrosion or structural damage.



Observe the outlet connection for oil spray on the inside walls of the tube. Use the following procedure if oil is on the inside of the walls of the tube. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)

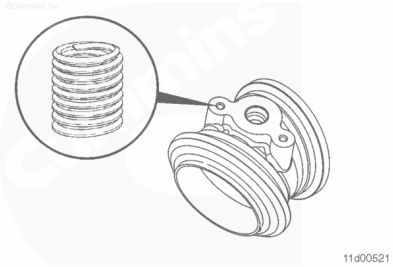
Inspect the aftertreatment intake NOx sensor mounting area for damage.

Inspect the threaded bosses of the intake NOx sensor mounting area. If the capscrew holes are damaged the exhaust outlet connection can be repaired.

ANADOLU ISUZU
PARTS SALES

Coiled thread inserts with inner coil threads M20 x 1.5 can be used.

Follow manufacturer recommended guidelines to install the coiled threaded insert.

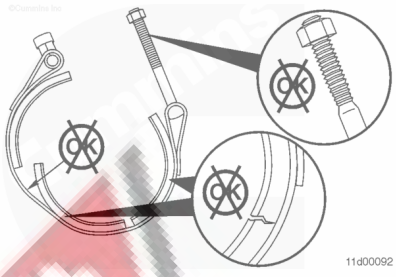


Inspect the V-band clamps and mounting straps for signs of over-extension.

The band **must not** be bent or damaged.

Inspect the V-band clamp and mounting strap threads for damage.

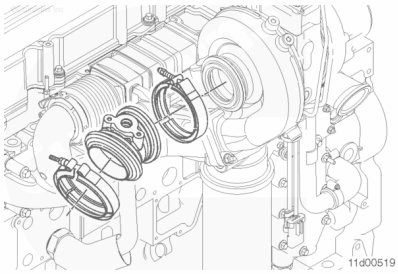
Replace the V-band clamp or mounting strap if damage is found.



Install

⚠ CAUTION ⚠

Do not use an air tool to tighten the V-band clamp(s). An air tool will damage the threads.



Note : The clamps on either end of the exhaust outlet connection may not be the same. See to the General Information section in this procedure. Where applicable, install and tighten the full Marman® clamps before the spherical Marman® clamps, to account for misalignment in the aftertreatment system.

Apply a coat of anti-seize compound on the threads of the V-band clamps.

Install a new gasket if applicable. Initially, do **not** completely tighten the clamp between the turbocharger and \exhaust outlet connection. Rotate the exhaust outlet connection, if necessary, to align with the down pipe and turbocharger using the identification marks made in the preparation step. Once properly aligned, tighten the clamps.

Torque Value: 14 n•m [124 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the aftertreatment intake NOx sensor. Refer to Procedure 019-463 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-463.html)
- Install the aftertreatment intake NOx sensor heat shield. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Tighten any exhaust hangers loosened in the removal process. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Start the engine. Check for exhaust leaks.

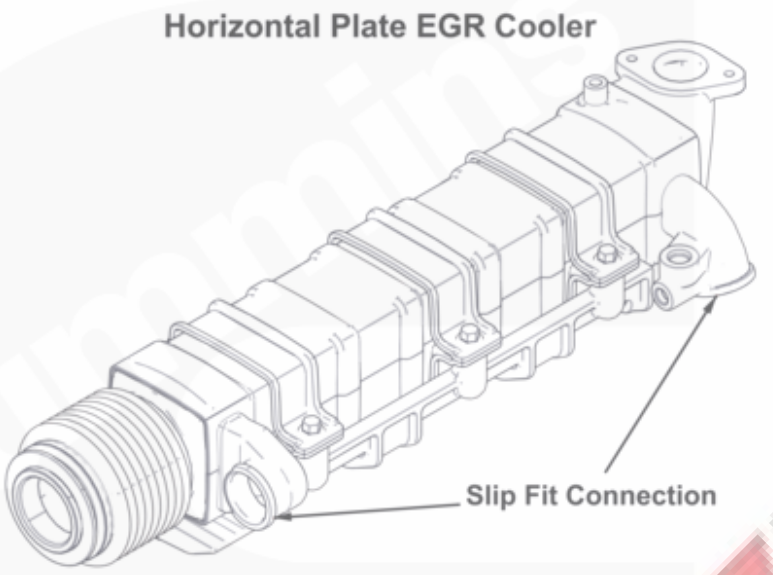
Additional Service Items

- No additional service items required.

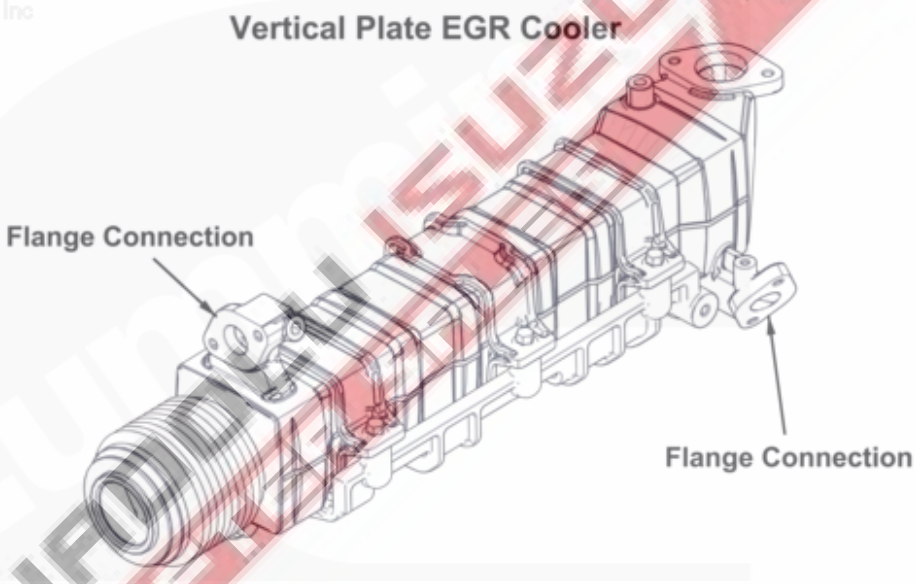
General Information

The illustrations show the horizontal plate EGR cooler and vertical plate EGR cooler. The engine can be equipped with one of the below two EGR coolers.

The horizontal plate EGR cooler is equipped with slip fit connection (without a flange) for the coolant inlet and outlet lines. The vertical plate EGR cooler is equipped with a flange connection for the coolant inlet and outlet lines.



Horizontal Plate EGR Cooler



Vertical Plate EGR Cooler

See the appropriate sections based on the EGR cooler type.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

Note : Brush away all dirt from around the area of the air handling connections to avoid contamination of the interior of the engine.

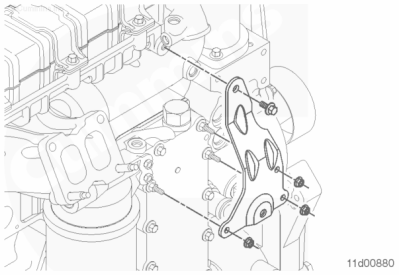
- Disconnect the batteries. See equipment manufacturer service information.
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the EGR connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Remove the exhaust gas pressure sensor tube. Refer to Procedure 011-027 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-027.html)
- Remove the exhaust gas pressure sensor. Refer to Procedure 019-376 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-376.html)
- Remove the EGR cooler coolant lines. Refer to Procedure 011-031 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-031.html)
- Remove the coolant vent line. Refer to Procedure 008-017 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-017.html)

Pressure Test

Horizontal Plate

Note : The engine **must** be within 3°C or 5°F of ambient temperature to perform the test. Testing the EGR cooler while hot will give false results.

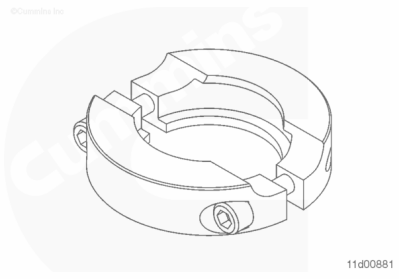
Note : Moisture in the EGR cooler or EGR connection tubes does **not** indicate a malfunctioning EGR cooler. The EGR cooler **must** be pressure tested before being replaced.



Remove the retaining screw and three nuts that hold the EGR cooler bracket in place. Remove the EGR cooler bracket.

Use EGR Cooler Leak Test Kit, Part Number 4919688 or 4918625, to check the EGR cooler for internal leaks.

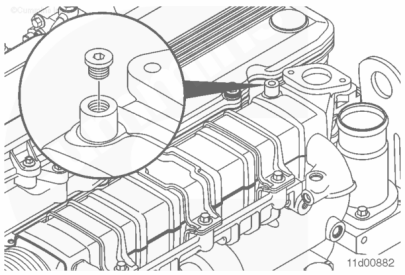
For EGR Cooler Leak Test Kit, Part Number 4918625, one of the collar sets will have to be replaced with collar assembly Part Number 4919691, to be able to orient the collar with the bolts facing away from the engine on the coolant outlet of the EGR cooler.



BINBOLU ISUZU DEALER SALES

Plug the EGR cooler vent fitting by installing threaded plug, Part Number 3678923.

Inspect the o-ring on plug, Part Number 3678923, for damage prior to use. If the o-ring is damaged, replace it with o-ring seal, Part Number 3678925, to make sure of an airtight seal.

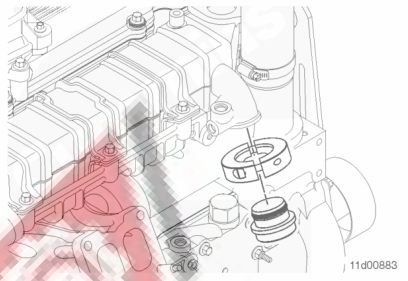


Plug the EGR cooler coolant outlet connection by installing plug, Part Number 4918627, and collar, Part Numbers 4919689 and 4919690.

Note : The collar **must** be installed in the orientation shown in the illustration to provide clearance for the exhaust manifold pressure sensor mounting boss.

Make sure the o-ring is lubricated with P-80 lubricant, Part Number 3824878, to prevent rolling and damaging the o-ring during installation.

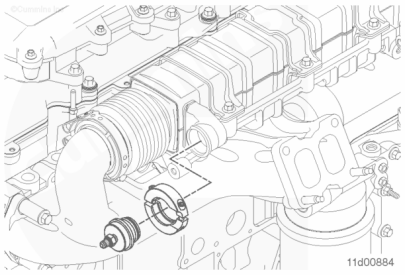
Inspect the o-ring on plug, Part Number 4918628, and plug, Part Number 4918627, for damage prior to use. If the o-ring is damaged, replace it with o-ring seal, Part Number 4919208, to make sure of an airtight seal.



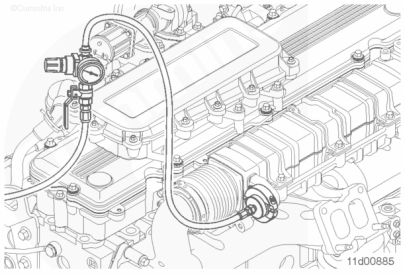
Plug the EGR cooler coolant inlet connection by installing plug, Part Number 4918628, collar, Part Numbers 4918626 and 4918702, or 4919689 and 4919690, and male connector, Part Number 68138.

Note : The collar **must** be installed in the orientation shown in the illustration to provide clearance for the EGR cooler body.

Make sure the o-rings are lubricated with P-80 lubricant, Part Number 3824878, to prevent rolling and damaging the o-ring during installation.

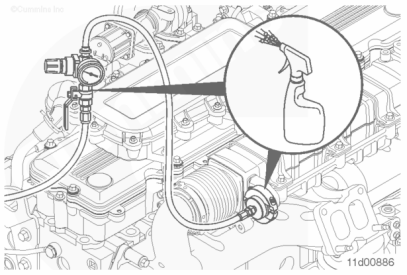


Connect air pressure regulator, Part Number 3164231, to the air fitting on plug, Part Number 4918628. Connect shop air to the inlet of the air pressure regulator.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



- Apply 483 kPa [70 psi] of air pressure to the cooler.
- Inspect for air escaping the EGR cooler assembly as a result of loose lines and fittings by spraying a mixture of mild soap and water at the fitting and line connections. Air leaks at these locations will **not** give accurate test results, and will lead to EGR coolers being replaced when they are **not** malfunctioning.
- Shut the air supply OFF to the regulator by using the ball valve. Disconnect the compressed air supply.
- Record the time the air supply was shut OFF and the air pressure shown on the air pressure regulator gauge.
- Periodically check the fittings for air leaks using the mixture of soap and water. If there are any air leaks found during the test, fix the leak and start the test over.
- Measure and record the air pressure after 20 minutes. If there is no pressure drop, the EGR cooler is reusable.
- If the measured pressure drop is greater than 138 kPa [20 psi], replace the EGR cooler.
- If the measured pressure drop is 138 kPa [20 psi] or less, check all of the fittings for air leaks. Correct any leaks found and test again.
- If any detectable pressure drop is seen on the second test and no air leaks are found on the test equipment, replace the EGR cooler.

Note : Open the ball valve to release any pressure in the EGR cooler before removing the test fittings.

Once the parts are cleaned and tested, cover open points with protective caps from Air Handling Clean Care Kit, Part Number 4919508.

If the EGR cooler is **not** usable, check the following items:

- Pressure check the cooling system for leaks. Leaks can be in original equipment manufacturer (OEM) coolant plumbing as well as on the engine which can cause EGR cooler malfunctions. Verify there are no other issues with the cooling system (water pump damage, fan drive damage, or similar). Refer to Procedure 008-020 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-020.html)
- Inspect the turbocharger turbine housing for signs of coolant deposits. Coolant deposits can typically be identified as dried white deposits coating the inside of the

housings. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)
- Inspect the EGR valve inlet for signs of coolant and clean if coolant is found. Refer to Procedure 011-022 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-022.html)
- Inspect the air intake connection for coolant. Clean if coolant is found. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)
- Replace the crankcase breather element. Refer to Procedure 003-019 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-019.html)
- If there is coolant contamination in the engine lubricating oil, change the engine lubricating oil. Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html) Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)

Note : If damage resulted in a hydraulic lock and the coolant level reached the intake manifold, it can be necessary to clean the charge air cooler. See equipment manufacturer service information.

Note : If damage resulted in a hydraulic lock and/or the coolant level reached the intake manifold, inspect the air compressor air inlet and outlet tubes for signs of coolant. If coolant is found, clean and inspect the air compressor head. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

Note : If damage resulted in a hydraulic lock, it can be necessary to remove the injectors and evacuate coolant from the cylinder(s). Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

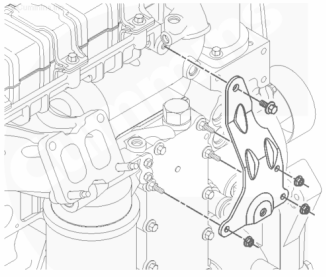
If the EGR cooler is reusable, remove the parts supplied in the service kit, install the EGR cooler bracket in the next step, and proceed to the Inspect for Reuse section of this procedure.

Install the EGR cooler bracket. Install and tighten the capscrews.

Torque Value: 24 n•m [212 in-lb]

Install and tighten the three hex nuts.

Torque Value: 10 n•m [89 in-lb]

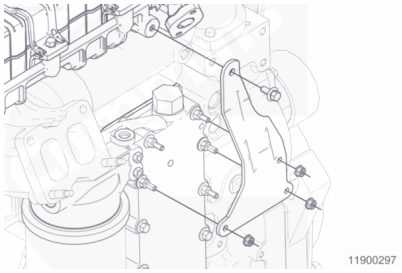


Vertical Plate

Note : The engine **must** be within 3°C or 5°F of ambient temperature to perform the test.

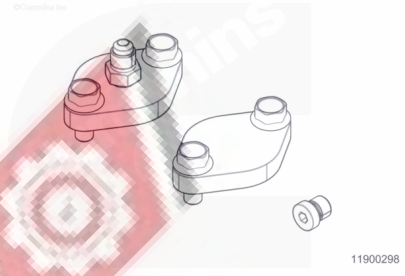
Note : Moisture in the EGR cooler or EGR connection tubes does **not** indicate a malfunctioning EGR cooler. The EGR cooler **must** be pressure tested before being replaced.

Remove the retaining screw and three nuts that hold the EGR cooler bracket in place. Remove the EGR cooler bracket.



11900297

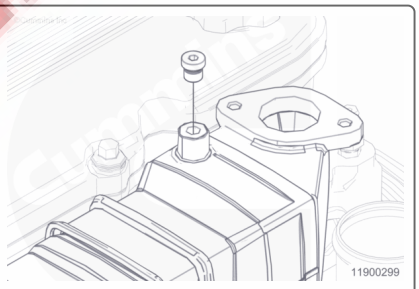
Use EGR Cooler Leak Test Kit, Part Number 5298810, to check the EGR cooler for internal leaks.



11900298

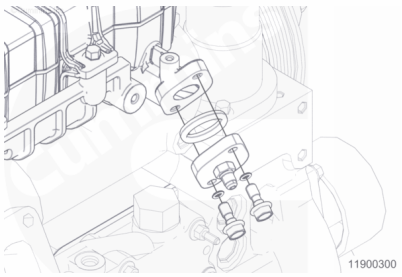
Plug the EGR cooler vent fitting by installing threaded plug, Part Number 3678923.

Inspect the o-ring on plug, Part Number 3678923, for damage prior to use. If the o-ring is damaged, replace it with o-ring seal, Part Number 3678925, to make sure of an airtight seal.



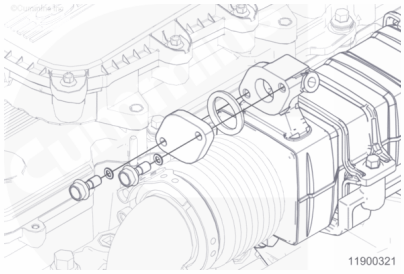
11900299

Plug the EGR cooler coolant outlet connection by installing plug, Part Number 5298811.



11900300

Plug the EGR cooler coolant inlet connection by installing plug, Part Number 5298884.



11900321

ANADOLU ISUZU AFTER SALES

Connect air pressure regulator, Part Number 3164231, to the air fitting on plug, Part Number 5298811. Connect shop air to the inlet of the air pressure regulator.

GRAPHIC NOT FOUND

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

GRAPHIC NOT FOUND

- Apply 483 kPa [70 psi] of air pressure to the cooler.
- Inspect for air escaping the EGR cooler assembly as a result of loose lines and fittings by spraying a mixture of mild soap and water at the fitting and line connections. Air leaks at these locations will **not** give accurate test results, and will lead to EGR coolers being replaced when they are **not** malfunctioning.
- Shut the air supply OFF to the regulator by using the ball valve. Disconnect the compressed air supply.
- Record the time the air supply was shut OFF and the air pressure shown on the air pressure regulator gauge.
- Periodically check the fittings for air leaks using a mixture of soap and water. If there are any air leaks found during the test, fix the leak and start the test over.
- Measure and record the air pressure after 20 minutes. If there is no pressure drop, the EGR cooler is reusable.
- If the measured pressure drop is greater than 138 kPa [20 psi], replace the EGR cooler.
- If the measured pressure drop is 138 kPa [20 psi] or less, check all of the fittings for air leaks. Correct any leaks found and test again.
- If any detectable pressure drop is seen on the second test and no air leaks are found on the test equipment, replace the EGR cooler.

Note : Open the ball valve to release any pressure in the EGR cooler before removing the test fittings.

Once the parts are cleaned and tested, cover open points with protective caps from Air Handling Clean Care Kit, Part Number 4919508.

If the EGR cooler is **not** usable, check the following items:

- Pressure check the cooling system for leaks. Leaks can be in OEM coolant plumbing as well as on the engine which can cause EGR cooler malfunctions. Verify there are no other issues with the cooling system (water pump damage, fan drive damage, or similar). Refer to Procedure

008-020 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-020.html)

- Inspect the turbocharger turbine housing for signs of coolant deposits. Coolant deposits can typically be identified as dried white deposits coating the inside of the housings. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)
- Inspect the EGR valve inlet for signs of coolant and clean if coolant is found. Refer to Procedure 011-022 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-022.html)
- Inspect the air intake connection for coolant. Clean if coolant is found. Refer to Procedure 010-080 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-080.html)
- Replace the crankcase breather element. Refer to Procedure 003-019 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-019.html)
- If there is coolant contamination in the engine lubricating oil, change engine lubricating oil. Refer to Procedure 007-013 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-013-tr.html) Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)

Note : If damage resulted in a hydraulic lock and the coolant level reached the intake manifold, it can be necessary to clean the charge air cooler. See equipment manufacturer service information.

Note : If damage resulted in a hydraulic lock and/or the coolant level reached the intake manifold, inspect the air compressor air inlet and outlet tubes for signs of coolant. If coolant is found, clean and inspect the air compressor head. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

Note : If damage resulted in a hydraulic lock, it can be necessary to remove the injectors and evacuate coolant from the cylinder(s). Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

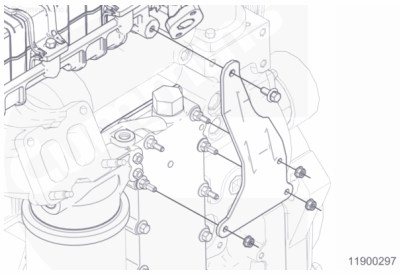
If the EGR cooler is reusable, remove the parts supplied in the service kit, install the EGR cooler bracket in the next step, and proceed to the Inspect for Reuse section of this procedure.

Install the EGR cooler bracket. Install and tighten the capscrews.

Torque Value: 24 n•m [212 in-lb]

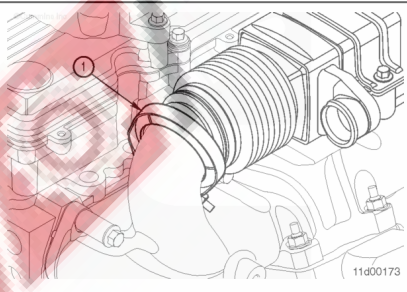
Install and tighten the three hex nuts.

Torque Value: 10 n•m [89 in-lb]



Remove

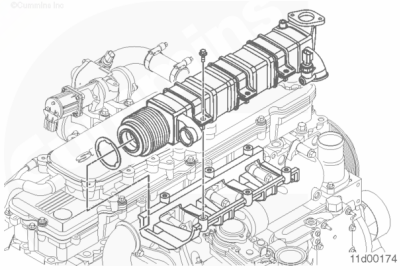
Remove the V-band clamp (1) and gasket from the EGR cooler inlet.



Remove the six capscrews holding the EGR cooler to the EGR cooler bracket.

Remove the EGR cooler.

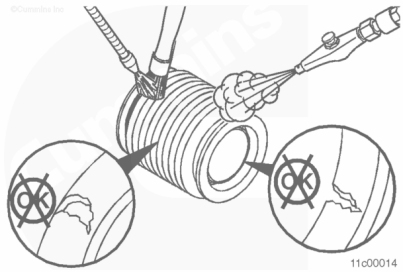
Cover open connections with protective caps from Air Handling Clean Care Kit, Part Number 5298776.



Clean and Inspect for Reuse

Inspect the EGR cooler bellows for cracks or other damage.

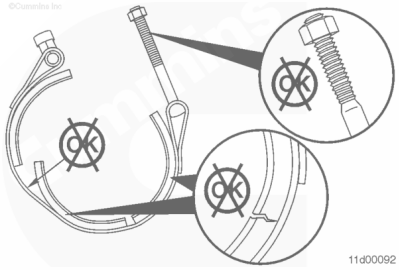
Replace the EGR cooler if damage is found.



Inspect the V-band clamp threads for damage.

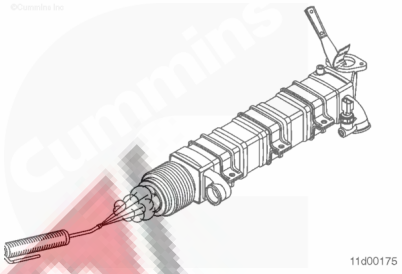
Replace the V-band clamp if damage is found.

ANADOLU ISUZU
AUTHORIZED DEALER



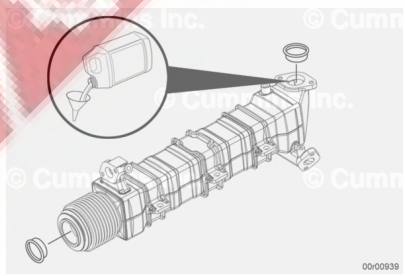
Remove any gasket material from the EGR cooler gas outlet connection.

Inspect the EGR cooler for signs of external leaks or cracks.



⚠ CAUTION ⚠

Do not use chlorinated water to clean or rinse the EGR cooler. Chlorides are very corrosive to the stainless alloys internal and external to the EGR cooler.



Cap the exhaust gas outlet end of the EGR cooler with the plastic caps supplied in the EGR Cooler Leak Check Kit, Part Number 4919688.

Completely fill the EGR cooler with safety solvent.

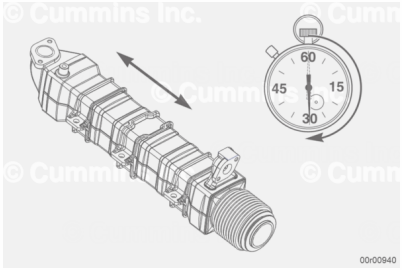
Cap the exhaust gas inlet of the EGR cooler with the plastic cap supplied in the EGR Cooler Leak Check Kit, Part Number 4919688.

Lay the EGR cooler on its side.

Allow the EGR cooler to soak for approximately 20 minutes.

Drain approximately 25 percent of the liquid from the cooler and recap. Dispose of this liquid properly.

Shake the cooler by hand, from end-to-end, for approximately 30 seconds.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Drain the remaining safety solvent from the EGR cooler and properly dispose of it.

Use compressed air to dry the inside of the EGR cooler and remove any loose debris or particles.

Cap the exhaust gas outlet of the EGR cooler with the plastic cap supplied in the EGR Cooler Leak Check Kit, Part Number 4919688.

Completely fill the EGR cooler with water.

Cap the exhaust gas inlet end of the EGR cooler with the plastic cap supplied in the EGR Cooler Leak Check Kit, Part Number 4919688.

Shake the cooler by hand, from end-to-end, for approximately 30 seconds.

Drain the water from the EGR cooler and properly dispose of it.

Use compressed air to dry the inside of the EGR cooler.

Replace the EGR cooler if cracks or other damage is found.

Clean the EGR cooler exhaust gas inlet and outlet with safety solvent.

Dry with compressed air.

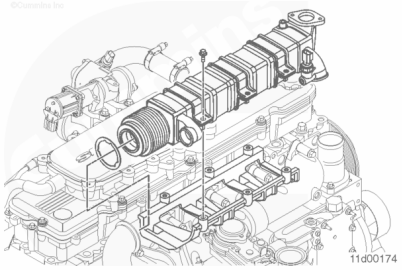
Inspect the EGR cooler exhaust gas inlet and outlet for signs of fretting, cracks, or other damage.

Replace the EGR cooler if any damage is found.

ANADOLU ISUZU PARTS SALES

Install

Install the EGR cooler to the EGR cooler bracket. Leave the six capscrews loose to minimize assembly stress on the EGR cooler bellows.

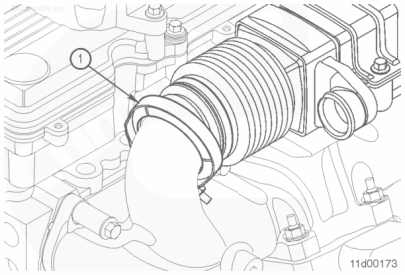


Connect the EGR cooler exhaust gas inlet bellows to the exhaust manifold with a new gasket.

Tighten the clamp.

Torque Value: 17 n•m [150 in-lb]

With the EGR cooler bellows aligned to the exhaust manifold, hand tighten the six capscrews holding the EGR cooler to the EGR cooler bracket.



Tighten the capscrews in an alternating pattern, starting from the center and working toward the outside.

Torque Value: 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the coolant vent line. Refer to Procedure 008-017 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-017.html)
- Install the EGR cooler coolant lines. Refer to Procedure 011-031 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-031.html)
- Install the exhaust gas pressure sensor. Refer to Procedure 019-376 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-376.html)
- Install the exhaust gas pressure sensor tube. Refer to Procedure 011-027 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-027.html)
- Install the EGR connection tube. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Fill the engine with coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Note : If a malfunction resulted in coolant entering the exhaust system, the aftertreatment system can be recovered. Refer to Procedure 014-015 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-015.html)

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Air Handling Clean Care Kit, Part Number 5298776, or equivalent

Additional Service Items

- Nylon bristle and/or wire brush
- Pick or scraping tool
- 90 degree bent pick

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

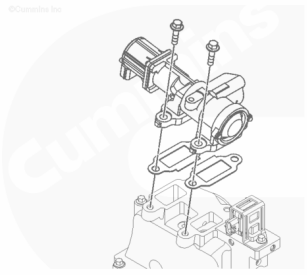
Note : Brush away all dirt from around the area of the air handling connections to avoid contamination of the interior of the engine.

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the exhaust gas recirculation (EGR) connection tube from the EGR valve. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- Disconnect the electrical connection from the EGR valve.

Remove

Clean the area around the EGR valve with a clean cloth to help prevent debris from entering the air intake system when the EGR valve is removed.

Remove the four capscrews holding the EGR valve to the air intake connection. Remove the EGR valve.



11d00198

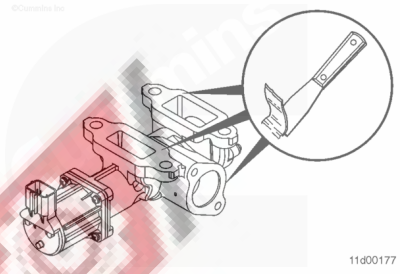
Use protective caps from Air Handling Clean Care Kit, Part Number 5298776, or equivalent, or heavy tape to cover any open connections to prevent debris from entering the system.

Clean and Inspect for Reuse

Clean the EGR valve and air intake connection mounting surfaces of gasket material, taking care to keep any debris out of the air intake system.

A light coating of carbon is common on the inside of the EGR valve and does **not** need to be removed.

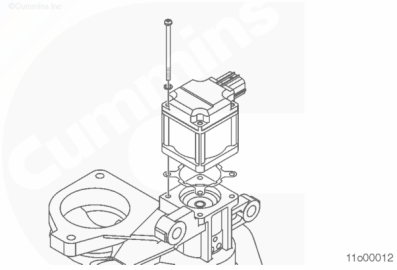
Note : The EGR valve has a green corrosion-resistant coating on its inner surfaces. Do **not** remove this coating.



Remove the four capscrews that hold the EGR valve motor to the EGR valve base.

Remove the EGR valve motor. Take care to keep the shim with the motor.

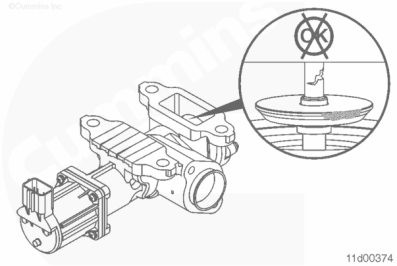
Note : Note the orientation of the electrical connector with respect to the valve body. A witness mark on the outside of the motor case and valve body can be used to document the orientation. This orientation **must** be the same upon reassembly.



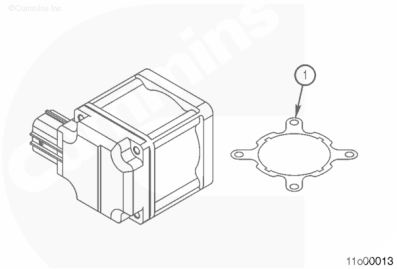
Inspect the EGR valve seats and stem for galling, pitting, cracks, or excessive corrosion.

If the EGR valve shows signs of internal damage, replace the EGR valve.

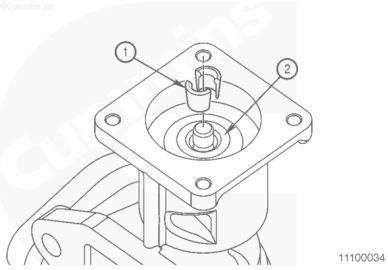
Note : Soot and condensation leaking from the weep hole on the EGR valve is considered normal, and does **not** mean the EGR valve needs to be replaced.



Note : The shim (1) is specific to that valve and can **not** be replaced. If the shim is lost or damaged, replace the EGR valve.

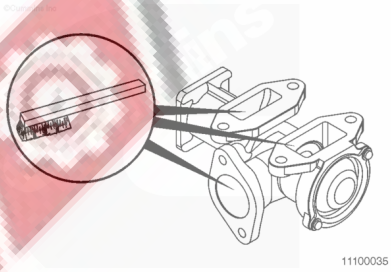


Use two fingers to press down on the valve spring retainer (1) to unlock two valve keepers (2). If valve keepers will **not** release using finger pressure, locate a 5/8" deep socket to the spring retainer (1). Gently tap on the socket with a small hammer to release the keepers. Use two fingers and press for keeper removal.

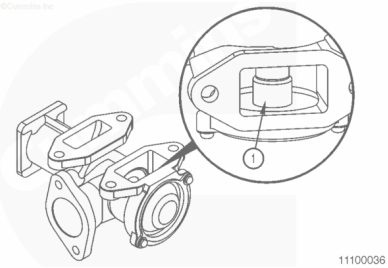


Note : The spring, spring keepers, and spring retainer can **not** be replaced. If the spring, spring keepers, or spring retainer are lost or damaged, replace the EGR valve.

Clean the accumulated soot from the EGR valve inlet port and outlet ports with a nylon bristle and/or wire brush. Some deposits may need to be scraped out with a pick or scraping tool. Remove as much material as possible before applying any cleaner and without damaging the poppet sealing surfaces and anti-corrosion finish inside the EGR valve body.

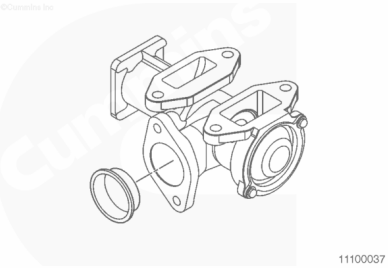


Clear the area around the soot guard (1) in the outlet port with a 90 degree bent pick. Clear any deposit material all the way around the front and the back of the soot guard. Make sure that there is no deposit material on or around the soot guard that could hold the poppet shaft open.



⚠ WARNING ⚠

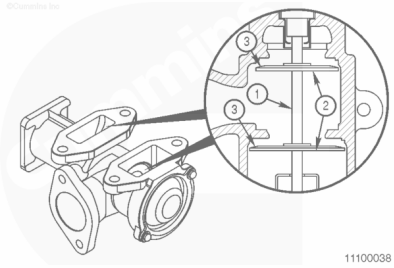
When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recomendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



Spray carburetor cleaner into the EGR valve outlet ports to soak inner surfaces. Use Clean Care Kit plug, Part Number 4919416, available in ISC/ISL Clean Care Kit, Part Number 5298776, to seal the EGR valve inlet and fill the EGR valve cavity with carburetor cleaner. Soak for 5 minutes. Work the poppet shaft back and forth. Turn it while the poppets are in contact with the valve seats (closed position) to help clean the valve. After 5 minutes, drain and properly dispose of the excess cleaner.

Note : Carburetor cleaner is the most effective solvent for this procedure. Do **not** substitute any other cleaning solvent.

The EGR valve shaft stem (3) is comprised of two valve faces (1) on two valve seats. Using a small nylon or brass wire brush, lightly brush away loose soot from the stem (3), valve seat (2) and also from the valve seat on the EGR valve housing. Take care **not** to damage the poppet sealing surfaces.

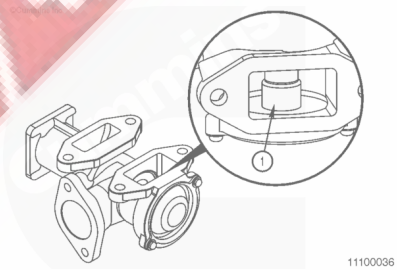


11100038

Spray additional carburetor cleaner, as needed, to clean the sealing surfaces.

Note : Carburetor cleaner is the most effective solvent for this procedure. Do **not** substitute any other cleaning solvent.

The soot guard (1) is comprised of outer and inner cylinders which must be able to close with a small gap at the bottom. Use a small nylon or brass wire brush. Brush away deposits from the soot guard. Deposits can be on the back side of the soot guard causing the valve **not** to close fully.



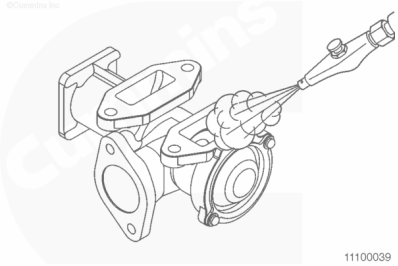
11100036

Spray additional carburetor cleaner, as needed, to clean the sealing surfaces.

Note : Carburetor cleaner is the most effective solvent for this procedure. Do **not** substitute any other cleaning solvent.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



11100039

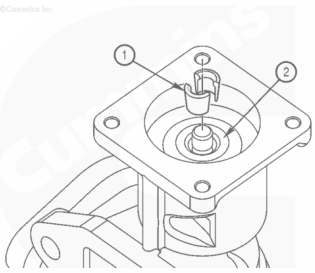
Drain any remaining carburetor cleaner from the EGR valve and properly dispose of the liquid.

Used compressed air to dry the inside of the EGR valve.

Repeat the cleaning steps, if needed.

Note : An effectively cleaned valve will close with a metal sound when the poppet shaft is closed. A soft thud is an indication deposits are still holding the EGR valve partially open.

Install the spring, spring retainer, and spring keepers.

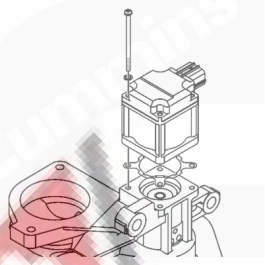


11100034

Install the EGR valve motor, shim, and four capscrews to the base.

Torque Value:
EGR Motor Capscrews 2.5 n•m [22 in-lb]

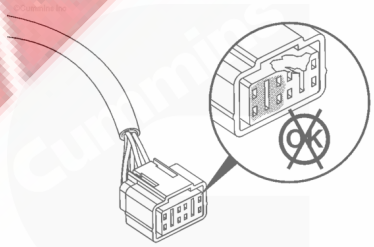
Note : EGR valve motor electrical connector **must** be oriented in the same direction as when originally disassembled.



11c00012

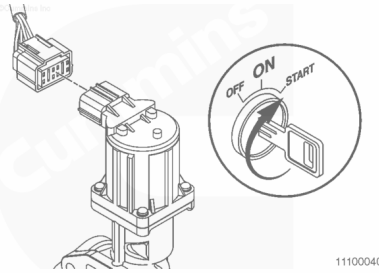
Inspect the engine wiring harness EGR valve actuator connector for corrosion, worn receptacles, or other damage.

Replace the engine wiring harness EGR valve connector if corrosion, worn receptacles, or other damage is found.



11c00175

After cleaning the EGR valve, connect the electrical connector to the EGR valve. Turn the ignition keyswitch ON. Do **not** start the engine. Check for active Fault Code 1896. If Fault Code 1896 persists after cleaning, replace the EGR valve.

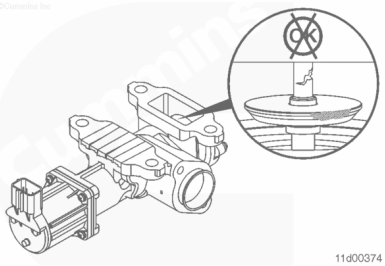


11100040

Inspect the EGR valve seats and stem for galling, pitting, cracks, or excessive corrosion.

If the EGR valve shows signs of internal damage, replace the EGR valve.

Note : Soot and condensation leaking from the weep hole on the EGR valve is considered normal, and does **not** mean the EGR valve needs to be replaced.

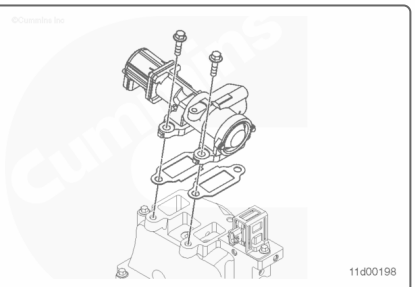


11d00374

ANADOLU ISUZU
PARTS

Install

Note : Remove all protective caps from the component.



Install the EGR valve with new mounting gaskets onto the air intake connection.

Install the four capscrews holding the EGR valve to the air intake connection. Tighten in a crisscross pattern.

Torque Value: 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the electrical connection to the EGR valve.
- Connect the EGR connection tube to the EGR valve. Refer to Procedure 011-025 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-025.html)
- If a malfunction resulted in coolant, oil, excessive fuel or excessive black smoke entering the exhaust system, the aftertreatment system **must** be inspected. Refer to Procedure 014-017 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-017.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

General Information

The exhaust gas recirculation (EGR) connection tube is the tube which connects the EGR valve to the EGR cooler.

There are three different styles of EGR connection tubes used on this engine: one for engines without compression brakes, one for engines with compression brakes, and one for engines used in transit bus applications.

There are two different styles of EGR connection tubes used on this engine: one for engines without compression brakes and one for engines with compression brakes.

The illustrations in this procedure may **not** exactly match the engine being serviced. The procedure is the same regardless of the style of the EGR connection tube.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

All configurations:

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the EGR temperature sensor. Refer to Procedure 019-378 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-378.html)

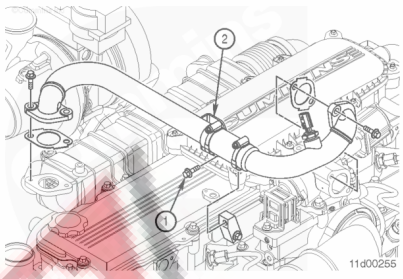
Remove

Clean the area around the flanges of the EGR connection tube. Use a clean cloth.

GRAPHIC NOT FOUND

⚠ CAUTION ⚠

Do not twist or bend the EGR connection tube during removal or installation, or damage to the hose can result.



Remove the capscrew (1) from the support flange of the EGR connection tube (2).

Remove the EGR connection tube by loosening the bolted flanges from both sides of the EGR connection tube.

Use caution to keep debris from falling into the EGR cooler and EGR valve when removing the EGR connection tube.

Cover all open connections with protective caps from Air Handling Clean Care Kit, Part Number 5298776.

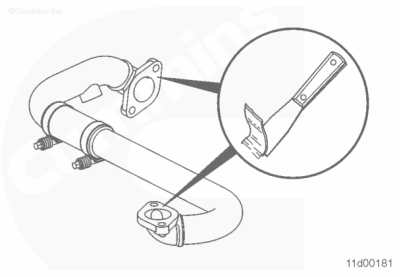
Clean and Inspect for Reuse

Scrape the gasket surfaces of the EGR connection tube, EGR valve, and EGR cooler free of gasket material.

Use caution **not** to drop any foreign material into the EGR cooler or EGR valve.

Note : It is common for the EGR components to have a buildup of carbon on the inside surfaces. This buildup is normal and does **not** have to be removed.

Note : If the EGR connection tube will be off the engine for a prolonged period of time, tape over the openings in the EGR cooler and EGR valve to prevent debris from entering the air intake system.

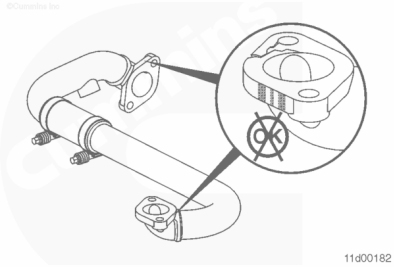


Inspect the EGR connection tube for cracks, distortion, corrosion, or soot streaking on the outside of the connection tube, indicators of an EGR leak.

Inspect for signs of coolant in the EGR connection tube.

If signs of coolant are found in the EGR connection tube, inspect the EGR cooler for leaks. Refer to Procedure 011-019 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-019.html)

Replace the EGR connection tube if any cracks or other damage is found.

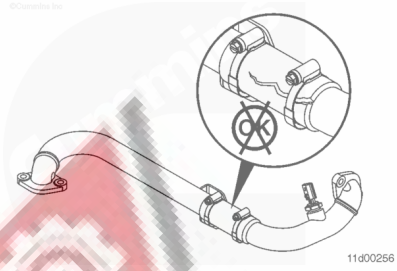


Loosen both hose clamps, then remove the hose if inspection is needed.

Inspect the interior and exterior of the hose connecting the two pieces of the EGR connection tube for damage. Replace if any damage is found.

Tighten the hose clamps.

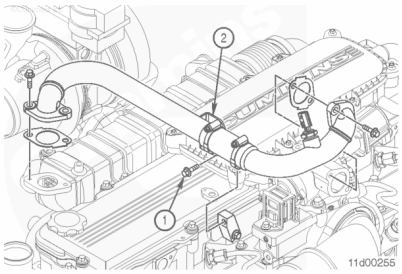
Torque Value: 5 n•m [44 in-lb]



Install

⚠ CAUTION ⚠

Do not twist or bend the EGR connection tube during removal or installation or damage to the hose can result.



Install the EGR connection tube (2). Use new gaskets.

Install the capscrew and mounting capscrew (1) at the EGR cooler outlet, EGR valve inlet, and tube brace hand-tight. Check for correct alignment at all locations. Make sure the EGR crossover tube does **not** contact the rocker lever cover.

Tighten the capscrews and mounting capscrews in the following sequence:

Tighten the brace mounting capscrew.

Torque Value: 24 n•m [212 in-lb]

Tighten the capscrews at the EGR cooler outlet.

Torque Value: 24 n•m [212 in-lb]

Tighten the capscrews at the EGR valve inlet.

Torque Value: 24 n•m [212 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the EGR temperature sensor. Refer to Procedure 019-378 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-378.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

General Information

For details on the type of exhaust gas recirculation (EGR) coolers (horizontal plate or vertical plate), see the General information section in the EGR cooler procedure.

Preparatory Steps

⚠ WARNING ⚠

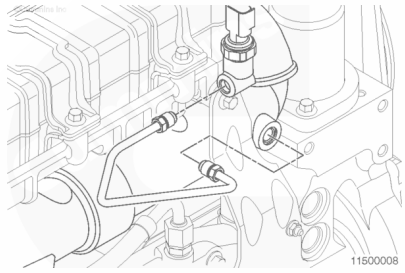
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the exhaust gas pressure sensor. Refer to Procedure 019-376 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-376.html)

Remove

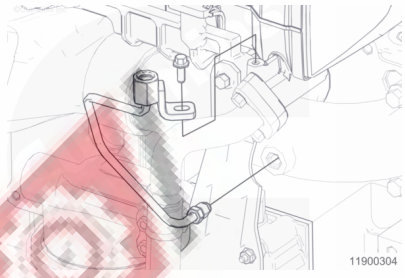
Horizontal Plate

Remove the exhaust gas pressure sensor tube from the exhaust manifold.



Vertical Plate

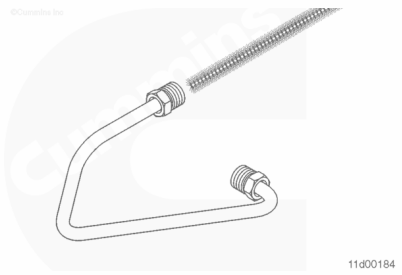
Remove the capscrew mounting the pressure sensor tube to the EGR cooler coolant outlet casting. Remove the pressure sensor tube from the exhaust manifold.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

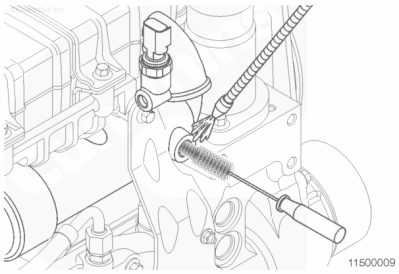
Clean the exhaust gas pressure sensor tube. Use solvent. Dry with compressed air.

Inspect the tube for signs of leakage, damaged sealing areas, or plugging with soot.

If the tube is plugged with soot, use safety solvent and a pipe cleaner or similar device to remove the soot blockages in the tube.

Inspect the port on the exhaust manifold for signs of leaks or damage.

Leaks can be identified by soot streaks.



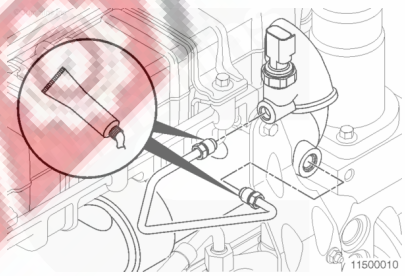
Install

Horizontal Plate

Put a light coating of high-temperature anti-seize compound, Part Number 3824732, or equivalent, on the threads of both fittings of the exhaust pressure sensor tube prior to installation.

Install the exhaust gas pressure sensor tube to the exhaust manifold.

Torque Value: 18 n•m [159 in-lb]



Vertical Plate

Put a light coating of high-temperature anti-seize compound, Part Number 3824732, or equivalent, on the threads of both fitting of the exhaust pressure sensor tube prior to installation.

Install the pressure sensor tube to the exhaust manifold.

Install the pressure sensor tube to EGR cooler coolant outlet casting with a capscrew.

Tighten both the capscrew and exhaust gas pressure sensor tube fitting hand-tight before tightening.

Tighten the fitting.

Torque Value: 18 n•m [159 in-lb]

Tighten the capscrew.

Torque Value: 10 n•m [89 in-lb]

Remove the EGR cooler coolant return line fitting from the cylinder block (front of engine).

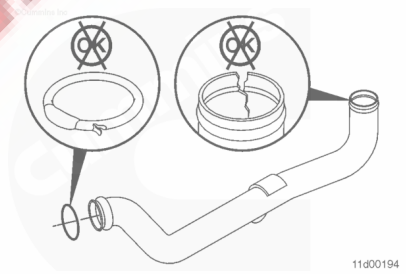
Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the tubes. Use solvent. Dry with compressed air.

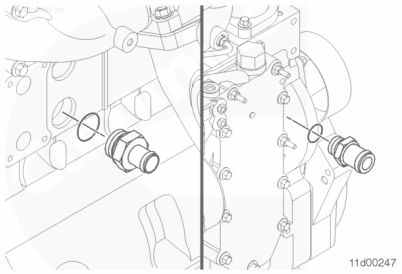
Inspect the tubes for cracks or leaks.

Inspect the sealing o-ring for cracks or distortion. Replace, as necessary.

Install

Horizontal Plate

Note : If replacing a horizontal plate cooler to a vertical plate cooler, see the installation directions in the vertical plate cooler section.



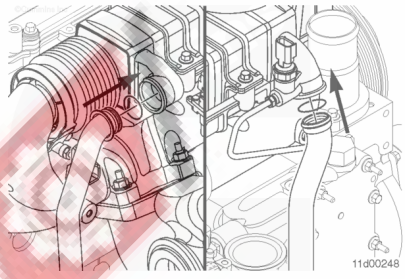
Install the EGR cooler coolant supply line fitting into the cylinder block (rear of engine).

Torque Value: 115 n•m [85 ft-lb]

Install the EGR cooler coolant return line fitting into the cylinder block (front of engine).

Torque Value: 85 n•m [63 ft-lb]

Lubricate the sealing o-rings with assembly lubricant, Part Number 3163087, or equivalent, before installing the EGR cooler coolant lines into the EGR cooler.



Push the EGR cooler coolant lines into the EGR cooler in the directions shown in the illustration.

Push the EGR cooler coolant line hoses onto the coolant fittings in the cylinder block. Tighten the hose clamps.

GRAPHIC NOT FOUND

Torque Value: 5 n•m [44 in-lb]

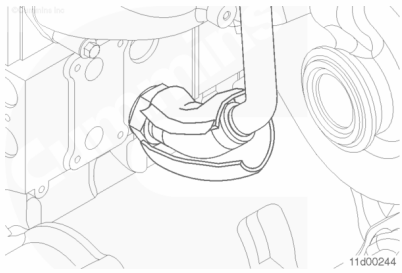
Install the EGR cooler coolant outlet line to the EGR cooler and oil cooler cover. Tighten the mounting nut.

Torque Value: 10 n•m [89 in-lb]

Install the EGR cooler coolant inlet line to the EGR cooler and EGR cooler bracket. Tighten the capscrew.

Torque Value: 24 n•m [212 in-lb]

Install the heat shield to the EGR cooler coolant inlet line hose.



Make sure the edge of the heat shield is snug against the cylinder block coolant inlet fitting and covers the entire length of the hose.

Vertical Plate

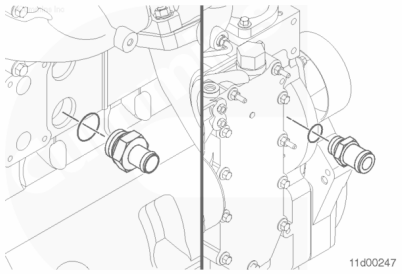
Apply lubricant/anti-seize to both thread of the EGR coolant supply line coupling.

Install the EGR cooler coolant supply line coupling into the cylinder block (rear of engine).

Torque Value: 115 n•m [85 ft-lb]

Apply lubricant/anti-seize to both thread of the EGR coolant return line coupling.

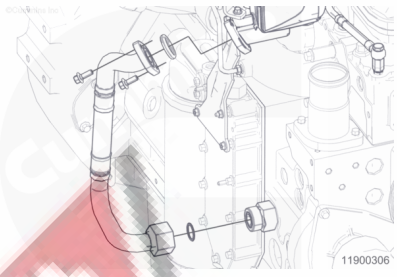
Install the EGR cooler coolant return line coupling into the cylinder block (front of engine).



Torque Value: 85 n•m [63 ft-lb]

Install the coolant return tube swivel-nut (hand-ight) to the coupling at the front of the block. Make sure the o-ring is in place on the coupling.

Tighten the capscrews attaching coolant return tube at the front of the EGR cooler. Make sure the diamond seal is in place.



Torque Value: 24 n•m [212 in-lb]

Tighten the swivel-nut on the coupling at the front of the block.

Torque Value: 85 n•m [63 ft-lb]

Install the coolant supply tube swivel-nut (hand-tight) to the coupling at the rear of the block. Make sure the o-ring is in place on the coupling.

GRAPHIC NOT FOUND

Tighten capscrews attaching coolant supply tube at the rear of the EGR cooler. Make sure the diamond seal is in place.

Torque Value: 24 n•m [212 in-lb]

Tighten the swivel-nut on the coupling at the rear of the block.

Torque Value: 85 n•m [63 ft-lb]

ANADOLU ISUZU USER SALES

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the coolant vent lines. Refer to Procedure 008-017 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-017.html)

- Connect the turbocharger coolant return line onto the EGR cooler coolant return line. Refer to Procedure 010-041 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-041.html)
- Fill the engine with coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

- No additional service items required.

General Information

⚠ WARNING ⚠

The exhaust and exhaust components can remain hot after the engine has been shut down or secured. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair. Make sure that no combustible materials are located where they might come in contact with hot exhaust or exhaust components.

⚠ WARNING ⚠

Improper practices, carelessness, or ignoring the warnings can cause burns, cuts, mutilation, asphyxiation, or other personal injury or death.

There are heat shields mounted in various locations on the engine and aftertreatment system.

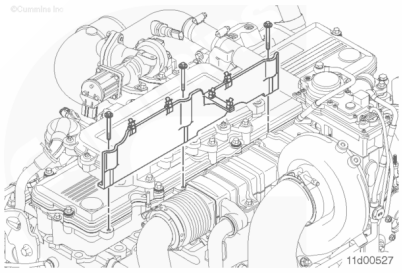
Heat shields reduce heat exposure to various components from the exhaust and exhaust gas recirculation (EGR) components.

In the following information are examples of the different heat shields found on MidRange Cummins® engines.

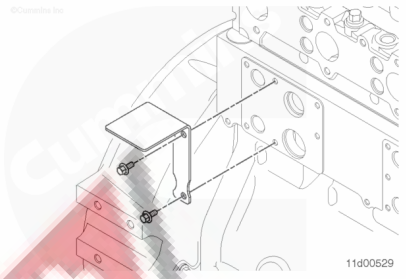
Due to the number of heat shield mounting locations, this procedure has been written to be generic. The Remove and Install procedures are common, regardless of the style of heat shield used.

The NOx sensor module, crankcase breather, and rocker cover heat shield all attach to the rocker housing.

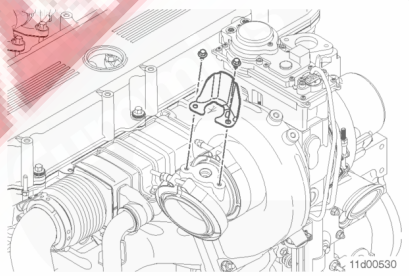
The heat shield also provides attachment points for the NOx sensor wiring.



The selective catalytic reduction (SCR) coolant supply fitting heat shield attaches to the cylinder block.



The aftertreatment intake NOx sensor heat shield is **not** applicable or required for all original equipment manufacturers (OEMs). The aftertreatment intake NOx sensor heat shield typically attaches to the exhaust outlet connection.

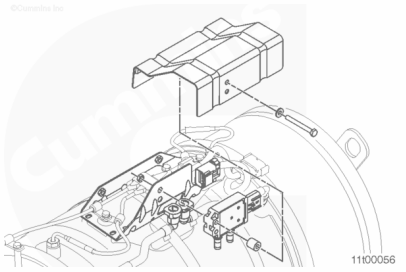


The diesel particulate filter (DPF) sensor table heat shield is **not** applicable or required for all OEMs. The DPF sensor table heat shield mounts to the DPF sensor table.

Note : The DPF sensor table heat shield uses the same mounting bolts as the DPF differential pressure sensor. There is a spacer located between the heat shield and DPF differential pressure sensor. Note the location and orientation of this spacer during removal and installation.

Mounting capscrew torque value:

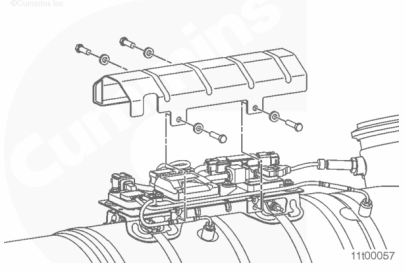
Torque Value: 14 n•m [124 in-lb]



The SCR sensor table heat shield is **not** applicable or required for all OEMs. The SCR sensor table heat shield mounts to the SCR sensor table.

Mounting capscrew torque value:

Torque Value: 14 n•m [124 in-lb]



Preparatory Steps

⚠ WARNING ⚠

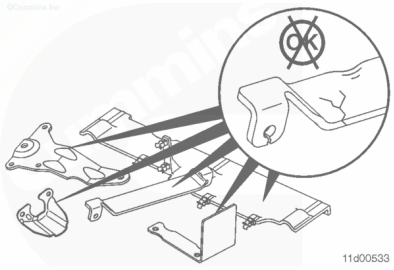
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the heat shield.

Clean and Inspect for Reuse

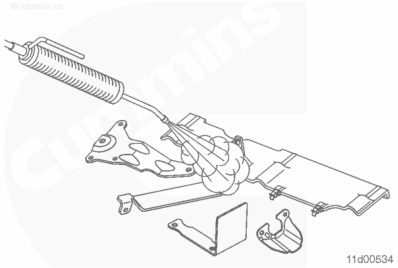
Inspect the heat shield for cracks or other damage.

Replace the heat shield if cracks or other damage is found.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Wash the heat shield in a hot, soapy water solution or steam clean, if desired.

Dry with compressed air.

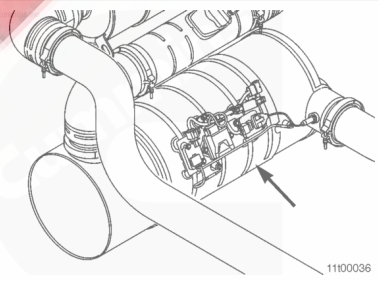
General Information

⚠ WARNING ⚠

The exhaust and exhaust components can remain hot after the engine has been shut down or secured. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair. Make sure that no combustible materials are located where they might come in contact with hot exhaust or exhaust components.



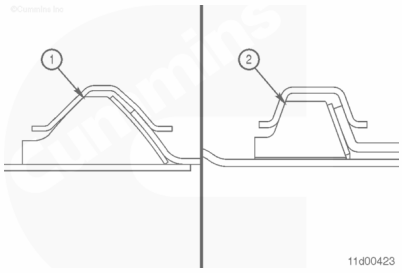
⚠ CAUTION ⚠

The catalyst elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system, as damage to the catalyst element can result.

Due to the number of varying exhaust aftertreatment applications, this procedure has been written to be generic. **Not** all illustrations within this procedure will represent the application being serviced.

Different vehicles will require different aftertreatment configurations. Some of the aftertreatment selective catalytic reduction (SCR) catalysts can have elbows clamped to them.

A variation in vehicle aftertreatment configuration will cause the aftertreatment SCR catalyst to have different flanges. The clamps and gaskets on either end of the aftertreatment SCR catalyst may be different from one another. There are two types of flanged joints, spherical Marmon® and full Marmon®. The spherical Marmon® (1) joints allow a small amount of misalignment and have a rounded cross section. The full Marmon® (2) joints are completely rigid and have a more edgy profile.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800 °C [1500°F], and exhaust system surface temperature can exceed 700 °C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair. Make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

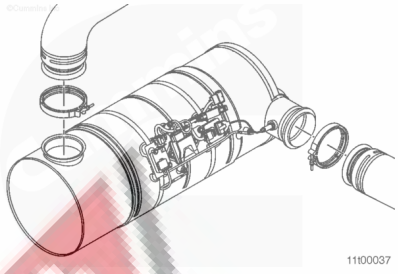
- Disconnect the batteries. See equipment manufacturer service information.
- Clean the area with compressed air to remove any loose debris.
- Draw an orientation reference line across each of the V-band and Torca™ clamps on either end of the aftertreatment SCR canister. This will aid in lining up the clamps and canister to their original orientation during installation.
- Remove the aftertreatment outlet NOx sensor probe. Refer to Procedure 019-451 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-451.html)

- Disconnect the aftertreatment interface harness from the original equipment manufacturer wiring (OEM) harness connection.

Remove

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



Support the aftertreatment decomposition tube to prevent it from being freely suspended after the aftertreatment SCR catalyst is removed. If supporting it is **not** an available option, remove the aftertreatment diesel exhaust fluid (DEF) decomposition tube. Refer to Procedure 011-062 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-062.html)

Support the aftertreatment SCR catalyst with a lowering jack.

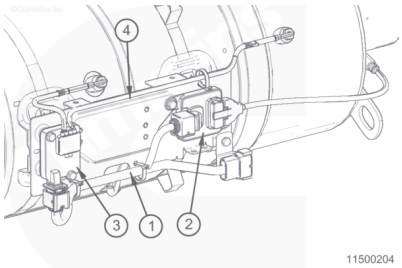
Remove the clamps on either end of the aftertreatment SCR catalyst.

Remove the exhaust hangers that support the aftertreatment SCR catalyst. Slowly remove the canister from the vehicle.

Discard the gasket from the V-band joint.

Disassemble

If the aftertreatment SCR catalyst is being replaced, complete the following procedures to remove the key parts of the aftertreatment SCR catalyst.



Disconnect and remove the aftertreatment interface harness (1). Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)

Disconnect and remove the aftertreatment temperature sensor assembly (2). Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)

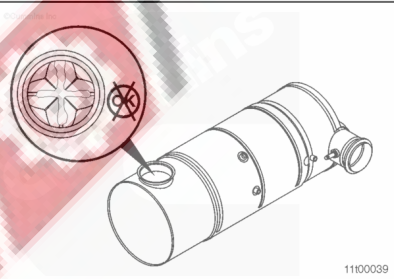
Remove the aftertreatment outlet NOx sensor module and probe assembly (4). Refer to Procedure 019-451 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-451.html)

Remove the aftertreatment SCR catalyst temperature sensor interface module mounting bracket (5). Refer to Procedure 011-076 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-076.html)

Clean and Inspect for Reuse

⚠ CAUTION ⚠

Do not use a metallic object to clean the aftertreatment SCR catalyst. This will scratch the surface of the aftertreatment SCR catalyst which can cause future excessive DEF deposits.



Inspect the aftertreatment SCR catalyst for cracks or puncture holes, especially around the weld areas.

Replace the aftertreatment SCR catalyst if damaged.

Inspect the aftertreatment SCR catalyst inlet for DEF deposits.

If buildups are present, carefully scrape the buildup with a non-metallic object to clean the majority of the buildup from the catalyst.

Excessive fuel or oil buildup will damage the exhaust catalyst. If oil from an upstream engine malfunction is visible in the exhaust plumbing, replace the aftertreatment SCR catalyst.

Note : Do **not** use a mechanical device to remove DEF deposits from the aftertreatment. SCR catalyst.

Note : Do **not** use a pressure washer to remove DEF deposits from the aftertreatment SCR catalyst.

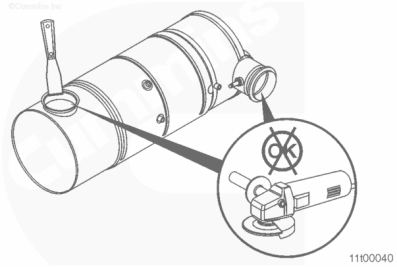
Note : If crystallization buildup was present after installation, complete a stationary regeneration to make sure any of the remaining DEF crystallization has been removed from the aftertreatment SCR catalyst.

Inspect the exhaust flanges for corrosion or other damage.

Use a putty knife to remove any residual gasket material from the flanges on the aftertreatment SCR catalyst.

Avoid dropping fragments of gasket material into the aftertreatment SCR catalyst.

Do **not** grind on the flange surface, as this can damage the flange and cause the connection to leak.

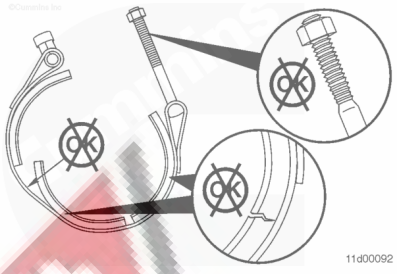


Inspect the V-band clamps and mounting straps for signs of over-extension.

The band **must not** be bent or damaged.

Inspect the V-band clamp and mounting strap threads for damage.

Replace the V-band clamp or mounting strap if damage is found.



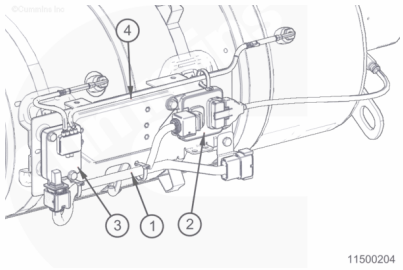
Assemble

Install the aftertreatment SCR catalyst temperature sensor interface module mounting bracket (5). Refer to Procedure 011-076 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-011-076.html)

Install the aftertreatment outlet NOx sensor module (4) on the aftertreatment SCR catalyst temperature sensor interface module mounting bracket. Refer to Procedure 019-451 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-451.html)

Install the aftertreatment temperature sensor assembly (2). Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)

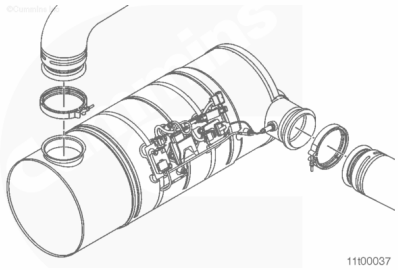
Install and connect the aftertreatment interface harness (1). Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)



Install

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



⚠ CAUTION ⚠

Do not use an air tool to tighten the V-band clamp. An air tool will damage the threads.

Place the aftertreatment SCR catalyst on the vehicle. Use the exhaust hangers to support the canister.

Align the catalyst in the same orientation as marked previously.

Note : Horizontal aftertreatment SCR catalysts incorporate a water drain hole in the outlet section of the canister. If a new horizontal aftertreatment SCR catalyst is being installed, make sure the drain hole is located toward the bottom of the installation, within ±10 degrees of the vertical axis.

Note : Where applicable install and tighten the full Marmon® clamps before the spherical Marmon® to account for misalignment in the aftertreatment system.

Apply a coat of anti-seize compound, Part Number 3824879, or equivalent, on the threads of the V-band clamp. Put a new gasket on the V-band connection of the aftertreatment SCR catalyst and install opposite of removal. Tighten the V-band and Torca™ clamps.

Tighten the V-Band and Torca™ clamps.

Torque Value:
V-band Clamp 14 n•m [124 in-lb]

Torque Value:
Torca™ Clamp 55 n•m [41 ft-lb]

Connect the OEM wiring to the aftertreatment interface harness.

Install the aftertreatment outlet NOx sensor probe. Refer to Procedure 019-451 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-451.html)

Tighten the exhaust hangers. See equipment manufacturer service information

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Start the engine. Check the system for leaks.
- Use INSITE™ electronic service tool to check for active fault codes.
- If buildups were present, complete a stationary regeneration to make sure any of the remaining DEF crystallization has been removed from the aftertreatment SCR catalyst.
- Continue to monitor for leaks at the exhaust joints.

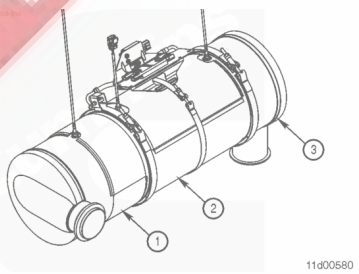
- No additional service items required.

General Information

⚠ WARNING ⚠

The material captured in a partial flow diesel particulate filter and/or a diesel particulate filter may contain elevated concentrations of metals. Primarily zinc, molybdenum, and possibly polynuclear aromatic hydrocarbons, that may be regulated. These materials must be characterized, handled, and disposed of according to applicable local regulations. In addition, due to the presence of the above-listed chemicals and other potentially toxic components such as oxides of calcium, zinc, phosphorous, silicon, sulfur, and iron, exhaust filter maintenance must be completed only by appropriately trained personnel.



11d00580

⚠ CAUTION ⚠

The aftertreatment diesel oxidation catalyst (DOC) elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system as damage to the aftertreatment DOC element can result.

Due to the number of exhaust aftertreatment applications, this document has been written to be generic. **Not** all illustrations within this document will represent the application being serviced.

The aftertreatment system is composed of four sections. These sections are:

- Aftertreatment DOC
- Aftertreatment diesel particulate filter (DPF)
- Decomposition reactor tube
- Selective catalytic reduction (SCR).

Note : The aftertreatment DOC is integrated into the inlet of the exhaust aftertreatment system. Use the following procedure for aftertreatment inlet service guidelines. Refer to Procedure 011-049 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-049.html)

Note : If the aftertreatment DPF is being replaced due to progressive damage from engine oil or fuel, clean the exhaust pipe from the turbocharger outlet to the aftertreatment DOC.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

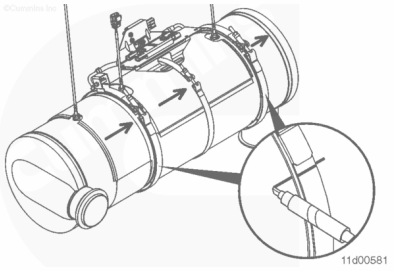
⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800 °C [1500°F], and exhaust system surface temperature can exceed 700 °C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the original equipment manufacturer (OEM) wiring harness from the aftertreatment interface harness. Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)

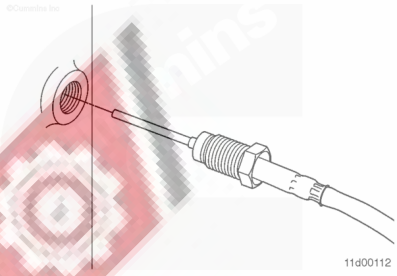
Remove

Draw an orientation reference line across each V-band clamp, aftertreatment canister sections, sensor mounting bracket strap, and connections points to the exhaust pipe. This aids in lining up sections and V-band clamps to their original orientation during installation.



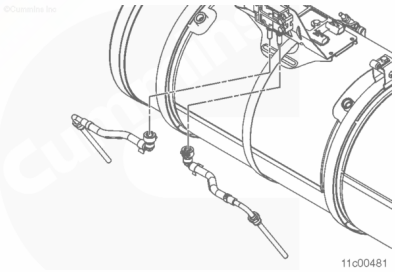
Remove the exhaust gas temperature sensor probes from the aftertreatment DOC and particulate filter. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)

Note : All three aftertreatment exhaust gas temperature sensor probes **must** be removed prior to aftertreatment DOC removal or damage to the sensor wiring and sensor probe will occur.



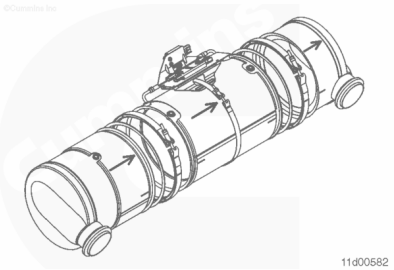
Remove the DPF differential pressure probes from the DPF inlet and outlet. Refer to Procedure 019-443 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-443.html)

Note : The DPF inlet and outlet differential pressure sensor tubes **must** be removed prior to aftertreatment DOC removal or damage to the sensor tube will occur.



⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



⚠ CAUTION ⚠

The aftertreatment DOC elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system as damage to the aftertreatment DOC element can result.

⚠ CAUTION ⚠

Do not use an air tool to remove the V-band clamp nut. An air tool will damage the threads. Apply thread lubricant to the V-band clamp threads prior to nut removal.

⚠ CAUTION ⚠

The DOC and DPF canister sections are an interlock design. The components must be separated by at least 51 mm [2 in] in the axial direction to allow enough clearance for the overlapping canister sections to not come into contact with each other as damage to the insulation and/or body joints can result.

Note : It can be necessary to remove additional mounting hardware to remove the aftertreatment DPF from the vehicle.

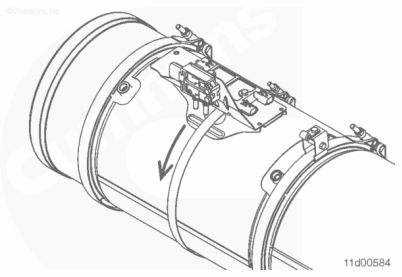
Remove the V-band clamps from the inlet and outlet flanges of the aftertreatment DPF.

Separate the flanges by approximately 45 mm [1.75 in] to allow removal over the gasket retainer rings.

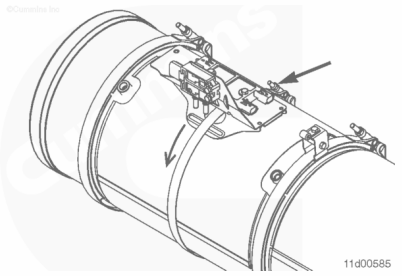
Remove and discard the gaskets.

Disassemble

Mark the direction of the aftertreatment DPF differential pressure sensor ports on the aftertreatment DPF canister. This will aid in installing the aftertreatment DPF differential pressure sensor mounting bracket in the correct orientation.



Remove the aftertreatment DPF sensor mounting bracket from the aftertreatment DPF. Refer to Procedure 011-046 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-046.html)

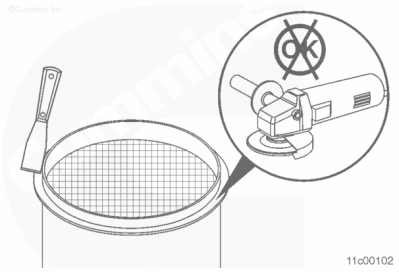


ANADOLU ISUZU DEALER SALES

Clean and Inspect for Reuse

⚠ CAUTION ⚠

Do not use a grinder to remove residual gasket material as this can damage the flange and cause the connection to leak.



⚠ CAUTION ⚠

Do not use an open flame to burn off soot accumulation from the face of the aftertreatment DPF.

⚠ CAUTION ⚠

Do not scrape off soot accumulation from the face of the aftertreatment DPF.

Note : The aftertreatment DPF relies on gas flow through the walls to collect soot. To accomplish gas flow through the walls of the aftertreatment DPF, every other cell on the face of the aftertreatment DPF is plugged with a ceramic material. Therefore, it is **not** possible to see light straight through the holes in the aftertreatment DPF.

Note : If the aftertreatment DPF is being replaced due to progressive damage from engine oil or excessive fuel, clean the tailpipe from the turbocharger outlet to the aftertreatment DOC. Refer to Procedure 011-049 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-049.html)

Remove any residual gasket material from the flanges on the aftertreatment DPF with a scraping tool.

Note : Avoid dropping fragments of gasket material into the aftertreatment DPF.

Refer to Service Bulletin, Aftertreatment Diesel Oxidation Catalyst and Aftertreatment Diesel Particulate Filter Reuse Guidelines, Bulletin 4021600 (/qs3/pubsys2/xml/en/bulletin/4021600.html), to inspect the inlet and outlet faces of the aftertreatment DPF for signs of damage.

Replace the aftertreatment particulate filter if damage is found.

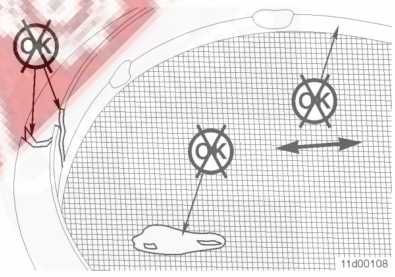
If the aftertreatment DPF has been removed for cleaning and is considered reusable (according to Service Bulletin,Aftertreatment Diesel Oxidation Catalyst and Aftertreatment Diesel Particulate Filter Reuse Guidelines, Bulletin 4021600 (/qs3/pubsys2/xml/en/bulletin/4021600.html)) the aftertreatment DPF can be cleaned with an aftertreatment particulate filter cleaning machine approved by Cummins Inc..

Note : If the aftertreatment DPF was removed due to Fault Code 1922 and is contaminated with coolant, it **must** be replaced with a new filter.

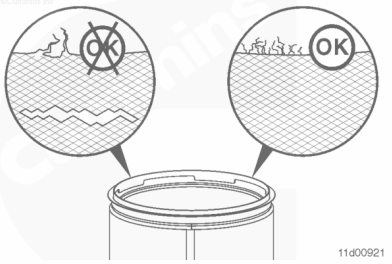
If the aftertreatment DPF has shifted, moved, or is loose inside the canister, replace the aftertreatment DPF.

If the aftertreatment DPF canister is cracked or otherwise damaged, replace the aftertreatment DPF.

Return the aftertreatment DPF section to a Cummins® Authorized Repair Location for cleaning, replacement, or exchange.



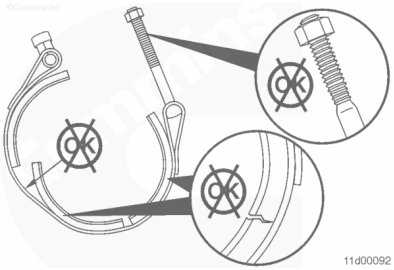
Inspect the DPF body joint insulation for visible wear at the diesel particulate filter inlet and outlet. Replace the DPF if excessive fraying or any cuts are observed.



Inspect the V-band clamps and mounting straps for signs of over-extension. The band **must not** be bent or damaged.

Inspect the V-band clamp and mounting strap threads for damage.

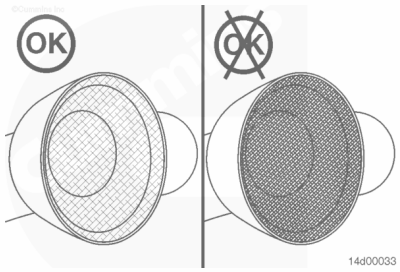
Replace the V-band clamp or strap if damage is found.



Note : The aftertreatment DPF is **not** 100 percent efficient. Some accumulation of exhaust residue/soot is normal and does **not** indicate a malfunctioning aftertreatment DPF.

A heavy buildup of exhaust residue/soot can indicate a malfunction of the aftertreatment DPF.

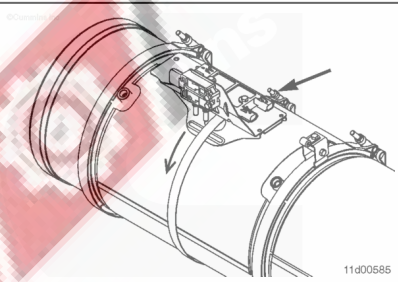
If the aftertreatment DPF is being replaced due to black smoke and the exhaust stack is found to have heavy black soot accumulation, clean the last 152 to 254 mm [6 to 10 in] of the exhaust system outlet.



Assemble

Install the aftertreatment DPF sensor mounting bracket onto the aftertreatment DPF. Refer to Procedure 011-046 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-046.html)

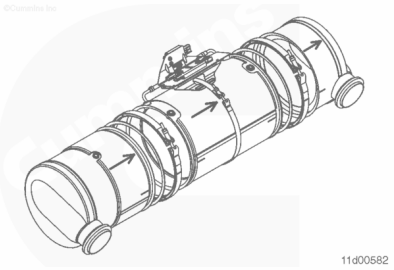
Note : If equipped with a DPF mounted aftertreatment DPF differential pressure sensor, make sure the aftertreatment system is oriented so the aftertreatment DPF differential pressure sensor is installed in the same orientation noted during disassembly.



Install

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



⚠ CAUTION ⚠

Do not use an air tool to tighten the V-band clamp. An air tool will damage the threads.

Install new gaskets on the inlet and outlet of the aftertreatment DPF canister.

Note : In some applications, a locating tab is integrated into the gasket retaining ring. The locating tab prevents the jointed aftertreatment DOC-

BURDOLU ISUZU DEALER SALES

aftertreatment V from being installed backwards and restricts the rotational orientation at which the filter can be installed.

Apply a coat of anti-seize compound to the threads of the V-band clamps.

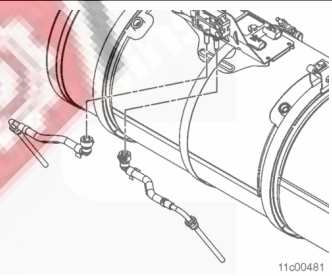
Install the aftertreatment DPF.

Loosely tighten the V-band clamps to allow rotation for final orientation of the differential pressure sensor tubes and exhaust gas temperature sensor probes.

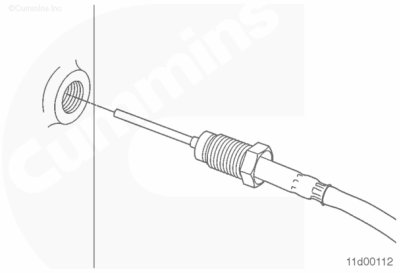
Tighten the V-band clamps.

Torque Value: 20 n•m [177 in-lb]

Install the aftertreatment DPF pressure sensor tubes into the aftertreatment DPF. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)

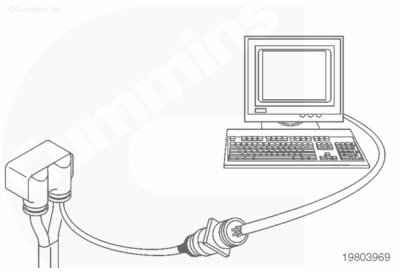


Install the exhaust gas temperature sensor probes into the aftertreatment DOC and particulate filter. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



Adjust

If the aftertreatment DPF was replaced for high soot loading or plugging, it will be necessary to reset the stored soot load in engine engine control module (ECM).



This can be performed by the following:

- Use INSITE™ electronic service tool to perform the Aftertreatment Maintenance Reset procedure under the ECM Diagnostic Test menu.

If the aftertreatment DPF was cleaned or replaced due to Fault Code 1922, it will be necessary to reset the stored soot load in the engine's ECM.

ANADOLU ISUZU
AFTER SALES

This can be performed by the following:

- Use INSITE™ electronic service tool to perform the Aftertreatment Maintenance Reset procedure under the Advanced ECM Data.
- Use INSITE™ electronic service tool or the in cab switch, if equipped, to perform a stationary regeneration. Refer to Procedure 014-016 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-016.html)

If the aftertreatment DPF is being replaced due to black smoke and the exhaust stack is found to have heavy black soot accumulation, perform a stationary regeneration to verify and finalize the repair. If any fault codes become active during a stationary regeneration, see the Fault Code Troubleshooting Manual.

Aftertreatment DPFs replaced with new filters will require the aftertreatment maintenance installation function in INSITE™ electronic service tool to be reset.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the vehicle on a dynamometer or perform a road test with the engine at rated load for a minimum of 5 minutes to make sure the aftertreatment system is performing properly. Refer to Procedure 014-016 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-016.html)
- Check for exhaust leaks and proper operation.

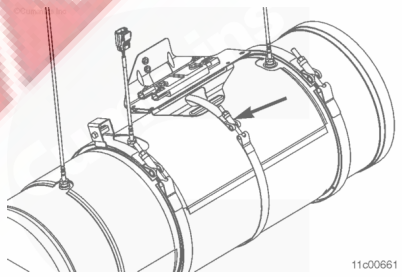
General Information

⚠ CAUTION ⚠

The catalyst elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system, as damage to the catalyst element can result.



Due to the number of exhaust aftertreatment applications, this procedure is generic. **Not** all illustrations within the procedure will represent all applications.

The exhaust aftertreatment system is composed of three sections:

1. Aftertreatment diesel oxidation catalyst
2. Aftertreatment diesel particulate filter
3. Outlet.

Note : In some applications, the aftertreatment diesel oxidation can be integrated into the inlet of the exhaust aftertreatment system. Use the following procedure for aftertreatment inlet service guidelines. Refer to Procedure 011-049 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-049.html)

Preparatory Steps

⚠ WARNING ⚠

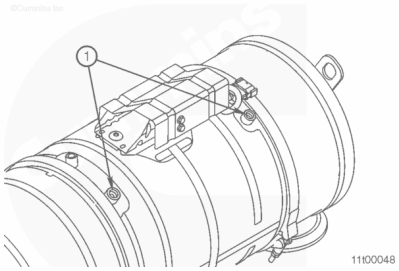
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

During regeneration, exhaust gas temperature could reach 800°C [1500°F], and exhaust system surface temperature could exceed 700°C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair. Make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the original equipment manufacturer (OEM) wiring harness from the aftertreatment interface harness. Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)
- Disconnect the aftertreatment interface harness from aftertreatment diesel particulate filter temperature sensor assembly. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)
- Disconnect the aftertreatment interface harness from the aftertreatment diesel particulate filter differential pressure sensor interface module. Refer to Procedure 019-443 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-443.html)
- Disconnect the aftertreatment diesel particulate filter differential pressure sensor tubes from the aftertreatment differential pressure sensor. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)

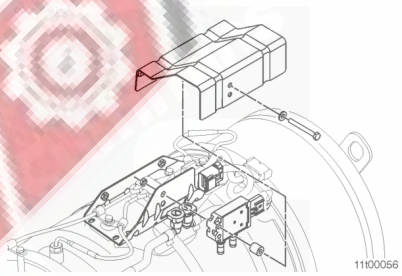
Mark the direction of the aftertreatment diesel particulate filter differential pressure sensor ports (1) on the aftertreatment diesel particulate filter canister.



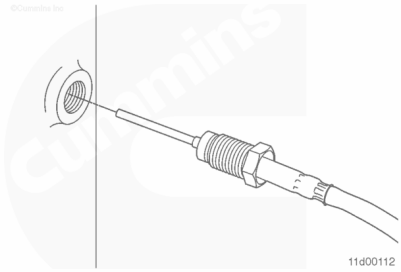
Disassemble

Remove the aftertreatment diesel particulate filter differential pressure sensor and heat shield, if equipped. Refer to Procedure 019-443 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-443.html)

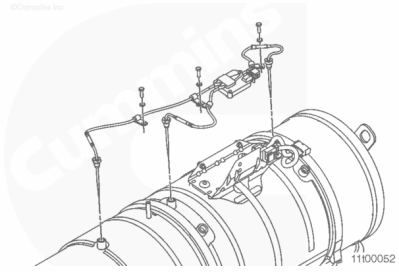
Note : The diesel particulate filter sensor table heat shield uses the same mounting bolts as the diesel particulate filter differential pressure sensor. There is a spacer located between the heat shield and diesel particulate filter differential pressure sensor. Note the location and orientation of this spacer during removal.



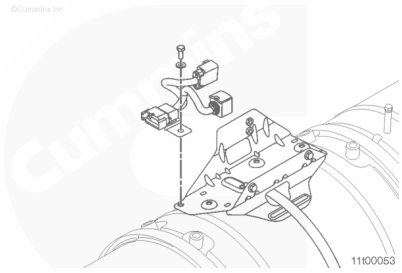
Remove the exhaust gas temperature sensor probes from the aftertreatment diesel oxidation catalyst and particulate filter. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



Remove the aftertreatment diesel particulate filter temperature sensor assembly. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



Remove the aftertreatment interface harness. Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)



Remove

⚠ CAUTION ⚠

Do not use an air tool to remove the band clamp nut. An air tool will damage the threads. Apply thread lubricant to the band clamp threads prior to nut removal.

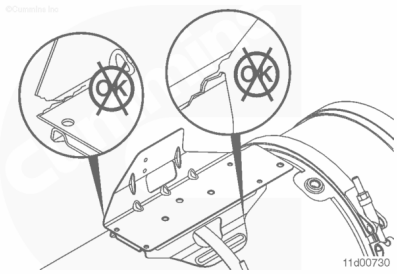
Remove the nut on the aftertreatment diesel particulate filter differential pressure sensor mounting bracket strap.

Remove the aftertreatment diesel particulate filter differential pressure sensor mounting bracket and strap.

Clean and Inspect for Reuse

Inspect the aftertreatment diesel particulate filter differential pressure sensor mounting bracket for cracks, damaged threads, or broken studs.

Replace the aftertreatment diesel particulate filter differential pressure sensor mounting bracket, if damaged.



Inspect the aftertreatment diesel particulate filter differential pressure sensor mounting bracket strap for cracks, damaged threads, or bends.

Replace the aftertreatment diesel particulate filter differential pressure sensor mounting bracket strap, if damaged.

ANADOLU ISUZU PARTS SALES

Install

⚠ CAUTION ⚠

The aftertreatment system must be installed so the aftertreatment diesel particulate filter differential pressure sensor tubes slope downward to drain condensation away from the aftertreatment diesel particulate filter differential pressure sensor.

⚠ CAUTION ⚠

Do not use an air tool to tighten the band clamp. An air tool will damage the threads.

Note : Make sure the aftertreatment system is oriented so the aftertreatment diesel particulate filter differential pressure sensor is installed in the same orientation noted during disassembly.

Install the aftertreatment diesel particulate filter differential pressure sensor mounting bracket and strap.

Apply a coating of anti-seize compound to the threads of the aftertreatment diesel particulate filter differential pressure sensor mounting bracket strap.

Install the nut on the aftertreatment diesel particulate filter differential pressure sensor mounting bracket strap. Do **not** tighten the nut at this time.

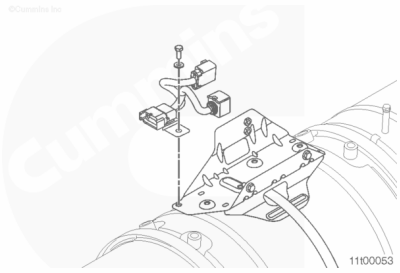
Connect the differential pressure sensor tubes to align the aftertreatment diesel particulate filter differential pressure sensor mounting bracket on the diesel particulate filter canister. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)

Tighten the aftertreatment diesel particulate filter differential pressure sensor mounting bracket strap.

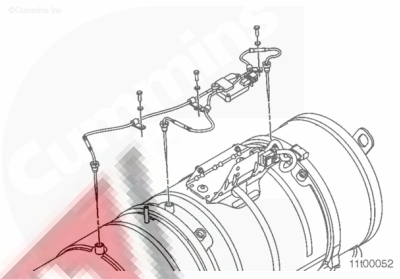
Torque Value: 7 n•m [62 in-lb]

Assemble

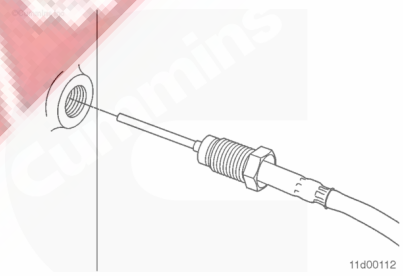
Install the aftertreatment interface harness. Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)



Install the aftertreatment diesel particulate filter temperature sensor assembly. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)

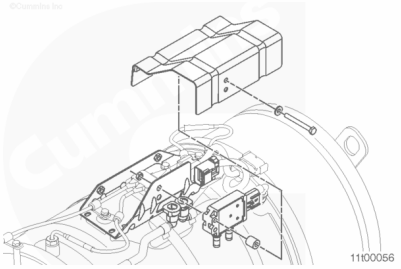


Install the exhaust gas temperature sensor probes to the aftertreatment diesel oxidation catalyst and particulate filter. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



Install the aftertreatment diesel particulate trap differential pressure sensor and heat shield, if equipped. Refer to Procedure 019-443 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-443.html)

Note : The diesel particulate filter sensor table heat shield use the same mounting bolts as the diesel particulate filter differential pressure sensor. There is a spacer located between the heat shield and diesel particulate filter differential pressure sensor. Note the location and orientation of this spacer during installation.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery

cable last.

- Connect the aftertreatment diesel particulate filter differential pressure sensor tubes to the aftertreatment differential pressure sensor. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)
- Connect the aftertreatment interface harness to the aftertreatment diesel particulate filter temperature sensor assembly. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)
- Connect the aftertreatment interface harness to the aftertreatment diesel particulate filter differential pressure sensor interface module. Refer to Procedure 019-443 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-443.html)
- Connect the OEM wiring harness to the aftertreatment interface harness. Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

General Information

⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800 °C [1500°F], and exhaust system surface temperature can exceed 700 °C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

⚠ WARNING ⚠

The material captured in a partial flow diesel particulate filter and/or a diesel particulate filter may contain elevated concentrations of metals. Primarily zinc, molybdenum, and possibly polynuclear aromatic hydrocarbons, that may be regulated. These materials must be characterized, handled, and disposed of according to applicable local regulations. In addition, due to the presence of the above-listed chemicals and other potentially toxic components such as oxides of calcium, zinc, phosphorous, silicon, sulfur, and iron, exhaust filter maintenance must be completed only by appropriately trained personnel.

The aftertreatment diesel particulate filter differential pressure sensor tubes connect the aftertreatment diesel particulate filter differential pressure sensor to the ports on the aftertreatment system. There are two aftertreatment diesel particulate filter differential pressure sensor tubes. One tube connects to the aftertreatment system upstream of the aftertreatment diesel particulate filter and the other connects downstream of the aftertreatment diesel particulate filter.

Due to the number of aftertreatment applications, this procedure is generic. **Not** all illustrations within the procedure will represent all applications.

Excessive carbon deposits inside the aftertreatment diesel particulate filter differential pressure sensor tubes can cause a CHECK ENGINE light.

Preparatory Steps

⚠ WARNING ⚠

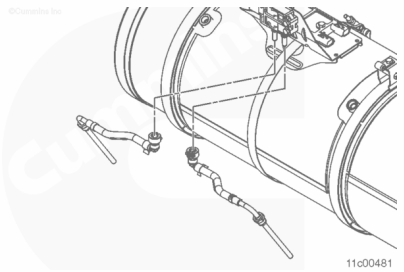
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the heat shield, if equipped. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Remove the differential pressure sensor tubes from the aftertreatment diesel particulate filter differential pressure sensor. Refer to Procedure 019-443 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-443.html)

Remove

⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800 °C [1500°F], and exhaust system surface temperature can exceed 700 °C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.



⚠ CAUTION ⚠

The aftertreatment diesel particulate filter differential sensor will not operate properly if the aftertreatment diesel particulate filter differential pressure sensor tubes are not connected to the correct port. Mark the aftertreatment diesel particulate filter differential pressure sensor tube connection port locations before disconnecting.

Note : The mounting location of the aftertreatment diesel particulate filter differential pressure sensor varies with exhaust aftertreatment orientation.

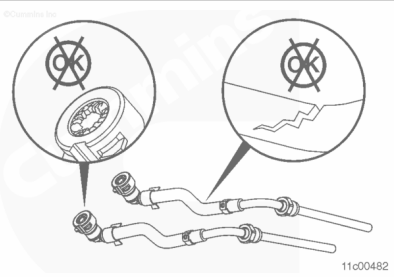
If equipped with a diesel particulate filter mounted aftertreatment differential pressure sensor:

- Loosen the aftertreatment diesel particulate filter differential pressure sensor tube nuts.
- Remove the P-clips or tube clamp mounting capscrews, if necessary.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Inspect the inside of the tube.

If the tube is partially clogged, saturate the inside of the tube with a mineral based solvent, or equivalent.

Carefully clean debris from the mouth of the tube, making sure **not** to damage the tube.

If the tube is fully clogged or otherwise unable to be cleaned, the tube **must** be replaced.

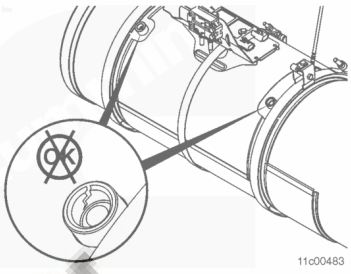
ANADOLU ISUZU PARTS SALES

Clean the tube. Use safety solvent. Dry the tube with compressed air.

Check the tube for cracks and thread damage. Replace the tube if damage is found.

Inspect the inside of the threaded bosses on the aftertreatment canister.

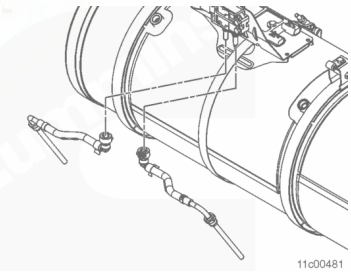
Clean debris from the inside of the threaded bosses, while being careful **not** to damage the threads.



Install

⚠ CAUTION ⚠

The aftertreatment diesel particulate filter differential sensor will not operate properly if the aftertreatment diesel particulate filter aftertreatment diesel particulate filter differential pressure sensor tubes are not connected to the correct port. Install the aftertreatment diesel particulate filter differential pressure sensor tubes as noted during disassembly.



⚠ CAUTION ⚠

The aftertreatment system must be installed so the aftertreatment diesel particulate filter differential pressure sensor tubes slope downward to drain condensation away from the aftertreatment diesel particulate filter differential pressure sensor.

Note : In vertical aftertreatment orientations, an aftertreatment diesel particulate filter differential pressure sensor tube support is present. Make sure the aftertreatment diesel particulate filter differential pressure tube is seated in the support clip.

Apply a coating of anti-seize compounds 3824397, 3824732, and 3824879, or equivalent, to the threads on the aftertreatment diesel particulate filter differential pressure sensor tubes prior to assembly. Do **not** allow Loctite® to

enter the inside of the aftertreatment diesel particulate filter differential pressure sensor tubes. This can cause a blockage.

Minimum Loctite® anti-seize temperature range specifications: 1600°C [870°C].

Install the aftertreatment diesel particulate filter differential pressure sensor tubes on the aftertreatment system.

Note : Make sure the aftertreatment diesel particulate filter differential pressure sensor tubes are **not** making contact with each other or any other vehicle components prior to tightening the aftertreatment diesel particulate filter differential pressure sensor tube nuts.

Tighten the upstream aftertreatment diesel particulate filter differential pressure sensor tube nut.

Torque Value: 31 n•m [23 ft-lb]

Tighten the downstream aftertreatment diesel particulate filter differential pressure sensor tube nut.

Torque Value: 17 n•m [150 in-lb]

If equipped with diesel particulate filter mounted aftertreatment differential pressure sensor:

- Install the P-clip or the tube clamp that holds the aftertreatment diesel particulate filter differential pressure sensor tube on the aftertreatment system, if necessary.

Torque Value: 14 n•m [124 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the quick disconnect fittings, and, if equipped, the aftertreatment diesel particulate filter differential pressure sensor insulation box and differential pressure sensor tubes to the aftertreatment diesel particulate filter differential pressure sensor.

ANADOLU ISUZU AFTER SALES

- Install of the differential pressure sensor tubes to the aftertreatment diesel particulate filter differential pressure sensor. Refer to Procedure 019-443 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-443.html)
- Install the heat shield, if equipped. Refer to Procedure 011-032 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-032.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the vehicle on a dynamometer or perform a road test with the engine at rated load for a minimum of 5 minutes to make sure the aftertreatment system is performing properly.
- Check for fault codes and exhaust leaks.

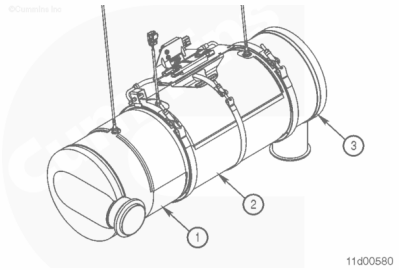
General Information

⚠ WARNING ⚠

The material captured in a partial flow diesel particulate filter and/or a diesel particulate filter may contain elevated concentrations of metals. Primarily zinc, molybdenum, and possibly polynuclear aromatic hydrocarbons, that may be regulated. These materials must be characterized, handled, and disposed of according to applicable local regulations. In addition, due to the presence of the above-listed chemicals and other potentially toxic components such as oxides of calcium, zinc, phosphorous, silicon, sulfur, and iron, exhaust filter maintenance must be completed only by appropriately trained personnel.



⚠ CAUTION ⚠

The aftertreatment diesel oxidation catalyst elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system as damage to the aftertreatment diesel oxidation catalyst element can result.

⚠ CAUTION ⚠

Do not steam clean the inlet of the diesel oxidation catalyst as damage to the aftertreatment diesel oxidation catalyst can result.

Due to number of exhaust aftertreatment applications, this procedure is generic. **Not** all illustrations within this procedure will represent all applications.

The exhaust aftertreatment is composed of three sections. These sections are:

1. Aftertreatment diesel oxidation catalyst
2. Aftertreatment diesel particulate filter
3. Outlet.

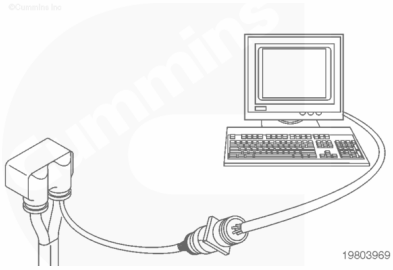
Note : The aftertreatment diesel oxidation catalyst is integrated into the inlet of the exhaust aftertreatment system.

Note : If the aftertreatment diesel particulate filter or aftertreatment diesel oxidation catalyst is being replaced due to progressive damage from engine oil or fuel, clean the tailpipe from the turbocharger outlet to the aftertreatment diesel oxidation catalyst.

Test

⚠ CAUTION ⚠

If an engine progressive damage malfunction has sent fuel or oil to the diesel particulate filter or the diesel oxidation, do not perform an Aftertreatment Diesel Particulate Filter Regeneration Test until the aftertreatment diesel oxidation catalyst and diesel particulate filter are inspected.



To test the diesel oxidation catalyst, use INSITE™ electronic service tool to perform the Aftertreatment Diesel Particulate Filter Regeneration Test. The efficiency of the diesel oxidation catalyst will be tested.

If a malfunction in the catalyst system is detected, fault codes will become active during the test. Follow the appropriate fault code troubleshooting tree.

ANADOLU EGZOZ FILTER SALES

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800 °C [1500°F], and exhaust system surface temperature can exceed 700 °C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

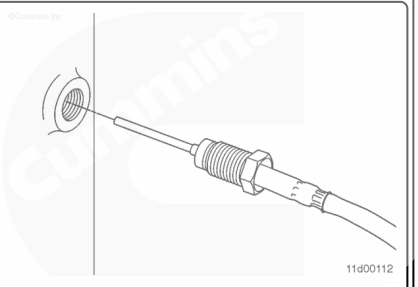
⚠ CAUTION ⚠

Aftertreatment diesel oxidation catalyst can remain hot for a long time after the engine has stopped.

- Disconnect the batteries. See equipment manufacturer service information.
- Disonnect the original equipment manufacturer (OEM) wiring harness from the aftertreatment interface harness. Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)

Disassemble

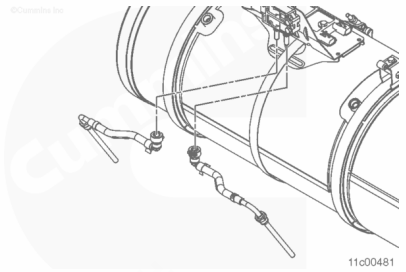
Remove the aftertreatment diesel oxidation catalyst intake temperature sensor probe and aftertreatment diesel particulate filter intake temperature sensor probes. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



Note : The aftertreatment diesel oxidation catalyst intake temperature sensor probe and aftertreatment

diesel particulate filter intake temperature sensor probe **must** be removed prior to aftertreatment diesel oxidation catalyst removal or damage to the sensor wiring and sensor probe will occur.

Remove the diesel particulate filter inlet differential pressure sensor tube from the diesel oxidation catalyst. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)

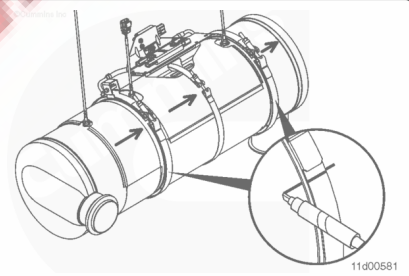


Note : The diesel particulate filter inlet differential pressure sensor tube **must** be removed prior to aftertreatment diesel oxidation catalyst removal or damage to the sensor tube will occur.

Remove

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



⚠ CAUTION ⚠

The aftertreatment diesel oxidation catalyst elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system as damage to the aftertreatment diesel oxidation catalyst element can result.

⚠ CAUTION ⚠

Do not use an air tool to remove the V-band clamp nut. An air tool will damage the threads. Apply thread lubricant to the V-band clamp threads prior to nut removal.

Draw an orientation reference line across each of the V-band clamps, aftertreatment canister sections, and connection points to the tailpipe. This will aid in linking up sections and V-band clamps to their original orientation during installation.

Note : If necessary, remove additional mounting hardware to remove the aftertreatment diesel oxidation catalyst from the vehicle or equipment.

Remove the V-Band clamps from the inlet and outlet of the aftertreatment diesel oxidation catalyst.

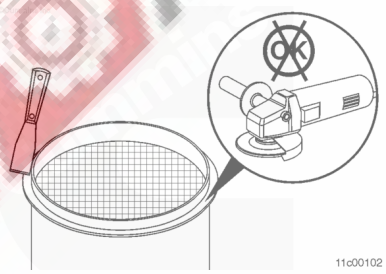
Separate the component sections by approximately 45 mm [1.75 in] to allow removal over the gasket retainer rings.

Remove and discard the gaskets.

Clean and Inspect for Reuse

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ CAUTION ⚠

Do not use a grinder or abrasive air tool to remove residual gasket material, as this can damage the flange and cause the connection to leak.

⚠ CAUTION ⚠

Do not use an open flame to burn off soot accumulation from the face of the aftertreatment diesel particulate filter.

⚠ CAUTION ⚠

Do not scrape off soot accumulation from the face of the aftertreatment diesel particulate filter.

⚠ CAUTION ⚠

Do not steam clean the inlet of the diesel oxidation catalyst as damage to the aftertreatment diesel oxidation catalyst can result.

ANADOLU ISUZU PARTS

Remove any residual gasket material from the flanges on the aftertreatment diesel particulate filter, diesel oxidation catalyst, and catalyst inlet. Use a putty knife.

Note : Avoid dropping fragments of gasket material into the aftertreatment diesel particulate filter and catalyst.

Inspect the exhaust gas temperature sensor boss threads for damage.

If thread damage is found on the exhaust gas temperature sensor boss threads, a helicoil **must** be used for repair.

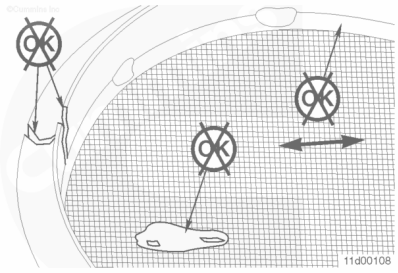
Note : If the aftertreatment diesel particulate filter is being inspected due to progressive damage that introduced engine oil or excessive fuel into the exhaust, inspect the tailpipe from the turbocharger outlet to the aftertreatment diesel oxidation catalyst.

If a trail of coolant can be seen exiting the turbocharger outlet, the diesel oxidation catalyst can be recovered without removing it for inspection. Refer to Procedure 014-015 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-015.html)

If a trail of coolant can be seen exiting the turbocharger outlet, the tailpipe between the turbocharger outlet and aftertreatment diesel oxidation catalyst **must** be cleaned. See equipment manufacturer service information.

If a trail of engine oil or fuel can be seen exiting the turbocharger outlet, the tailpipe between the turbocharger outlet and aftertreatment diesel oxidation catalyst **must** be cleaned. See equipment manufacturer service information.

If the aftertreatment diesel oxidation catalyst section has shifted, moved, or is loose inside the canister, replace the aftertreatment diesel oxidation catalyst section.

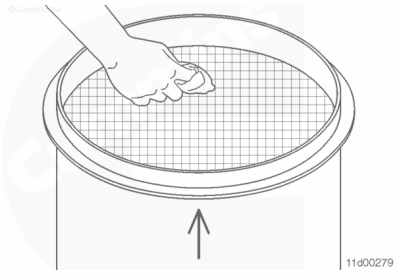


Refer to Service Bulletin, Aftertreatment Diesel Oxidation Catalyst and Aftertreatment Diesel Particulate Filter Reuse Guidelines, Bulletin 4021600 (/qs3/pubsys2/xml/en/bulletin/4021600.html), to inspect the inlet and outlet faces of the aftertreatment diesel oxidation catalyst for signs of damage.

Replace the aftertreatment diesel oxidation catalyst, if it is damaged.

⚠ WARNING ⚠

The material captured in a partial flow diesel particulate filter and/or a diesel particulate filter may contain elevated concentrations of metals. Primarily zinc, molybdenum, and possibly polynuclear aromatic hydrocarbons, that may be regulated. These materials must be characterized, handled, and disposed of according to applicable local regulations. In addition, due to the presence of the above-listed chemicals and other potentially toxic components such as oxides of calcium, zinc, phosphorous, silicon, sulfur, and iron, exhaust filter maintenance must be completed only by appropriately trained personnel.



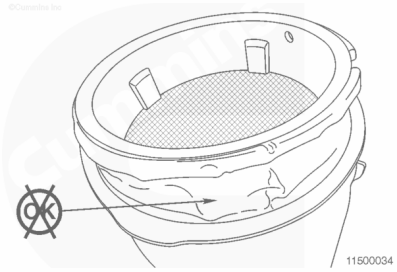
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Inspect the outlet of the aftertreatment diesel oxidation catalyst for loose debris and soot. Use a rag to wipe off any soot. Use a HEPA vacuum to remove any remaining loose debris.

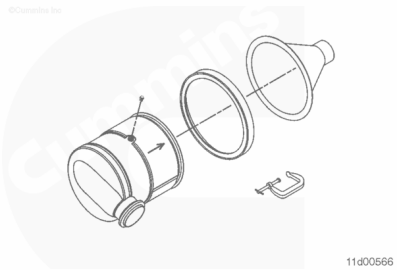
Note : Use a vacuum bag, such as a drywall dust bag, to capture the soot removed.

Inspect the aftertreatment diesel oxidation catalyst insulation for damage.



Attach aftertreatment diesel particulate filter cleaning machine cone, Part Number 4918850, to the outlet side of the aftertreatment diesel oxidation catalyst with adapter ring, Part Number 4918848. Evenly space four to five spring clamps or C-clamps around the circumference of the aftertreatment diesel oxidation catalyst to seal the cone and adapter ring to the aftertreatment diesel oxidation catalyst.

Diesel Catalyst Module Cleaning Kit, Part Number 4918877, contains the cones and rings needed for this procedure.



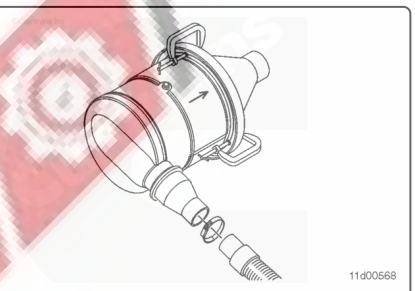
ANADOLU ISUZU AFTERSALES

Install threaded plastic plug, Part Number 4919495, into the exhaust gas temperature sensor port on the diesel oxidation catalyst. This will prevent air from escaping the diesel oxidation catalyst.

Obtain a 51 to 102 mm [2 to 4 in] rubber pipe reducer.

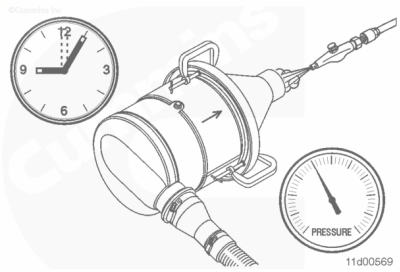
Attach the vacuum hose to the 51 mm [2”] end of the pipe reducer. Install the larger end of the reducer to the inlet of the diesel oxidation catalyst.

Use tape to seal any open ports.



⚠ CAUTION ⚠

Use only a rubber-tipped air gun near the catalyst material. Damage will result if a metal air gun strikes the catalyst material.



Adjust the air supply for a rubber-tipped air gun to 621 kPa [90 psi].

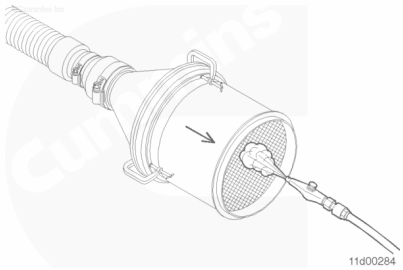
Switch on the vacuum. The vacuum and service tool kit is properly installed if the air flow through the aftertreatment diesel oxidation catalyst is opposite the exhaust flow. Exhaust flow is indicated by the arrow drawn on the canister of the diesel oxidation catalyst prior to removal.

Blow compressed air across the outlet face of the aftertreatment diesel oxidation catalyst for approximately 5 minutes.

After 5 minutes, remove the aftertreatment diesel particulate filter cleaning machine cone. Continue blowing compressed air into the outlet of the diesel oxidation catalyst for an additional 10 to 15 minutes. Maintain a 13 to 25 mm [1/2 to 1 in] distance between the air gun and diesel oxidation catalyst

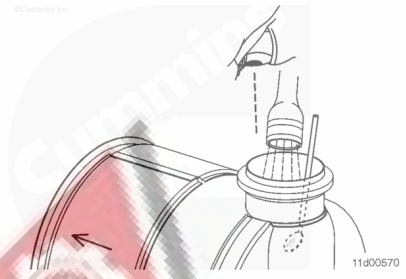
face. Use a sweeping motion across the entire face of the diesel oxidation catalyst. Attempt to blow air through every cell.

Allow the vacuum to operate for 1 minute after blowing out the aftertreatment diesel oxidation catalyst. After the vacuum is switched off, disconnect the cleaning machine cone. Inspect the cells of the diesel oxidation catalyst.



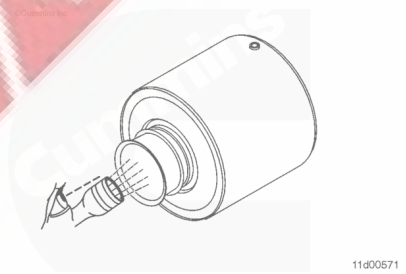
For side-in configurations:

Place an inspection mirror into the inlet of the diesel oxidation catalyst. Shine a flashlight on the mirror to inspect the cells of the inlet face.



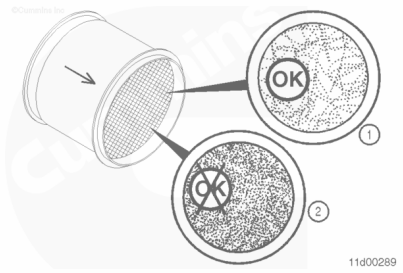
For end-in configurations:

Use a flashlight to inspect the inlet face of the diesel oxidation catalyst.



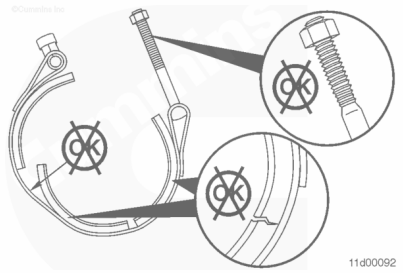
Upon inspection, if less than 50 percent of the cells are blocked (1) the aftertreatment diesel oxidation catalyst can be reused. If more than 50 percent of the cells remain blocked (2), repeat the cleaning procedure.

If fifty percent of the cells remain blocked after the second cleaning, replace the diesel oxidation catalyst.



Inspect the V-band clamps and aftertreatment diesel oxidation catalyst mounting straps for signs of overextension. The V-band **must not** be bent or otherwise damaged.

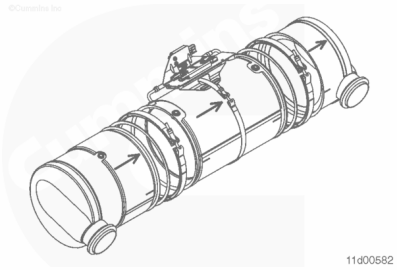
Replace the V-band clamps or aftertreatment diesel oxidation catalyst mounting straps if damage is found.



Install

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



⚠ CAUTION ⚠

Do not use an air tool to tighten the V-band clamp. An air tool will damage the threads.

Install new gaskets on the inlet and outlet of the exhaust gas aftertreatment diesel oxidation catalyst.

Apply a coat of anti-seize compound on the threads of the V-band clamps and Torca™ clamps.

Install the aftertreatment diesel oxidation catalyst.

Tighten the V-band clamp used to secure the aftertreatment diesel oxidation catalyst to the aftertreatment diesel particulate filter.

Torque Value: 20 n•m [177 in-lb]

Tighten the V-band clamp used to secure the inlet of the aftertreatment diesel oxidation catalyst to the exhaust pipe.

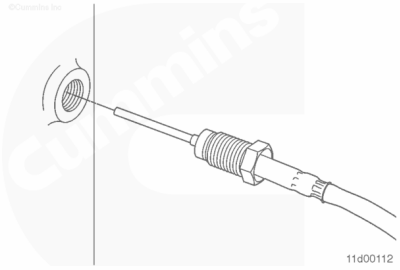
Torque Value: 13.5 n•m [120 in-lb]

If necessary, install any additional mounting hardware used to secure the aftertreatment diesel oxidation catalyst to the vehicle.

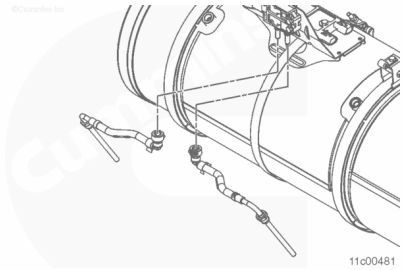
ANADOLU ISUZU GENUINE SALES

Assemble

Install the exhaust gas temperature sensor probes. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



Install the diesel particulate filter differential pressure sensor. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the OEM wiring harness to the aftertreatment interface harness. Refer to Procedure 019-477 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-477.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for fault codes and exhaust leaks.

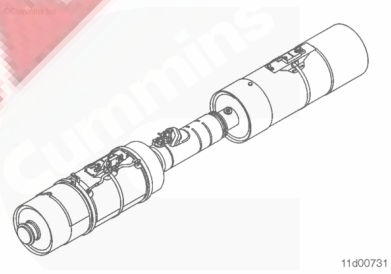
- No additional service items required.

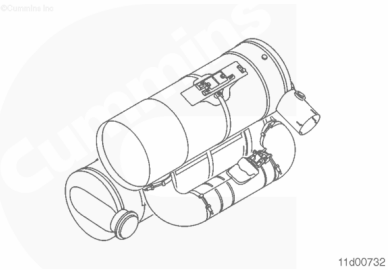
General Information

The aftertreatment system configuration will vary depending on the vehicle type and/or manufacturer. Some of the more common aftertreatment configurations are:

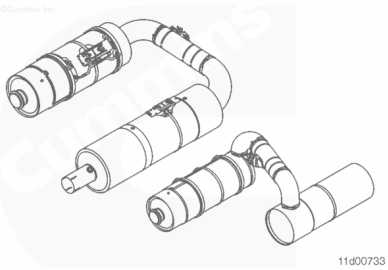
- Inline Horizontal - the selective catalytic reduction (SCR) assembly is aligned with and directly behind the diesel particulate filter assembly.



- Switchback - the diesel particulate filter and SCR assembly are side-by-side so the aftertreatment system can fit in a small area such as underneath the side steps of the vehicle.



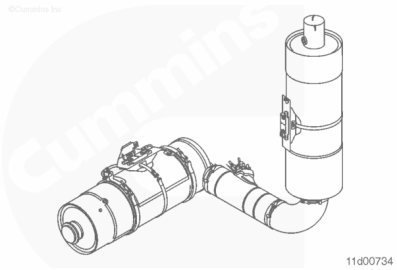
- Horizontal - the diesel particulate filter and SCR assemblies are on opposite sides of the chassis.
- Crossover - the diesel particulate filter and SCR assemblies are on opposite sides of the chassis.



- Horizontal to Vertical - the diesel particulate filter assembly is horizontal and then transitions to a vertical SCR assembly.

ANADOLU ISUZU AFTERSALES

Note : The illustration is depicting some common arrangements.



For some aftertreatment systems, if required, the entire aftertreatment system can be removed as a complete assembly. See equipment manufacturer service information.

In many cases the aftertreatment system **must** be removed component by component. See the appropriate procedures in the section for removal and installation information.

Use the following procedure for more detailed information about the aftertreatment system. Refer to Procedure 011-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-011-999.html)

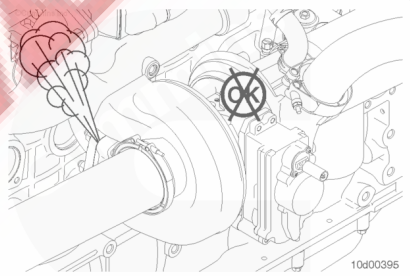
Additional Service Items

- Container suitable for diesel exhaust fluid (DEF)

General Information



The following procedure contains troubleshooting steps and information regarding the aftertreatment system.

Leaks in the exhaust system can cause exhaust odor or white smoke.

Inspect the exhaust piping for leaks, cracks, and loose connections. Refer to Procedure 010-024 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-024.html)

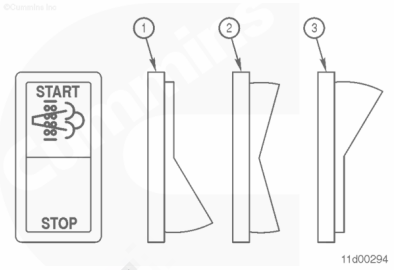
Tighten the exhaust clamps, if necessary. See equipment manufacturer service information for the correct torque value.

It can be necessary to perform a stationary (parked or non-mission) regeneration to locate exhaust leaks. Refer to Procedure 014-016 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-016.html)

The ambient temperature affects the length of time it will take to perform a stationary (parked or non-mission) regeneration because the engine **must** work harder to increase the exhaust temperatures to the appropriate levels in cold ambient temperatures.

In cold ambient temperatures (approximately -18°C [0°F] or colder), stationary (parked or non-mission) regeneration can take longer to complete. In extremely cold ambient temperatures, stationary (parked or non-mission) regeneration may **not** complete.

In these cases, it can be necessary to warm the engine to operating temperature before starting the stationary (parked or non-mission) regeneration, or to move the vehicle to a location with higher ambient temperatures.



The vehicle manufacturer has the option of installing two switches that control the aftertreatment function: the start switch and the permit switch.

The start switch (called the diesel exhaust fluid (DEF) Regeneration Start Switch in INSITE™ electronic service tool) is used to start a stationary regeneration. The vehicle manufacturer can also reference this switch as a "stationary (parked or non-mission) regeneration switch," "start switch," "non-mission regeneration switch", or "parked regeneration switch".

The permit switch (called the diesel particulate filter (DPF) Permit Switch in INSITE™ electronic service tool) is used to allow the operator to disable active regeneration, if necessary. The vehicle manufacturer can also reference this switch as an "inhibit switch," "stop switch," or "disable switch".

The start switch can be hardwired to the engine control module (ECM), or it can be multiplexed over J1939 multiplexing.

If the start switch is hardwired, it shares an ECM pin with the diagnostic switch. When the switch is turned ON and the engine is OFF, the ECM interprets this signal as the diagnostic switch. When the switch is turned ON and the engine is operating, the ECM interprets this signal as the start switch.

If the start switch is J1939-multiplexed, the signal for this switch is broadcast over the J1939 data link.

A J1939-multiplexed start switch signal has priority over a hardwired start switch signal. Therefore, if the start switch is enabled over J1939, the hardwired signal is ignored by the engine ECM.

The default setting for the start switch is OFF. If the start switch is enabled to INSITE™ electronic service tool, but no switch is installed (either hardwired or J1939-multiplexed), the switch status will remain OFF.

The position of the start switch can be monitored with INSITE™ electronic service tool in the Data Monitor/Logger screen.

The position of the permit switch can be monitored with INSITE™ electronic service tool in the Data Monitor/Logger screen.

The default setting for the permit switch is ON. If the permit switch is enabled in INSITE™ electronic service tool, but no switch is installed (either hardwired or J1939-multiplexed), the switch status will remain ON.

If the vehicle is operated for an extended period of time with the permit switch OFF, fault codes for the above normal levels of aftertreatment DEF soot load can result (Fault Codes 1921, 1922, and 2639).

If the aftertreatment DPF soot load reaches an above normal level (Fault Codes 1921, 1922, and 2639), and the permit switch is OFF, the ECM will log Fault Code 2777. The ECM will also log Fault Code 2777 if the ECM is requesting active regeneration of the aftertreatment and the permit switch is OFF.

If the permit switch is multiplexed, and therefore enabled, in the J1939 section of Features and Parameters in INSITE™ electronic service tool, it **must** also be enabled in the aftertreatment section of Features and Parameters in INSITE™ electronic service tool. If it is **not**, regeneration will be inhibited.

A J1939 multiplexed permit switch signal has priority over a hardwired permit switch signal, so if the permit switch is enabled over J1939, the hardwired signal is ignored by the engine ECM.

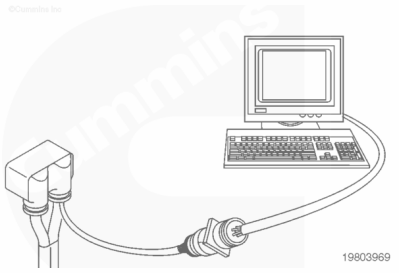
The position of the permit switch can be monitored with INSITE™ electronic service tool in the Data Monitor/Logger screen:

- When the permit switch is ON, active regeneration is allowed.
- When the permit switch is OFF, active regeneration is **not** allowed.

Note : If there is no permit switch installed and the permit switch is disabled in the J1939 section and the aftertreatment section of Features and Parameters in INSITE™ electronic service tool, the permit switch status in the Data Monitor/Logger screen will show the permit switch is OFF, but active regeneration will be allowed.

Note : This step describes possible incorrect aftertreatment exhaust gas temperature sensor wiring

conditions.

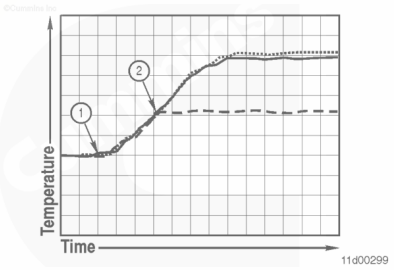


The aftertreatment sensors link to the ECM over J1939. See the appropriate Fault Code Troubleshooting Manual to diagnose and troubleshoot fault codes.

To verify the original equipment manufacturer (OEM) wiring harness and temperature sensors, use INSITE™ electronic service tool to monitor the following parameters with the engine operating. Verify they increase from room temperature.

- Aftertreatment diesel oxidation catalyst (DOC) intake temperature
- Aftertreatment DPF intake temperature
- Aftertreatment DPF outlet temperature
- Aftertreatment selective catalytic reduction (SCR) intake temperature
- Aftertreatment SCR outlet temperature.

If any of the parameters do **not** show a temperature as expected, check the aftertreatment wiring and connections to the sensor(s).



When performing a stationary (parked or non-mission) regeneration, monitor the exhaust temperatures in the aftertreatment to determine why a stationary (parked or non-mission) regeneration will **not** complete.

Possible causes for stationary (parked or non-mission) regenerations that will **not** complete include:

- Misassembled aftertreatment wiring harness
- A plugged aftertreatment DOC
- A malfunctioning turbocharger.

A normal stationary (parked or non-mission) regeneration will follow the pattern shown.

- The dashed line is for the aftertreatment DOC inlet temperature sensor.
- The dotted line is for the aftertreatment DPF inlet temperature sensor.
- The solid line is for the aftertreatment DPF outlet temperature sensor.

When the stationary (parked or non-mission) regeneration begins (1), all three temperatures should be approximately the same, and should increase at the same rate.

The wiring to the aftertreatment temperature sensors appears to be correct in this example because they all read approximately the same temperature at the beginning of the stationary (parked or non-mission) regeneration and increase at the same rate.

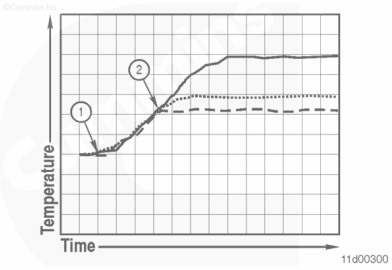
Aftertreatment injection begins when all three temperatures reach approximately 289°C [552°F] (2).

Once aftertreatment injection begins, the aftertreatment DOC inlet temperature can vary slightly, but will typically remain between 260 and 399°C [500 and 750°F].

The aftertreatment DPF inlet and outlet temperatures will increase to approximately 482 to 649°C [900 to 1200°F]. The temperatures can vary during the stationary (parked or non-mission) regeneration, as the amount of fuel injected during aftertreatment injection is changed to maintain a constant temperature.

The aftertreatment DPF inlet and outlet temperatures will remain at this temperature for the duration of the stationary (parked or non-mission) regeneration.

This graph illustrates a stationary (parked or non-mission) regeneration where the inlet of the aftertreatment DOC is blocked.



- The dashed line is for the aftertreatment DOC inlet temperature sensor.
- The dotted line is for the aftertreatment DPF inlet temperature sensor.
- The solid line is for the aftertreatment DPF outlet temperature sensor.

In this condition, the engine speed will increase to the stationary (parked or non-mission) regeneration speed of 1000 to 1100 rpm.

Raising the aftertreatment temperature to the aftertreatment injection temperature can take longer to complete than normal, if the inlet to the aftertreatment DOC is plugged, restricting some of the exhaust flow.

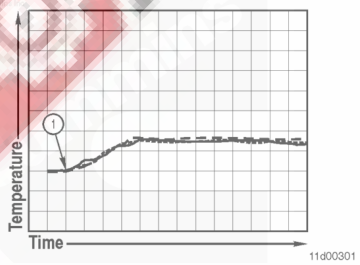
Once aftertreatment injection begins (2), the aftertreatment DPF inlet and outlet temperatures will differ greatly, due to the plugged aftertreatment DOC being unable to oxidize the injected fuel. The aftertreatment DPF has some capability to oxidize the injected fuel, but can **not** maintain this condition

without damaging the filter material over time. It is possible white smoke would be present from the vehicle tailpipe during this condition.

The wiring to the aftertreatment temperature sensors appears to be correct in this example because they all read approximately the same temperature at the beginning of the stationary (parked or non-mission) regeneration, and they increase at the same rate.

The possible cause of this condition is a plugged aftertreatment DOC. Use the following procedure to inspect the aftertreatment DOC. Refer to Procedure 011-049 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-049.html)

This graph illustrates a stationary (parked or non-mission) regeneration where the engine can **not** build enough heat to start aftertreatment injection.



- The dashed line is for the aftertreatment DOC inlet temperature sensor.
- The dotted line is for the aftertreatment DPF inlet temperature sensor.
- The solid line is for the aftertreatment DPF outlet temperature sensor.

The engine speed will likely increase to the stationary (parked or non-mission) regeneration speed of 1000 to 1100 rpm, but because the aftertreatment temperatures do **not** increase enough to start aftertreatment injection, the stationary (parked or non-mission) regeneration will **not** complete.

The wiring to the aftertreatment temperature sensor appears to be correct in this example because they all read approximately the same temperature for the same conditions.

Possible causes of this issue include:

- A malfunctioning turbocharger. Use the following procedure to verify the turbocharger sector gear has full travel. Refer to Procedure 010-134 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-134.html)
- Low ambient temperatures. Move the vehicle to a location with higher ambient temperatures.

This graph illustrates a stationary (parked or non-mission) regeneration where the wiring to the aftertreatment temperature sensors is incorrect.

- The dashed line is for the aftertreatment DOC inlet temperature sensor.
- The dotted line is for the aftertreatment DPF inlet temperature sensor.
- The solid line is for the aftertreatment DPF outlet temperature sensor.

In this condition, the engine speed will increase to the stationary (parked or non-mission) regeneration speed of 1000 to 1100 rpm.

Aftertreatment injection will **not** occur in this condition because the aftertreatment DOC inlet temperature does **not** reach the required temperature. Because aftertreatment injection is **not** occurring, the aftertreatment temperatures should **not** read differently.

The possible cause of this condition is an incorrectly assembled aftertreatment wiring harness. See the aftertreatment exhaust gas temperature sensor wiring section of this procedure.

This graph illustrates a stationary (parked or non-mission) regeneration where the OEM wiring to the aftertreatment DOC inlet temperature sensor and the aftertreatment DPF outlet temperature sensor are reversed.

- The dashed line is for the aftertreatment DOC inlet temperature sensor.
- The dotted line is for the aftertreatment DPF inlet temperature sensor.
- The solid line is for the aftertreatment DPF outlet temperature sensor.

In this condition, the engine speed will increase to the stationary regeneration speed of 1000 to 1100 rpm.

Aftertreatment injection can occur in this condition (2). However, the aftertreatment DOC inlet temperature increases after aftertreatment injection begins, while the aftertreatment DPF outlet temperature remains constant.

The possible cause of this condition is the connectors to the aftertreatment DOC inlet temperature sensor and aftertreatment DPF outlet temperature sensor are reversed. See the aftertreatment exhaust gas temperature sensor wiring section of this procedure.

Test

⚠ WARNING ⚠

Diesel exhaust fluid (DEF) contains urea. Do not get the substance in your eyes. In case of contact, immediately flush eyes with large amounts of water for a minimum of 15 minutes. Do not swallow. In the event the DEF is ingested, contact a physician immediately. Reference the materials safety data sheet (MSDS) for additional information.

⚠ CAUTION ⚠

It is unlawful to tamper with or remove any component of the aftertreatment system. It is also unlawful to use a DEF that does not meet the specifications provided, or to operate the vehicle/equipment with no DEF.

⚠ CAUTION ⚠

Never add water or any other fluid besides what is specified to the DEF tank. The aftertreatment system may be damaged.

Note : This section of the procedure provides information for testing the DEF concentration.

The correct concentration of DEF is critical to the engine and aftertreatment system for correct performance.

Cummins Inc. is **not** responsible for malfunctions or damage resulting from what Cummins Inc. determines to be abuse or neglect. This includes, but is **not** limited to: operation without correctly specified DEF, lack of maintenance of the aftertreatment system, improper storage or shutdown practices, or unauthorized modifications of the engine and aftertreatment system. Cummins Inc. is also **not** responsible for malfunctions caused by incorrect DEF, water, dirt, or other contaminants in the DEF. Use DEF refractometer, Part Number 4919554, to test the concentration of the DEF. Follow the instructions provided with the service tool.

The concentration of the DEF **must** be 32.5 ±0.7 percent.

If the DEF concentration does **not** meet this specification, drain the DEF tank, flush the tank with distilled water, and fill the tank with known good DEF. Check the DEF concentration.

Concentration of the DEF should be checked when:

- The vehicle has been stored for an extended period of time.
- It is suspected water has been added to the DEF tank.

Contamination/Incorrect Fluid

DEF can become contaminated by the following situations:

- If equipped, the aftertreatment DEF tank coolant heating systems malfunctions, allowing coolant to mix with the DEF.
- The aftertreatment DEF tank cap is missing/damaged or the tank vent malfunctions.
- The aftertreatment DEF tank is filled with the incorrect fluid.

In the event the DEF becomes contaminated, inspect the DEF to determine the most likely source.

Obtain a sample from the DEF tank and pour into an appropriate container. Make sure to get a sample from the highest fluid level.

Petroleum base liquids, such as, but **not** limited to:

- Diesel fuel
- Hydraulic fluid
- Brake fluid.

DEF is largely composed of water. Petroleum based liquids will separate from the DEF and rise to the top. Check for separation of the fluids as well as characteristic smells.

If the DEF is contaminated, see the steps in this section.

Non-petroleum base liquids, such as, but **not** limited to:

- Water
- Coolant
- Windshield washer fluid.

If water has been added, the DEF will remain clear. As a result, the DEF will become diluted, reducing the concentration level.

Note : If **only** water has been added to the DEF tank, drain the DEF tank, flush with distilled water, and refill with new and/or known good DEF. Check the DEF concentration after completing the refill. See the Test section in this procedure.

For other non-petroleum based liquids added to the DEF, typically those fluids have coloring and will mix with DEF. If the DEF has a color tint to it, look for other fluids used on the vehicle that can match, such as coolant or windshield washer fluid.

If the DEF is contaminated, see the steps in this section.

Note : Use INSITE™ electronic service tool to view and troubleshoot any fault codes that occur during the following steps. See the appropriate Fault Code Troubleshooting Manual. Refer to Procedure 205-001 in Section L. (/qs3/pubsys2/xml/en/procedures/425/425-205-001.html)

Use the following procedure if the DEF has been contaminated. Remove the aftertreatment DEF dosing unit filter. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

If the contaminated fluid **did not** go through the dosing system, drain the DEF tank, flush with distilled water, and replace the DEF in-tank filter. See equipment manufacturer service information for specific information on servicing the DEF tank.

After the DEF tank has been cleaned, refill with known good DEF. Check the DEF concentration after completing the refill. See the Test section in this procedure.

Note : Any discarded contaminated fluids and/or parts should be disposed of according to local area ordinances.

If the contaminated fluid did go through the dosing system:

1. Drain the DEF tank, flush with several fills of water until it is clean and clear of contamination. Replace the DEF in the tank filter. See equipment manufacturer service

information for specific information on servicing the DEF tank.

2. Replace the aftertreatment DEF dosing unit filter. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)
3. Remove all of the aftertreatment DEF lines. Flush with distilled water. See equipment manufacturer service information on the handling of contaminants in the aftertreatment DEF lines. Install the aftertreatment DEF lines.
4. Fill the aftertreatment DEF tank with distilled water.
5. Perform the INSITE™ electronic service tool DEF Doser Pump Override Test. Repeat the test until the distilled water runs clear.
6. Drain the distilled water from the DEF tank and refill with known good DEF. Check the DEF concentration. Follow the instructions in the Test section of this procedure.
7. Replace the aftertreatment DEF dosing unit filter again. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)
8. Perform the INSITE™ electronic service tool DEF Doser Pump Override Test. Test the performance and spray pattern of the aftertreatment DEF dosing valve.
9. Perform a stationary (parked or non-mission) regeneration. Refer to Procedure 014-016 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-016.html)
10. Road test the vehicle for 30 minutes to verify system operation.

ANADOLU ISUZU

Last Modified: 01-Nov-2016

Select Service Tools

Recommended Cummins® Service Tools

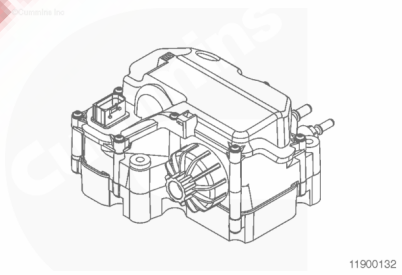
- Fluid Doser Cleaner Kit, Part Number 5298533

Additional Service Items

- Container suitable for diesel exhaust fluid (DEF)
- Soft bristle brush
- Rubber tipped air gun

General Information

The aftertreatment DEF dosing unit draws DEF from the aftertreatment DEF tank, pressurizes the DEF, and delivers the DEF to the aftertreatment DEF dosing valve. Any unused DEF is routed back to the aftertreatment DEF tank. Use the following procedure for further information on the aftertreatment DEF dosing system. Refer to Procedure 011-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-011-999.html)



11900132

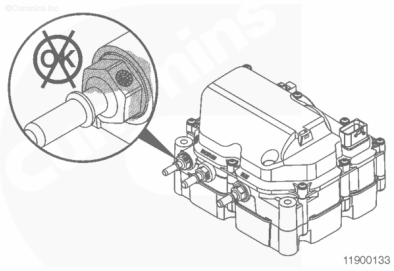
Use the following procedure for information on handling incorrect or contaminated diesel exhaust fluid. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)

Note : There are 12 volt and 24 volt versions of the DEF dosing unit. The voltage rating is stamped into the housing of the aftertreatment DEF dosing unit, next to the electrical connection. The aftertreatment DEF dosing unit can also be distinguished by the connector. If the face of the electrical connector on the electrical harness is gray, it is a 24 volt unit. If it is black, it is 12 volt unit. The electrical connectors are keyed differently and are **not** interchangeable.

Note : The aftertreatment DEF dosing unit has a serviceable filter. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

Initial Check

Note : Do **not** disconnect the vehicle batteries until the DEF dosing system has completed the purge cycle. Before beginning to remove and/or disconnect any components, wait at least five minutes after the keyswitch is turned OFF for the aftertreatment DEF dosing system to purge the DEF from the system. The purge cycle is an automatic process and does **not** require an intervention to occur. The aftertreatment DEF dosing unit will issue an audible pumping noise during the purging process.



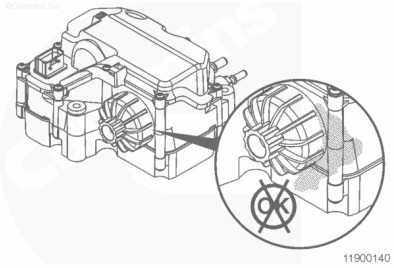
11900133

Check the DEF lines to and from the dosing unit for signs of leakage. DEF forms a white deposit around leaky fittings.

If white deposits are found, inspect the DEF line connection fittings for damage. See equipment manufacturer service information.

Check around the aftertreatment DEF dosing unit filter cap for white deposits.

See the Clean and Inspect for Reuse section of this procedure if leaks are visible from the aftertreatment DEF dosing unit line connectors or the filter cap.



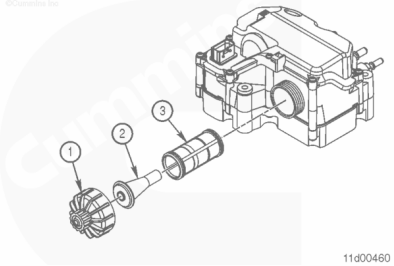
11900140

Test

In-Chassis Non Air Flush

Remove the aftertreatment DEF dosing unit filter. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

Do **not** install the new filter or DEF filter cap at this time.

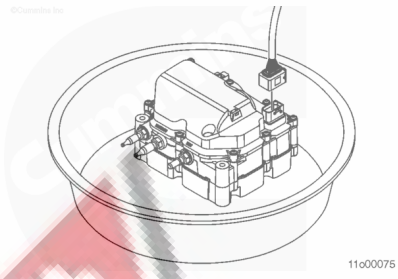


11d00460

ANADOLU ISUZU AFTER SALES

If **not** completed, clean the DEF tank thoroughly. Fill with certified DEF. See equipment manufacturer service information.

Position a collection container under the aftertreatment DEF dosing unit.



Note : Use distilled water if available. Make sure the filled fluid doser cleaner bottle is free of debris.

Fill the fluid doser cleaner bottle from Fluid Doser Cleaner Kit, Part Number 5298533, with clean water. Connect it to the aftertreatment DEF dosing unit inlet line connector.

Use INSITE™ electronic service tool DEF Doser Pump Override Test found, under Engine Control Module (ECM) Diagnostic Tests, to flush clean water through the aftertreatment DEF dosing unit. Refer to Procedure 011-063 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-063.html)

Follow the on-screen instructions to perform the test.

Note : Only the fluid doser cleaner bottle and 12 pin electrical connector are to be connected to the aftertreatment DEF dosing unit during this time.

Start the DEF Doser Pump Override Test.

Squeeze the fluid doser cleaner bottle gently to push water into the aftertreatment DEF dosing unit. The water will flow out from the DEF filter cap cavity.

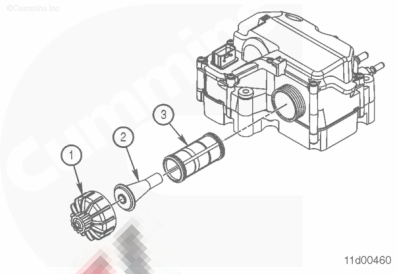
Repeat the procedure until the DEF dosing unit begins drawing fluid from the fluid doser cleaner bottle on its own.

The fluid doser cleaner bottle will start to collapse as the dosing unit starts drawing the fluid on its own. Once the aftertreatment DEF dosing unit is drawing fluid from the fluid

doser cleaner bottle on its own, press the stop button on INSITE™ electronic service tool to stop the test.

Note : If the DEF dosing unit does **not** begin drawing fluid after three full bottles, replace the DEF dosing unit.

Note : If the DEF dosing unit has been replaced, skip this step.



11d00460

Install an aftertreatment DEF dosing unit filter element. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

Note : Lubrication of the DEF filter o-rings is **not** required.

1. Slide the DEF filter equalizing element into the DEF filter cartridge.
2. Insert the assembly into the aftertreatment DEF dosing unit.
3. Install and tighten the cap.

Torque Value: 20 n•m [177 in-lb]

Connect the DEF lines to the aftertreatment DEF dosing unit in the following order to reduce the possibility of contamination of the electrical connector.

1. Backflow - DEF return to the DEF tank
2. Inlet - DEF supply to the aftertreatment DEF dosing unit
3. Outlet - DEF supply to the aftertreatment DEF dosing valve.

The DEF lines will snap when locked into place.

Lightly tug on the connectors to make sure they are secured.

Note : If the DEF dosing unit has been replaced, skip this step.

ck800wa

Perform the Aftertreatment DEF Dosing Unit Override Test to verify operation. Refer to Procedure 011-063 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-063.html)

If the measured volume of the aftertreatment DEF dosing unit is within specification, install the DEF dosing unit.

Out-of-Chassis Non Air Flush

Note : Make sure to prevent DEF from contaminating the electrical connector.

Remove the aftertreatment DEF dosing unit.

Thoroughly clean the aftertreatment DEF dosing unit.

Note : Remove the connector carefully to prevent debris from entering the inlet connector cavity.

Note : Make sure the o-ring is attached to the connector and is **not** stuck inside the DEF dosing unit.

Remove the DEF inlet connector.

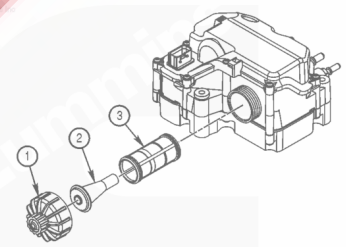
Discard the DEF inlet connector.

Install a new inlet connector. Lubricant is **not** required.

Torque Value: 4.5 n•m [40 in-lb]

Remove the aftertreatment DEF dosing unit filter element. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

Do **NOT** install the new filter or install the DEF filter cap at this time.



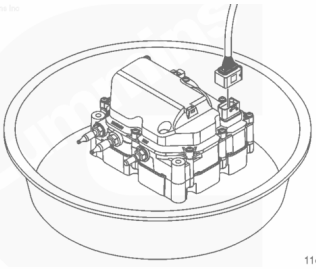
11d00460

If **not** completed, clean the DEF tank thoroughly. Fill with certified DEF. See equipment manufacturer service information.

ck800wa

⚠ CAUTION ⚠

Make sure to support the aftertreatment DEF dosing unit so the unit is not suspended by the electrical connector.



11c00075

Note : Make sure the electrical connections are clean and dry before installing.

Connect the 12 pin electrical connector on the aftertreatment DEF dosing unit.

ANADOLU ISUZU AFTER SALES

Position a collection container under the aftertreatment DEF dosing unit.

Note : Use distilled water if available. Make sure the filled fluid doser cleaner bottle is free of debris.

Fill the fluid doser cleaner bottle from the Fluid Doser Cleaner Kit, Part Number 5298533, with clean water. Connect it to the aftertreatment DEF dosing unit inlet line connector.

Use INSITE™ electronic service tool DEF Doser Pump Override Test, found under ECM Diagnostic Tests, to flush clean water through the aftertreatment DEF dosing unit. Refer to Procedure 011-063 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-063.html)

Follow the on-screen instructions to perform the test.

Note : Only the fluid doser cleaner bottle and 12 pin electrical connector are to be connected to the aftertreatment DEF dosing unit during this time.

Start the DEF Doser Pump Override Test.

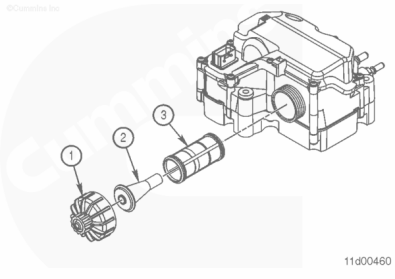
Squeeze the fluid doser cleaner bottle gently to push water into the aftertreatment DEF dosing unit. The water will flow out from the DEF filter cap cavity.

Repeat the procedure until the DEF dosing unit begins drawing fluid from the fluid doser cleaner bottle on its own.

The fluid doser cleaner bottle will start to collapse as the dosing unit starts drawing the fluid on its own. Once the aftertreatment DEF dosing unit is drawing fluid from the fluid doser cleaner bottle on its own, press the stop button on INSITE™ electronic service tool to stop the test.

Note : If the DEF dosing unit does **not** begin drawing fluid after three full bottles, replace the DEF dosing unit.

Note : If the DEF dosing unit has been replaced, skip this step.



Install a new aftertreatment DEF dosing unit filter element. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

Note : Lubrication of the DEF filter o-rings is **not** required.

1. Slide the DEF filter equalizing element into the DEF filter cartridge.
2. Insert the assembly into the aftertreatement DEF dosing unit.
3. Install and tighten the cap.

Torque Value: 20 n•m [177 in-lb]

Connect the DEF lines to the aftertreatment DEF dosing unit in the following order to reduce the possibility of contamination of the electrical connector.

1. Backflow - DEF return to the DEF tank.
2. Inlet - DEF supply to the aftertreatment DEF dosing unit.
3. Outlet - DEF supply to the aftertreatment DEF dosing valve.

The DEF lines will snap when locked into place.

Lightly tug on the connectors to make sure they are secured.

Note : Do **not** mount the aftertreatment DEF dosing unit to the original equipment manufacturer (OEM) mounting bracket at this time.

Note : If the DEF dosing unit has been replaced, skip this step.

Perform the Aftertreatment DEF Dosing Unit Override Test to verify operation. Refer to Procedure 011-063 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-063.html)

If the measured volume of the aftertreatment DEF dosing unit is within specification, install the DEF dosing unit.

Preparatory Steps

⚠ WARNING ⚠

DEF contains urea. Do not get the substance in your eyes. In case of contact, immediately flush eyes with large amounts of water for a minimum of 15 minutes. Do not swallow. In the event the DEF is ingested, contact a physician immediately. Reference the materials safety data sheet (MSDS) for additional information.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

The DEF line connecting the aftertreatment DEF dosing unit tank to the aftertreatment DEF dosing unit is under low pressure and should not be disconnected while the engine is running or before the system has completed the purge process after engine shutdown. Disconnecting the DEF line while under low pressure could cause DEF to spray.

Note : Do **not** disconnect the vehicle batteries until the DEF dosing system has completed the purge cycle. Before beginning to remove and/or disconnect any components, wait at least 5 minutes after the keyswitch is turned OFF for the aftertreatment DEF dosing system to purge the DEF from the system. The purge cycle is an automatic process and does **not** require an intervention to occur. The aftertreatment DEF dosing unit will issue an audible pumping noise during the purging process.

Note : Do **not** pressure wash or steam clean this unit. Use compressed air to remove **any** loose debris.

- Disconnect the batteries. See equipment manufacturer service information.

Note : The DEF lines are connected to the dosing unit by quick release fittings that could vary among vehicle manufacturers. See equipment manufacturer service information for the detailed removal process.

- Label and mark each DEF line and its mating connector for the aftertreatment dosing unit. If the lines are

connected incorrectly, the system will **not** function properly and will light a fault lamp.

- Disconnect the DEF lines and electrical connector in the following order to reduce the possibility of accidental DEF contamination of the electrical connector:

1. Backflow: DEF return to the DEF tank
2. Inlet: DEF supply to the aftertreatment DEF dosing unit
3. Outlet: DEF supply to the aftertreatment DEF dosing valve
4. 12 pin electrical connector.

The 12 pin electrical connector can be removed by sliding the yellow portion of the connector outward. The connector will then begin to rise and disconnect from the DEF supply module.

- Cap the DEF and electrical connectors of the aftertreatment DEF dosing unit to prevent contamination and DEF leakage.

Remove

Remove the three mounting capscrews.

Remove the aftertreatment DEF dosing unit.

Disassemble

Note : The aftertreatment DEF dosing unit should **only** be disassembled if a symptom has been identified that indicates further investigation is required.

Remove the DEF connector(s). Make sure the o-ring(s) are attached to the connector(s) and are **not** stuck inside the DEF dosing unit.

Clean and Inspect for Reuse

ANADOLU ISUZU AFTER SALES

Install the protective caps from Fluid Doser Cleaner Kit, Part Number 5298533, on the fluid connector(s) and the electrical connector on the aftertreatment DEF dosing unit.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Note : This unit is not serviceable. Do not open the case. Return the unit to a Cummins® Authorized Repair Location.

Do **not** immerse the unit in any kind of solution.

Do **not** wash with any detergents.

Clean the aftertreatment DEF dosing unit. Use **only** warm water and a soft bristled brush.

Thoroughly clean the areas surrounding the backflow connector, inlet connector, outlet connector, and main filter cap.

Note : Make sure the protective caps remain on the DEF dosing unit electrical connection, backflow, inlet, and outlet connectors to prevent contamination.

Note : If damage or corrosion is found, also inspect the DEF line connection. See equipment manufacturer service information.

Inspect the outside of the unit. If there are any cracks or other damage to the exterior of the case or electrical connectors, replace the dosing unit.

If there are any cracks or other damage to the DEF quick disconnect connectors, replace the DEF quick disconnect connectors.

Use the following procedure if the aftertreatment DEF dosing unit filter cap is damaged. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

Inspect the DEF line connection ports for cracks or pitting.

If the aftertreatment DEF dosing unit connectors were removed, inspect for cracks and broken o-rings.

Replace the aftertreatment DEF dosing unit connectors or o-rings, if damaged.

The inlet connector and backflow connector on the aftertreatment DEF dosing unit have an incorporated non-serviceable filter screen.

Use a rubber tipped air gun and blow though the connector as shown, onto a piece of white paper.

Inspect for debris on the paper. Debris indicates a clogged connector.

If debris is found in the inlet connector of the aftertreatment dosing valve, inspect the aftertreatment DEF tank filter. See equipment manufacturer service information.

Inspect the electrical connection of the aftertreatment DEF dosing unit for signs of corrosion and debris buildup.

If the pins are heavily corroded or damaged, replace the aftertreatment dosing unit.

If the electrical connector on the aftertreatment DEF dosing unit is damaged, also inspect the 12 pin electrical connector wiring harness. See equipment manufacturer service information.

If replacing the aftertreatment DEF dosing unit, make sure to transfer the protective caps from the replacement aftertreatment DEF dosing unit to the old aftertreatment DEF dosing unit prior to placing it in the core return box.

Fill out any requested information: engine serial number (ESN), mileage, vehicle identification number (VIN), etc.

ANADOLU ISUZU PARTS SALES

Assemble

Note : The backflow, inlet, and outlet connectors are **not** interchangeable and can **only** be installed one way due to thread and length restraints.

Install the connector. Lubricant is **not** required.

Torque Value: 4 n•m [35 in-lb]

Install

Note : Make sure the aftertreatment DEF dosing unit remains free from **any** contamination during installation to the vehicle. To reduce the possibility of false DEF leak reports, use a clean, damp cloth to wipe away **any** DEF spilled during the repair process.

Note : Do **not** interchange 12 volt and 24 volt aftertreatment DEF dosing units.

Attach the aftertreatment DEF dosing unit to the OEM mounting bracket. Secure it with the three capscrews.

Torque Value: 20 n•m [177 in-lb]

- Remove the caps from the electrical and DEF connectors.
- Install the electrical connector first. DEF will cause the electrical connector pins to corrode.
- The 12 pin electrical connector (4) can be installed by sliding the yellow portion of the connector inward. The connector will lower and lock onto the aftertreatment DEF dosing unit.
- Connect the DEF lines to the aftertreatment DEF dosing unit in the following order to reduce the possibility of contamination of the electrical connector. The DEF lines will snap when locked into place.

1. Backflow: DEF return to the DEF tank
2. Inlet: DEF supply to the aftertreatment DEF dosing unit
3. Outlet: DEF supply to the aftertreatment DEF dosing valve.

Lightly tug in the connectors to make sure they are secured.

ANADOLU ISUZU AFTER SALES

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

Do not use the flow test portion of INSITE™ electronic service tool DEF Doser Pump Override Test to check the system for leaks. This will spray DEF into the exhaust system which is at too low a temperature to evaporate, resulting in deposit formations in the exhaust system.

Note : The aftertreatment DEF dosing system will **not** prime itself until the correct SCR temperatures are reached. To verify the system is correctly installed and has no leaks, induce a stationary regeneration to raise the SCR system temperature. The dosing system status can be viewed in INSITE™ electronic service tool to confirm the aftertreatment DEF dosing unit has reached a prime state.

- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Last Modified: 05-Aug-2016

- Coolant hose pinch off pliers
- Container suitable for diesel exhaust fluid (DEF)
- Pick
- Shop vacuum

General Information

⚠ CAUTION ⚠

Use care when handling and/or disconnecting the DEF line from the aftertreatment DEF dosing valve. The DEF supply connector of the aftertreatment DEF dosing valve can be easily damaged.

GRAPHIC NOT FOUND

The aftertreatment DEF dosing valve (1) is used to spray DEF into the exhaust flow prior to the intake of the selective catalytic reduction (SCR) catalyst (2). The aftertreatment DEF dosing valve is located on the decomposition tube (3), mounted on a flange with three capscrews.

Note : The same aftertreatment DEF dosing valve is used for 12 volt and 24 volt systems.

There are four primary connections at the aftertreatment DEF dosing valve:

(4) A 2 pin electrical connection, which connects the aftertreatment DEF dosing valve to the engine control module (ECM).

(5) A DEF supply line, which connects the aftertreatment DEF dosing valve to the aftertreatment DEF dosing unit.

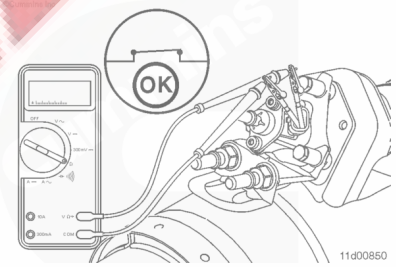
(6) The coolant supply and return connections are interchangeable. They connect the aftertreatment DEF dosing valve to the engine cooling system.

For further information on the operation of the aftertreatment DEF dosing valve, see the following procedure. Refer to Procedure 011-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-011-999.html)

For information on handling incorrect or contaminated DEF, see the following procedure. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)

Measure

Resistance Check



Use a multimeter to check the resistance of the aftertreatment DEF dosing valve.

Note : Repair connector, Part Number 4919115, or equivalent, can be used as a test lead.

Resistance Specification: 11 to 18 ohms.

Note : The resistance **must** be measured at room temperature (approximately 25°C [77°F]).

If the measured value is **not** within specifications, replace the aftertreatment DEF dosing valve.

If the measured resistance is out of specification, the aftertreatment DEF dosing valve may have been overheated.

Inspect the outside of the aftertreatment DEF dosing valve for signs of discoloration from excessive heat.

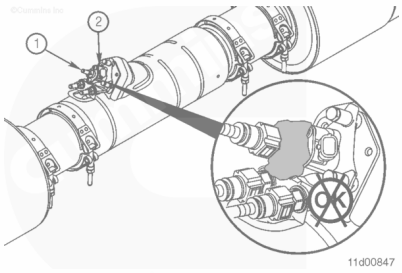
Inspect for inadequate or lack of coolant flow to the aftertreatment DEF dosing valve. Verify there are no leaks, blockages, or restrictions in the coolant supply and return lines between the engine and the aftertreatment DEF dosing valve.

To check the coolant passages internal to the aftertreatment DEF dosing valve, see the Clean and Inspect for Reuse section of this procedure.

Initial Check

⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800°C [1500°F], and exhaust system surface temperature can exceed 700°C [1300°F], which is hot enough to ignite or melt common materials, and to cause serious personal injury. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.



⚠ CAUTION ⚠

Do not use the flow test portion of INSITE™ electronic service tool Diesel Exhaust Fluid Doser Pump Override Test to check the system for leaks. This will spray DEF into the exhaust system at temperatures to low to evaporate, resulting in deposit formations in the exhaust system.

Note : DEF deposits could possibly be left over from a previous DEF spill or repair. Verify active leaks before replacing any components.

Inspect the area around the DEF line connection location at the aftertreatment DEF dosing valve.

Inspect for signs of leaks and/or white deposits.

A DEF leak in this area can come from:

1. The connection between the DEF line and the aftertreatment DEF dosing valve.

Note : Do **not** remove the DEF dosing valve (1) from the assembly (2). It is **not** a serviceable part.

2. The DEF dosing valve joints between the valve and valve assembly body.

Due to deposit buildups possibly masking the source of the leak, it can be necessary to remove the deposits and clean the area with warm water.

Note : The aftertreatment DEF dosing system will **not** prime until the correct selective catalytic reduction (SCR) temperatures are reached.

Test drive the vehicle for a minimum of 15 minutes to get the SCR system up to temperature. Check the area again for the source of the leak.

Once the source of the DEF leaks and/or deposits are identified, see the Clean and Inspect for Reuse section of this procedure.

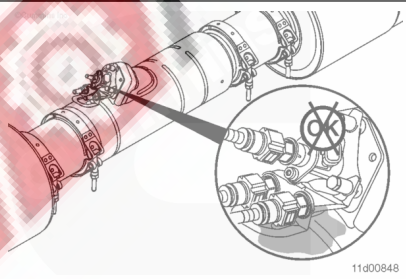
Inspect the dosing valve body and coolant fittings at the aftertreatment DEF dosing valve.

Inspect for signs of leaks and/or deposits.

If the aftertreatment DEF dosing valve is suspected to be leaking coolant and the source of the coolant leak can **not** be identified, pressurize the cooling system. Refer to Procedure 008-020 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-020.html)

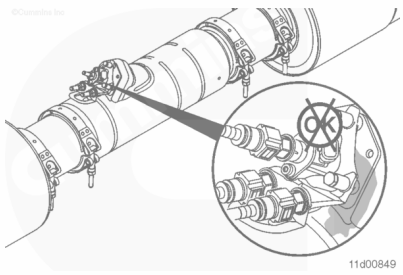
If leaks and/or deposits are identified, see the Clean and Inspect for Reuse section of this procedure after the connections are removed.

Service Tip: If removal of the coolant fittings and/or heat shield is necessary, remove/loosen the coolant fitting prior to removing the aftertreatment DEF dosing valve. See the Preparatory Steps and Disassemble sections of this procedure.



Inspect the body and around the base of the aftertreatment DEF dosing valve. Check for signs of exhaust leaks and white deposits.

If leaks and/or deposits are identified, see the Clean and Inspect for Reuse section of this procedure.



Preparatory Steps

⚠ WARNING ⚠

Diesel exhaust fluid (DEF) contains urea. Do not get the substance in your eyes. In case of contact, immediately flush eyes with large amounts of water for a minimum of 15 minutes. Do not swallow. In the event the DEF is ingested, contact a physician immediately. Reference the Materials Safety Data Sheet (MSDS) for additional information.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800°C [1500°F], and exhaust system surface temperature can exceed 700°C [1300°F], which is hot enough to ignite or melt common materials, and to cause serious personal injury. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

⚠ WARNING ⚠

The DEF line connecting the aftertreatment DEF dosing unit to the aftertreatment DEF dosing valve is under low pressure and should not be disconnected while the engine is running or before the system has completed

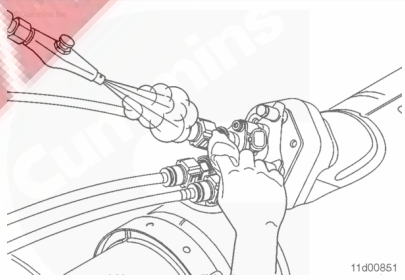
the purge process after engine shutdown. Disconnecting the DEF line while under low pressure could cause DEF to spray.

Note : Do **not** disconnect the vehicle batteries until the DEF dosing system has completed the purge cycle. Before beginning to remove and/or disconnect any components, wait at least 5 minutes after the keyswitch is turned OFF for the aftertreatment DEF dosing system to purge the DEF from the system. The purge cycle is an automatic process and does **not** require intervention to occur. The aftertreatment DEF dosing unit will create an audible pumping noise during the purging process.

- Disconnect the batteries. See equipment manufacturer service information.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



Use compressed air to remove any debris from around the aftertreatment DEF dosing valve and connections.

Remove any debris trapped in the gaps between the aftertreatment DEF dosing valve and aftertreatment decomposition tube, so debris does **not** fall into the aftertreatment decomposition tube upon removal of the aftertreatment DEF dosing valve.

If there are any white deposits on the DEF line connection, remove them by wiping with a clean shop towel soaked in warm water.

Do **not** drain the cooling system. Use one of the following two methods to prevent draining the cooling system when the aftertreatment DEF dosing valve coolant lines are disconnected.

Use the following instructions for method number 1.

Note : Prior to pursuing this method, inspect the aftertreatment DEF dosing valve coolant lines to make sure they are flexible hose material that will **not** be damaged when using the coolant hose pinch-off pliers.

Use a pair of coolant hose pinch-off pliers. Clamp both of the aftertreatment DEF dosing valve coolant lines.

Place a container under the aftertreatment DEF dosing valve. A small quantity of coolant can drain from the coolant lines when disconnected.

Note : The coolant supply/return and DEF lines are supplied by the original equipment manufacturer (OEM). The removal of these lines can vary by OEM. The fittings on the aftertreatment DEF dosing valve are set up for quick-disconnect style fittings.

Disconnect the coolant lines. See equipment manufacturer service information.

Insert coolant line plugs, Part Number 4919576, into the disconnected coolant lines. The coolant hose pinch-off pliers can be removed.

Use the following instructions for method number 2.

Determine the appropriate radiator/coolant expansion tank cap adapter for the vehicle being serviced. The list of available caps and applications can be found in Section 14 of the Service Products Catalog.

Install the adapter on the radiator/coolant expansion tank. Connect an automotive hand held vacuum pump and apply 76 mm-hg [3 in-hg] of vacuum.

Note : Depending on the cooling system configuration, more vacuum can be required to keep the cooling system in balance, especially on systems where there is a significant height difference between the aftertreatment DEF dosing valve and radiator/coolant expansion tank fill location.

Note : The coolant supply and DEF lines are supplied by the OEM. The removal of these lines can vary by OEM. The fittings on the aftertreatment DEF dosing valve are set up for quick-disconnect style fittings.

Place a container under the aftertreatment DEF dosing valve. A small quantity of coolant can drain from the coolant lines when disconnected.

Disconnect the coolant lines. See equipment manufacturer service information.

Insert coolant line plugs, Part Number 4919576, or equivalent, into each of the disconnected coolant lines.

The vacuum pump can be removed.

⚠ CAUTION ⚠

Care should be taken when handling and/or disconnecting the DEF line from the aftertreatment DEF dosing valve. The DEF supply line connector of the aftertreatment DEF dosing valve can be easily damaged.

Disconnect the connections at the aftertreatment DEF dosing valve in the following order:

Place a small plastic container under the aftertreatment DEF dosing valve to catch any residual DEF prior to disconnecting the DEF supply line.

(1) Disconnect the DEF line. See equipment manufacturer service information.

Note : Protect the coolant and DEF ports with plastic caps to prevent entrance of dirt and debris.

Press the tab on the electrical connector. Pull to disconnect the 2 pin electrical connector.

After the electrical connection is disconnected, cover the connection on the aftertreatment DEF dosing valve with electrical tape to prevent DEF from getting into the electrical connection.

Remove

In some applications an aftertreatment DEF dosing valve guard can be installed around the dosing valve.

Remove the capscrews.

Remove the guard.

⚠ CAUTION ⚠

Do not set the aftertreatment DEF dosing valve down on the spray area of the aftertreatment DEF dosing valve. Damage can occur.

Remove the capscrews (1) and spacers (2) that mount the aftertreatment DEF dosing valve to the decomposition tube.

ANADOLU ISUZU AFTER SALES

Remove the aftertreatment DEF dosing valve.

Remove the insulated gasket (3).

Remove the thermal isolator (4). The isolator can become brittle and adhere to either the aftertreatment decomposition tube or aftertreatment DEF dosing valve. Do **not** drop isolator material into the aftertreatment decomposition tube when removing. Apply water to the isolator to soften its composition. Use a pick and a shop vacuum to properly remove the isolator, if necessary.

Discard the gaskets and isolator.

Note : A small amount of DEF deposits is normal if observed on the aftertreatment DEF dosing valve face and around the isolator of the aftertreatment DEF dosing valve.

Note : Plug the aftertreatment DEF lines to reduce the possibility of debris entering the system.

Disassemble

Note : The aftertreatment DEF dosing valve should **only** be disassembled if a symptom has been identified that indicates further investigation is required.

Remove the two coolant fittings from the aftertreatment DEF dosing valve.

Remove the o-rings from the coolant fittings and discard.

Remove the heat shield.

Clean and Inspect for Reuse

Note : Do **not** remove the DEF dosing valve (1) from the assembly (2). It is **not** a serviceable part.

If leaks/deposits are found at the DEF dosing valve joints between the valve and valve assembly body during the Initial Check section of this procedure, replace the aftertreatment DEF dosing valve.

If leaks/deposits are found at the DEF line connection during the Initial Check section of this procedure, inspect the DEF line connection port for cracks or pitting.

Note : If damage/corrosion is found, also inspect the DEF line connection. See equipment manufacturer service information.

Inspect the electrical connection and pins for damage/corrosion. Refer to Procedure 019-361 in Section 19. (/qs3/pubsys2/xml/en/procedures/99/99-019-361.html)

Note : If damage/corrosion is found, inspect the electrical connector and pins on the vehicle harness. See equipment manufacturer service information.

Replace the aftertreatment DEF dosing valve if damage is found.

Note : The heat shield and coolant fittings are serviceable items of the aftertreatment DEF dosing valve.

If leaks/deposits are found at the coolant line connections during the Initial Check section of this procedure, inspect the coolant fittings for cracks and signs of corrosion and/or pitting.

If corrosion is found, the coolant can be contaminated and/or the concentration incorrect. Check the coolant. For specifications, refer to Service Bulletin, Cummins® Coolant Requirements and Maintenance, Bulletin 3666132 (/qs3/pubsys2/xml/en/bulletin/3666132.html).

Note : If damage/corrosion is found, inspect the coolant line connector(s). See equipment manufacturer service information.

Inspect the base of the coolant fittings.

Inspect the heat shield for cracks or heavy corrosion.

Replace as required. See the Disassemble section of this procedure.

If the coolant fittings were removed from the aftertreatment DEF dosing valve assembly, inspect the threads and o-ring sealing surfaces of the following for pitting and corrosion:

- Coolant fittings
- Coolant ports in the aftertreatment DEF dosing valve assembly.

Clean with abrasive pad, Part Number 3823258, or equivalent, and a clean cloth.

If the pitting and/or corrosion can **not** be removed with the abrasive pad, replace the component.

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacture's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

Do not submerge the aftertreatment DEF dosing valve in solvent or water. Damage to the aftertreatment DEF dosing valve will result.

Note : If **not** already removed, remove the coolant fittings from the aftertreatment DEF dosing valve. See the Disassemble section of this procedure.

Clean the aftertreatment DEF dosing valve coolant passages with a safety solvent. Use a pipe cleaner to clean the passageways.

Do **not** spill solvent on the dosing valve.

With the aftertreatment DEF dosing valve positioned so the coolant ports are pointing upward, pour safety solvent in one coolant port until the safety solvent begins to flow out of the opposite port.

Tip the aftertreatment DEF dosing valve so the safety solvent flows out of the port **not** filled. Verify the safety solvent flows out of this port as one continuous stream.

If safety solvent does **not** flow as one continuous stream, the coolant passage can still be restricted or blocked. Repeat the cleaning process again and inspect. If there is no change, replace the aftertreatment DEF dosing valve.

Dry with compressed air.

⚠ CAUTION ⚠

Use only warm water to clean the tip of the aftertreatment DEF dosing valve. The use of a wire wheel or brass brush or any other abrasive medium will cause permanent damage to the aftertreatment DEF dosing valve.

Use a clean shop cloth soaked in warm water to dissolve and wipe DEF deposits away on the dosing valve tip.

Inspect the dosing valve tip for cracks or other damage. Replace if damage is found.

If leaks/deposits are found at the base of the aftertreatment DEF dosing valve during the Initial Check section of this procedure, inspect the following:

- The bottom of the aftertreatment DEF dosing valve around the gasket sealing surface for signs of heavy corrosion, pitting and/or surface damage. Replace the aftertreatment DEF dosing valve if damage is found.
- The aftertreatment DEF dosing valve mounting surface on the decomposition tube. Refer to Procedure 011-062 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-062.html)

If replacing the aftertreatment DEF dosing valve, make sure to transfer the protective caps from the replacement aftertreatment DEF dosing valve to the old aftertreatment DEF dosing valve prior to putting it in the core return box.

Make sure to fill out any requested information (engine serial number (ESN), mileage, and vehicle identification number (VIN)).

Inspect the capscrews for damaged threads, corroded surfaces, or a reduced shank diameter (due to capscrew stretching).

Replace if damage is found.

Assemble

Install new o-rings onto the two coolant fittings. Lubricate the o-rings. Use assembly lubricant, Part Number 3163086, or equivalent.

Install the heat shield.

Install the coolant fittings onto the aftertreatment DEF dosing valve.

Tighten the coolant fittings.

Torque Value: 6 n•m [53 in-lb]

Service Tip: If removal of the coolant fittings and/or heat shield was necessary, install the coolant fittings after installing the aftertreatment DEF dosing valve. See the Install section of this procedure.

Install

Remove any protective caps.

Make sure the aftertreatment DEF dosing valve spray port is free of gasket material and other debris.

Apply a coat of high temperature anti-seize compound to the threads of the aftertreatment DEF dosing valve mounting capscrews.

Install the insulated gasket (3) with the metallic side facing the aftertreatment DEF dosing valve. The insulated gasket can be held to the aftertreatment DEF dosing valve by inserting the capscrews (1) and spacers (2) into the square holes on the gasket to aid in alignment and installation.

Note : If the aftertreatment decomposition tube has been loosened or removed during the repair, confirm its orientation before installing the DEF dosing valve. Refer to Procedure 011-062 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-062.html)

Install the aftertreatment DEF dosing valve onto the decomposition tube.

Tighten the capscrews by hand at first until the gasket is seated properly in the aftertreatment decomposition tube flange. Use the sequence shown in the left illustration.

Tighten the capscrews in the sequence shown in the right illustration.

Torque Value: 9 n•m [80 in-lb]

Install the aftertreatment DEF dosing valve guard, if removed. Tighten the capscrews.

Torque Value: 9 n•m [80 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

Do not use the flow test portion of INSITE™ electronic service tool Diesel Exhaust Fluid Doser Pump Override Test to check the system for leaks. This will spray DEF into the exhaust system at temperatures too low to evaporate, resulting in deposit formations in the exhaust system.

Note : Remove any protective caps and/or covers from the electrical, coolant, and DEF ports just prior to making the connection.

Make the connections at the aftertreatment DEF dosing valve in the following order:

(1) The 2 pin electrical connector.

Note : The coolant supply and DEF lines are supplied by the OEM. The installation of the lines can vary by OEM. The fittings on the aftertreatment DEF dosing valve are set up for quick disconnect style fittings.

(2) Use the same method as used in the Preparatory Steps section to prevent draining the cooling system when the aftertreatment DEF dosing valve coolant lines are disconnected.

Remove coolant line plugs, Part Number 4919576, from each of the disconnected coolant lines.

Connect the coolant supply and return lines. See equipment manufacturer service information.

Remove all tools used.

(3) Connect the DEF line. See equipment manufacturer service information.

Once all connections are made, give each a slight pull to make sure they are securely installed.

- If any coolant was spilled, check the coolant level. Fill as required. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.

Note : The aftertreatment DEF dosing system will not prime until the correct SCR temperatures are reached. To verify the system is correctly installed and has no leaks, induce a stationary regeneration to get the SCR system up to temperature.

- Operate the engine. Check for leaks.

ANADOLU ISUZU AFTER SALES

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

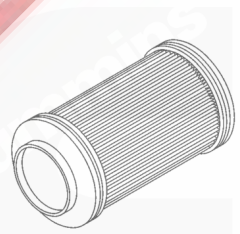
- No Cummins® service tools required.

Additional Service Items

- 27 mm wrench

General Information

The diesel exhaust fluid (DEF) dosing unit filter is designed to prevent foreign objects that can be suspended in the DEF from entering the dosing system.



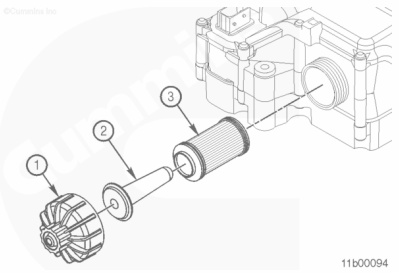
11b00093

Debris can cause permanent damage and premature failure to either the aftertreatment DEF dosing unit or the aftertreatment DEF dosing valve. The aftertreatment DEF dosing unit filter is a maintenance item.

Use the following procedure for handling incorrect or contaminated DEF. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)

The aftertreatment DEF dosing unit filter consists of the following components:

1. Aftertreatment DEF dosing unit filter cap
2. Aftertreatment DEF dosing unit filter equalizing element
3. Aftertreatment DEF dosing unit filter element.

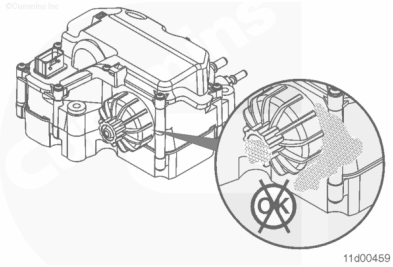


11b00094

Initial Check

Locate the aftertreatment DEF dosing unit on the vehicle.
Notice the dome-shaped filter cap.

Note : The location of the aftertreatment DEF dosing unit varies on vehicles. Locate the DEF tank. Follow the DEF lines to the aftertreatment DEF unit.



Inspect the area around the seal and vent of the aftertreatment DEF dosing unit filter cap for signs of leakage.

DEF leaks leave a white deposit. If deposits are found, see the Clean and Inspect for Reuse section in this procedure.

Preparatory Steps

⚠ WARNING ⚠

Diesel exhaust fluid (DEF) contains urea. Do not get the substance in your eyes. In case of contact, immediately flush eyes with large amounts of water for a minimum of 15 minutes. Do not swallow. In the event the DEF is ingested, contact a physician immediately. Reference the Materials Safety Data Sheet (MSDS) for additional information.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

The diesel exhaust fluid (DEF) line connecting the aftertreatment DEF dosing unit to the aftertreatment DEF dosing valve is under low pressure and should not be disconnected while the engine is running or before the system has completed the purge process after engine shutdown. Disconnecting the DEF line while under low pressure could cause DEF to spray.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Note : Do **not** disconnect the vehicle batteries until the DEF dosing system has completed the purge cycle. Before beginning to remove and/or disconnect any components, wait at least 5 minutes after the keyswitch is turned OFF for the aftertreatment DEF dosing system to purge the DEF from the system. The purge cycle is an automatic process and does **not** require intervention to occur. The

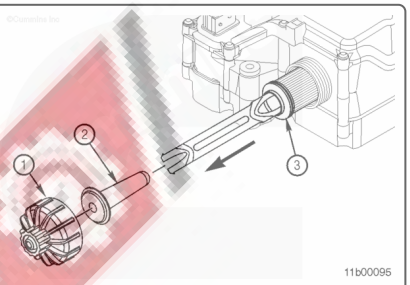
aftertreatment DEF dosing unit will create an audible pumping noise during the purging process

Note : Do **not** power wash or steam clean this unit. Use compressed air to remove any loose debris.

- Disconnect the batteries. See equipment manufacturer service information.

Remove

Note : There can be residual DEF in the filter housing. A collection container placed below the DEF filter cap is recommended.



11b00095

Unscrew the DEF filter cap (1). A 27 mm wrench can be used on the cap to aid in removal.

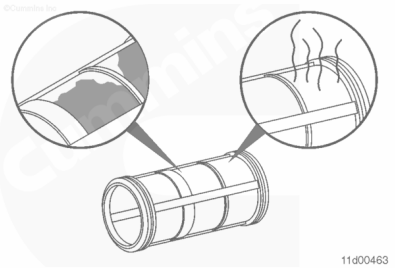
Remove the aftertreatment DEF filter equalizing element (2).

Remove the old aftertreatment DEF dosing unit filter element (3). A disposable service tool is included with the filter to aid in filter removal. Use the appropriate end of the tool, depending on the color of the plastic on the filter. When inserting the tool, a "click" sound can be heard which indicates proper engagement with the filter.

Note : If the filter element and equalizing element are removed from the aftertreatment DEF dosing unit, they **must** be discarded and replaced, regardless of condition.

Clean and Inspect for Reuse

If there is the possibility contaminated DEF has gone through the DEF dosing system, check the DEF filter prior to discarding the filter.



11d00463

Check the diesel exhaust filter for evidence of contaminated DEF. Use visual and aroma characteristics of the filter to determine if contaminated fluid has passed through the dosing system.

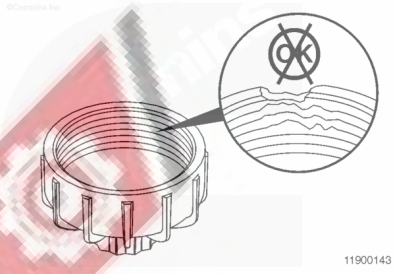
Use the following procedure for further information on contaminated DEF. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)

Inspect the diesel exhaust filter for debris. If debris is evident, also check:

- DEF tank pick up screen. See equipment manufacturer service information.
- The aftertreatment DEF dosing unit inlet connector. Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html)

Discard the filter element and equalizing element.

Inspect the aftertreatment DEF dosing unit filter cap for cracks or holes that could create a DEF leak path.



Check the condition of the threads on the aftertreatment DEF dosing unit cap.

If the threads are damaged, replace the aftertreatment DEF dosing unit filter cap.

Inspect the aftertreatment DEF dosing unit threads. This is especially important if the aftertreatment DEF dosing unit cap was damaged.

If the Aftertreatment DEF dosing unit threads are damaged, replace the entire aftertreatment DEF dosing unit.

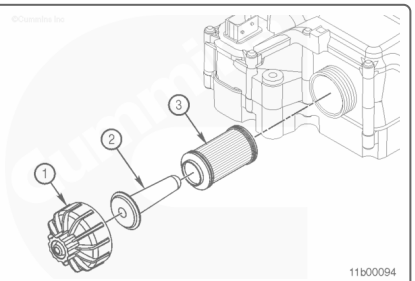
⚠ CAUTION ⚠

Never operate the vehicle with the DEF cap removed.

Clean the aftertreatment DEF dosing unit cap and threads on the dosing unit. Use warm water and a clean cloth.

Install

Note : Lubrication of the DEF filter o-rings is **not** required.



Slide the DEF filter equalizing element (2) into the DEF filter cartridge (3).

Insert the assembly into the aftertreatment DEF dosing unit.

Install and tighten the cap (1). A 27 mm wrench can be used to install and tighten the filter cap.

Torque Value: 20 n•m [177 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

Do not use the flow test portion of the INSITE™ electronic service tool Diesel Exhaust Fluid Doser Pump Override Test to check the system for leaks. This will spray DEF into the exhaust system at temperatures too low to evaporate, resulting in deposit formations in the exhaust system.

- Connect the batteries. See equipment manufacturer service information.
- Use INSITE™ electron service tool to perform the Aftertreatment Diesel Exhaust Fluid Leak Test, under Engine Control Module Diagnostics Tests.
- Operate the system. Check for leaks.

ANADOLU FUEL AFTERSALES

Last Modified: 06-Dec-2016

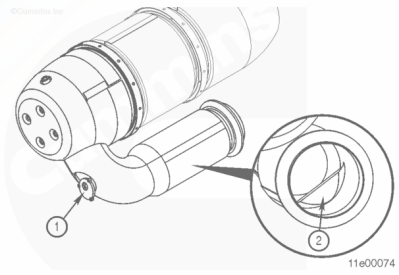
General Information

The decomposition tube is the section of exhaust pipe between the aftertreatment diesel particulate filter (DPF) and aftertreatment selective catalytic reduction (SCR) catalyst. The aftertreatment decomposition tube is designed to help atomize and mix the diesel exhaust fluid (DEF) being sprayed into the exhaust stream for complete NOx conversion.



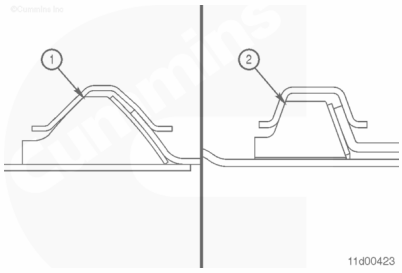
The aftertreatment decomposition tube is composed of two important areas.

1. The aftertreatment DEF dosing valve mount: The position at which the aftertreatment DEF dosing valve is mounted and allowed to spray DEF into the exhaust stream.
2. The aftertreatment decomposition tube mixer: The mixer creates a swirl pattern exhaust stream to help mix the DEF and engine exhaust.

Different vehicles will require different aftertreatment configurations. Some of the aftertreatment decomposition tubes can have elbows clamped to either end of the tube.

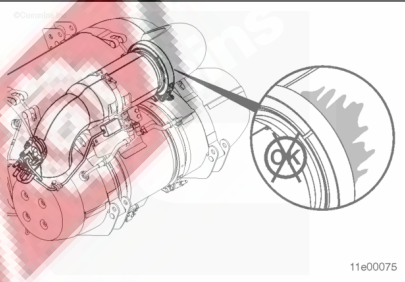
Different flanges are available to accommodate variations in vehicle aftertreatment configurations. The clamps and gaskets on either end of the aftertreatment decomposition tube can be different from one another. There are two types

of flanged joints, spherical Marman® and full Marman®. The spherical Marman® (1) joints allow a small amount of misalignment and have a rounded cross section. The full Marman® (2) joints are completely rigid and have a more edgy profile.



Initial Check

Inspect all the joints for any signs of leaks. Leaking DEF will leave white deposits. If a DEF leak is found, see the Clean and Inspect for Reuse section of this procedure.



Preparatory Steps

⚠ WARNING ⚠

During regeneration, exhaust gas temperature could reach 800°C [1500°F], and exhaust system surface temperature could exceed 700°C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

ANADOLU ISUZU AFTER SALES

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

The aftertreatment DEF dosing valve is a fragile item. Use great care when handling this part. Avoid putting stresses on the fluid connectors, as damage to the component can result.

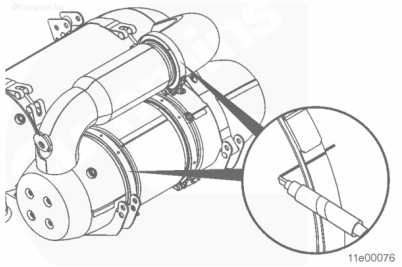
Note : It is acceptable to remove the aftertreatment dosing valve without removing the DEF and coolant lines. Support the aftertreatment DEF dosing valve. Do **not** let it suspend freely. It can damage the fluid connectors and lines.

- Disconnect the batteries. See equipment manufacturer service information.
- Clean the area. Use shop air. Remove any debris from the aftertreatment decomposition tube.
- If applicable, remove the aftertreatment DEF dosing valve guard from the aftertreatment decomposition tube. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)
- Remove the aftertreatment DEF dosing valve from the aftertreatment decomposition tube. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

Remove

⚠ CAUTION ⚠

Do not use an air tool to remove the V-band clamp nut. An air tool will damage the threads. Apply thread lubricant to the V-band clamp threads prior to nut removal.



Note : Before removing the aftertreatment decomposition tube, note the location and orientation of the aftertreatment decomposition tube and related components. Apply identifying markings to aid in installation.

Note : There can be identifying marks from a previous repair, make sure the aftertreatment decomposition tube orientation is correct by following the Install section of this procedure.

Note : In some applications the aftertreatment decomposition tube can be welded to the aftertreatment SCR or aftertreatment elbow.

Note : Depending on the exhaust configuration, it can be necessary to loosen exhaust hangers or remove additional elbows and exhaust piping securing the rest of the aftertreatment before removing the aftertreatment decomposition tube.

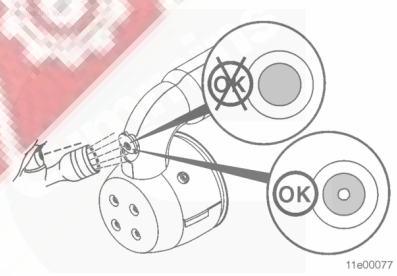
Remove the exhaust clamps from both ends of the aftertreatment decomposition tube.

Remove the aftertreatment decomposition tube.

Discard the gaskets.

Clean and Inspect for Reuse

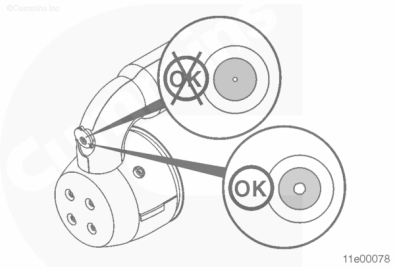
Note : If troubleshooting a fault code has a step that indicates to check the aftertreatment decomposition for DEF deposits, clean the aftertreatment decomposition tube of DEF deposits, regardless of the inspection criteria in the steps below.



Inspect the aftertreatment DEF dosing valve spray port in the aftertreatment decomposition tube for DEF deposits.

If the DEF spray port is completely blocked by DEF deposits, clean the aftertreatment decomposition tube according to the cleaning steps later in this procedure.

If the aftertreatment DEF dosing valve spray port is blocked with DEF deposits, there can be issues with the orientation of the aftertreatment dosing valve or an issue with the valve itself. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)



Inspect the aftertreament DEF dosing valve spray chamber in the aftertreatment decomposition tube. If there is a DEF deposit protruding into the main decomposition tube area that has a free flow path for a pressurized DEF stream and there are no active fault codes, no action is required.

Note : Use a light source when looking into the aftertreatment decomposition tube to inspect for a free flow path for a pressurized DEF stream.

It is **not** uncommon to see three holes in a DEF deposit. This is a formation of the three injection holes on the nozzle of the aftertreatment DEF dosing valve.

If there is a DEF deposit protruding into the main decomposition tube area restricting the free flow path for a pressurized DEF stream, clean the aftertreatment decomposition tube according to the cleaning steps later in this procedure.

If the aftertreatment DEF dosing valve spray chamber is blocked with DEF deposits, there can be issues with the orientation of the aftertreatment dosing valve or an issue with the valve itself. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

Inspect the aftertreatment decomposition tube main area around the mixer. If the mixer area is less than 50 percent blocked by DEF deposits, no action is necessary.

If the DEF deposits in the mixer area are blocking more than 50 percent of the aftertreatment decomposition tube, regardless if any related active fault codes are present, the aftertreatment decomposition tube **must** be cleaned. See the cleaning steps below.

If the DEF deposits in the mixer area are blocking more than 50 percent of the aftertreatment decomposition tube, there can be issues with the orientation of the aftertreatment dosing valve or an issue with the valve itself. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

Inspect the intake of the aftertreatment SCR catalyst for DEF deposits. Refer to Procedure 011-036 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-036.html)

Inspect the outlet of the DPF for DEF deposits. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)

Inspect any additional elbows or exhaust pipes connected to the aftertreatment decomposition tube for DEF deposits. See the cleaning steps below.

⚠ CAUTION ⚠

Do not use a metallic object to clean the aftertreatment decomposition tube. This will scratch the surface of the aftertreatment decomposition tube which may cause future excessive diesel exhaust fluid deposits.

If DEF deposits are present, carefully scrape with a non-metallic object to remove the majority of the DEF deposits.

Use a pressure washer to dissolve the remaining DEF deposits.

Note : It is acceptable to have a small amount of DEF deposits remaining in the mixer area after the cleaning steps. The remaining DEF deposits can be removed by performing a stationary regeneration. See the Finishing Steps below.

Use **only** water to remove deposits.

Do **not** submerge the aftertreatment decomposition tube in water or solvents which can saturate the insulation.

Inspect the exhaust flanges for corrosion or other damage.

Use an abrasive pad to remove any residual gasket material from the flanges on the aftertreatment decomposition tube.

Do **not** grind on the flange surface. This can damage the flange and cause the connection to leak.

Inspect the V-band clamps and mounting straps for signs of overextension.

The band **must not** be bent or damaged.

Inspect the V-band clamp and mounting strap threads for damage.

Replace the V-band clamp or mounting strap if damage is found.

⚠ CAUTION ⚠

Do not use a metallic object to clean the aftertreatment decomposition tube dosing valve mounting area. Damage to the gasket/isolator sealing surface area can result.

Inspect the aftertreatment DEF dosing valve mounting area.

Inspect for old gasket/isolator material or corrosion.

Clean with an abrasive pad.

Check the threaded capscrew holes for damaged threads.

If the capscrew holes are damaged, the aftertreatment decomposition tube can be repaired.

ANADOLU ISUZU PARTS SALES

Inner coil threads, M6 X 1.0, can be used to repair any damaged threads.

Use **only** the wire type coil inserts because the amount of material around the threaded capscrew hole is limited.

Follow the manufacturer's recommended guidelines to install the coiled threaded insert.

Note : The aftertreatment decomposition tube should be smooth and free from scratches and other damage.

If the aftertreatment decomposition tube has **any** structural defects or material degradation, replace the aftertreatment decomposition tube.

Note : Surface corrosion such as rust on the inside of the aftertreatment decomposition tube can possibly be observed. Do **not** replace the aftertreatment decomposition tube for this condition.

Check the following areas:

1. Aftertreatment dosing valve mount
2. Mixer
3. Insulation
4. Welded joints.

Install

⚠ CAUTION ⚠

Do not use an air tool to tighten the V-Band clamp. An air tool will damage the threads.

Note : The gaskets and clamps on either end of the aftertreatment decomposition tube may **not** be the same. See the General Information section of this procedure. Where applicable, install and tighten the full Marman® clamps before the spherical Marman® clamps to account for misalignment in the aftertreatment system.

Install the aftertreatment decomposition tube. Use new gaskets.

ANADOLU ISUZU AFTER SALES

If other parts of the aftertreatment were adjusted in the removal process of the aftertreatment decomposition tube, slide them back into position.

Align the aftertreatment decomposition tube.

As viewed from the inlet/outlet of the aftertreatment decomposition tube, the aftertreatment DEF dosing valve mount **must** be placed between ±45 degrees and ±85 degrees from vertical.

Only use the identification marks made before removal if the above positioning criteria is met.

Apply a coat of anti-seize compound on the threads of the V-band clamps.

Install the clamps.

Torque Value: 14 n•m [124 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Tighten any aftertreatment hangers that could possibly have been loosened in the removal process. See equipment manufacturer service information.
- Install the aftertreatment DEF dosing valve. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)
- If applicable, install the aftertreatment DEF dosing valve guard. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)
- Connect the batteries. See equipment manufacturer service information.
- Start the engine. Check for exhaust leaks.

Note : If DEF deposits were present, and cleaning of the aftertreatment decomposition tube was required, complete a stationary regeneration to make sure the remaining DEF deposits haves been removed from the aftertreatment system. Continue to monitor for leaks at the exhaust joints.

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Aftertreatment Diesel Exhaust Fluid (DEF) Doser Shutoff Valve Test Kit, Part Number 4919573, or equivalent
- Graduated beaker, Part Number 4919139, or equivalent

Additional Service Items

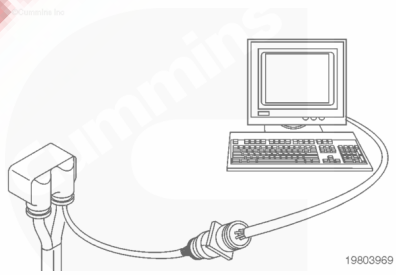
- Container suitable for DEF

General Information

Perform a dosing cycle to check the:

- Aftertreatment DEF dosing valve spray characteristics
- Amount of DEF to be delivered in a specified time (6 minutes).

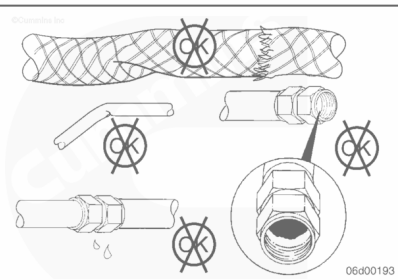
The test can be accessed through INSITE™ electronic service tool under engine control module (ECM) Diagnostic Tests. Follow the on-screen instructions to perform the test.



Initial Check

Check for any leaks, blockages, or restrictions in the DEF line between the aftertreatment DEF dosing unit and aftertreatment DEF dosing valve.

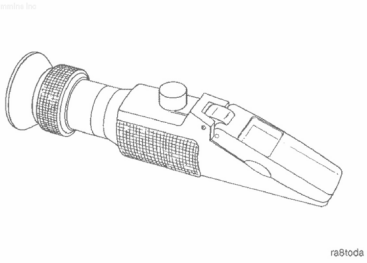
Repair, as necessary. See equipment manufacturer service information.



Check for an adequate amount of DEF in the DEF tank prior to starting this test.

ANADOLU ISUZU

Check the concentration and quality of the DEF. Refer to Procedure 011-056 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-056.html)



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

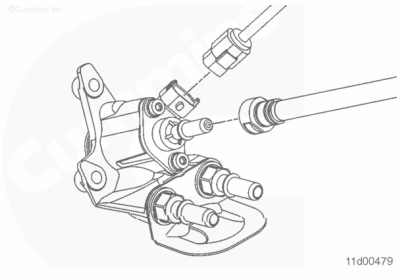
Note : Low battery voltage can cause the dosing volume to be low. Check the batteries. See equipment manufacturer service information.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the aftertreatment DEF dosing valve. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

Setup

⚠ CAUTION ⚠

Care should be taken when handling and/or disconnecting the DEF line from the aftertreatment DEF dosing valve. The intake connection of the aftertreatment DEF dosing valve is plastic and can be easily damaged.



⚠ CAUTION ⚠

Do not connect a 12 VDC or 24 VDC supply to the aftertreatment DEF dosing valve as this will cause permanent damage.

Connect the electrical and DEF lines. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

Note : The coolant plumbing does **not** need to be connected for this test.

Note : There may **not** be enough length for the existing electrical and/or DEF line to allow the aftertreatment DEF dosing valve to be placed in the container. Use Aftertreatment DEF Doser Shutoff Valve Test Kit , Part Number 4919573, or equivalent, which contains:

- Wiring harness extension, Part Number 4919575
- DEF extension line, Part Number 4919574
- Coolant line plug, Part Number 4919576.

Note : It can be easier to capture the DEF in a clean container and transfer the DEF to the measuring device for the final measurement.

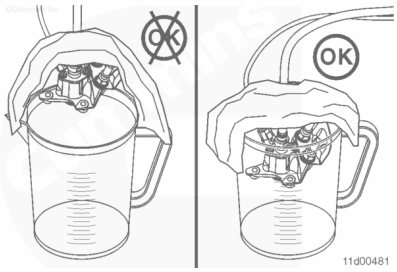
Obtain a clear plastic container (large enough to hold the aftertreatment DEF dosing valve) and graduated beaker, Part Number 4919139, or equivalent. A measuring cup marked in milliliters (ml) or ounces (oz) can also be used.

The measuring device **must** be capable of measuring between 0 ml [0.0 oz] and 500 ml [17.0 oz] in 5 ml [0.34 oz] increments

Place the aftertreatment DEF dosing valve into the container.

⚠ WARNING ⚠

Diesel exhaust fluid (DEF) contains urea. Do not get the substance in your eyes. In case of contact, immediately flush eyes with large amounts of water for a minimum of 15 minutes. Do not swallow. In the event the DEF is ingested, contact a physician immediately. Reference the materials safety data sheet (MSDS) for additional information.



Note : When the test is started, the dosing system will first prime. During this process the aftertreatment DEF dosing valve will open intermittently to purge air from the system. In doing so, some DEF will be sprayed from the tip. This is a normal operating characteristic.

When the test is being performed, the aftertreatment DEF dosing valve will spray a very fine mist of DEF. To prevent fine mist from escaping into the air and to make sure of an accurate measurement, place a clean shop towel or cover over the valve and container.

When the test begins, briefly monitor the spray pattern of the DEF exiting the aftertreatment DEF dosing valve. Check for:

- Signs of larger drops and/or dripping DEF from the tip
- Spray pattern that is **not** symmetrical (sprays more to one side).

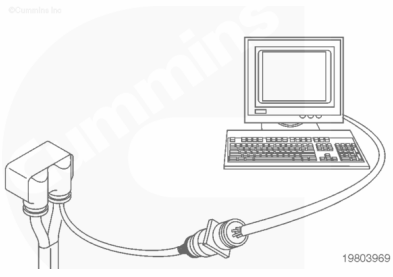
If either of these symptoms is noted, stop the test and inspect the aftertreatment DEF dosing valve tip. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

After cleaning, perform the test again and monitor the spray pattern. If the problem persists, replace the aftertreatment DEF dosing valve. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

Note : If a leak at the DEF dosing valve tip is suspected, the Aftertreatment Diesel Exhaust Fluid System Leak Test can be used to confirm the symptom. Refer to Procedure 011-080 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-080.html)

Flow Test

Note : Prior to performing this test, if **not** already directed by a fault code troubleshooting tree, view and troubleshoot any fault codes with INSITE™ electronic service tool. See the L9 CM2350 L119B Fault Code Troubleshooting Manual, Bulletin 5411270.



- Turn the keyswitch ON.
- Connect INSITE™ electronic service tool.
- Locate the Diesel Exhaust Fluid Doser Pump Override Test under ECM Diagnostic Tests.
- Follow the on-screen instructions to perform the test.

INSITE™ electronic service tool will start the test and inject the DEF for 6 minutes. INSITE™ electronic service tool will automatically disable the injector at the end of the test. If the

test needs to be stopped before finishing, click the STOP button.

After the test is complete (test runs for 6 minutes), measure the amount of DEF sprayed into the container. Pour the DEF into graduated beaker, Part Number 4919139, or equivalent.

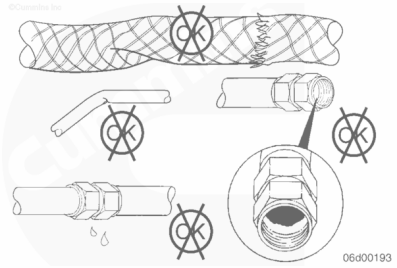
Perform the test three times. The amount of DEF measured for each test **must** be within specification.

Aftertreatment DEF Dosing Valve Volume Specifications		
ml		fl-oz
85	MIN	2.9
115	MAX	3.9

Note : Do **not** pour the DEF back into the DEF tank. Dispose of the DEF in accordance with local environmental regulations.

Note : Inspect the collected sample of DEF for signs of debris or contamination.

Note : Low battery voltage can cause the dosing volume to be low. Check the batteries. See equipment manufacturer service information. View and troubleshoot any fault codes with INSITE™ electronic service tool. See the L9 CM2350 L119B Fault Code Troubleshooting Manual, Bulletin 5411270.



If the amount of DEF is **not** within specification, check for leaks, blockages, or restrictions in the DEF line between the aftertreatment DEF dosing unit and aftertreatment DEF dosing valve. Use the following as a guide if the amount of DEF is still **not** within specification for one or more of the three tests:

- Clean the DEF dosing valve if one or more of the test results is below 85 ml [2.9 oz].
- Replace the DEF dosing valve if one or more of the test results is above 115 ml [3.9 oz].
- Replace the DEF dosing valve if the test results vary with both below-specification and above-specification conditions. This could be an erratic valve with intermittent malfunction and **must** be replaced. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)

Note : The aftertreatment DEF dosing valve may have been plugged by debris. Inspect the aftertreatment DEF dosing unit filter for signs of contamination and debris prior to installing the new aftertreatment DEF dosing valve. Refer to Procedure 011-060 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-060-tr.html)

⚠ CAUTION ⚠

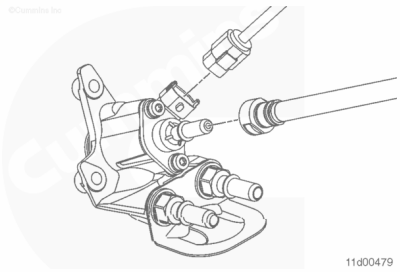
Do not submerge the aftertreatment DEF dosing valve in solvent or water. Damage to the aftertreatment DEF dosing valve will result.

After the test is complete, a light coating of DEF will cover the aftertreatment DEF dosing valve, DEF line, and electrical line.

Prior to disconnecting anything, use a clean shop towel soaked in warm water to wipe the coating of DEF from the components.

Note : Clean any service tools used for this test with warm distilled water before storage.

Disconnect the electrical and DEF lines. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html) If used, remove the service tool extensions.



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the aftertreatment DEF dosing valve. Refer to Procedure 011-059 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html)
- Connect the batteries. See equipment manufacturer service information.

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® service tools required.

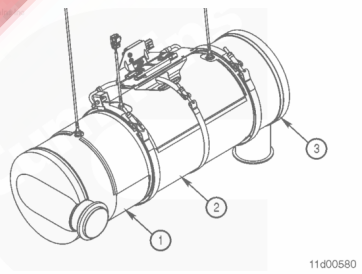
Additional Service Items

- Putty knife
- Anti-seize compound

General Information

⚠ WARNING ⚠

The material captured in a partial flow diesel particulate filter and/or a diesel particulate filter may contain elevated concentrations of metals. Primarily zinc, molybdenum, and possibly polynuclear aromatic hydrocarbons, that may be regulated. These materials must be characterized, handled, and disposed of according to applicable local regulations. In addition, due to the presence of the above-listed chemicals and other potentially toxic components such as oxides of calcium, zinc, phosphorous, silicon, sulfur, and iron, exhaust filter maintenance must be completed only by appropriately trained personnel.



11d00580

⚠ CAUTION ⚠

The aftertreatment diesel oxidation catalyst elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system as damage to the aftertreatment diesel oxidation catalyst element can result.

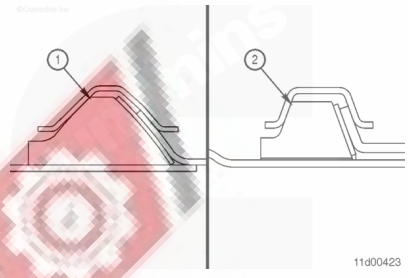
Due to the number of exhaust aftertreatment applications, this procedure has been written to be generic. Illustrations within this procedure will **not** represent all applications.

The aftertreatment system is composed of three sections:

1. Aftertreatment diesel oxidation catalyst
2. Aftertreatment diesel particulate filter
3. Outlet.

Note : The aftertreatment diesel oxidation catalyst is integrated into the inlet of the exhaust aftertreatment system. Use the following procedure for aftertreatment inlet service guidelines. Refer to Procedure 011-049 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-049.html)

A variation in vehicle aftertreatment configuration will drive the aftertreatment to have different flanges. The clamps and gaskets on either end of the aftertreatment SCR catalyst can be different from one another. There are two types of flanged joints, spherical Marman® and full Marman®. The spherical Marman® (1) joints allow a small amount of misalignment an have a rounded cross section. The full Marman® (2) joints are completely rigid and have a more edgy profile.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

During regeneration, exhaust gas temperature can reach 800 °C [1500°F], and exhaust system surface temperature can exceed 700 °C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle has stopped moving. To avoid the risk of fire, property damage, burns, or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

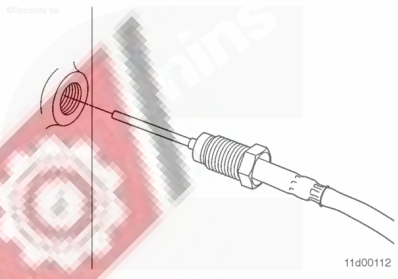
- Disconnect the batteries. See equipment manufacturer service information.
- Mark the direction of exhaust flow to aid in assembly.

- Draw an orientation reference line across each V-band clamp, aftertreatment canister sections, and connection points to the tailpipe. This will aid in lining up the sections and the V-band clamps to their original orientation during installation.
- Remove the mounting straps or bolts from the outlet, if necessary. See equipment manufacturer service information.

Disassemble

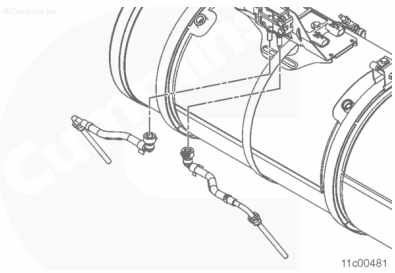
Remove the aftertreatment diesel particulate filter outlet temperature sensor probe. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)

Note : The aftertreatment diesel particulate filter outlet temperature sensor probe **must** be removed prior to aftertreatment outlet removal or damage to the sensor wiring and sensor probe will occur.



Remove the diesel particulate filter outlet differential pressure sensor tube from the diesel oxidation catalyst. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)

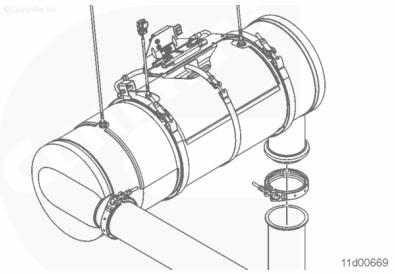
Note : The diesel particulate filter outlet differential pressure sensor tube **must** be removed prior to aftertreatment outlet removal or damage to the sensor tube will occur.



Remove

⚠ WARNING ⚠

This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.



⚠ CAUTION ⚠

The aftertreatment diesel oxidation catalyst elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the

aftertreatment system as damage to the aftertreatment diesel oxidation catalyst element can result.

⚠ CAUTION ⚠

Do not use an air tool to remove the V-band clamp nut. An air tool will damage the threads. Apply thread lubricant to the V-band clamp threads prior to nut removal.

Support the aftertreatment decomposition tube and aftertreatment diesel particulate filter to avoid applying a cantilevered load on the V-band joints.

Remove the V-band clamp used to connect the aftertreatment outlet to the aftertreatment decomposition tube.

Remove the V-band clamp connecting the outlet to the aftertreatment diesel particulate filter.

Remove and discard the gaskets.

Clean and Inspect for Reuse

Inspect the aftertreatment outlet canister for cracks or other damage.

⚠ CAUTION ⚠

Do not use a metallic object to clean the aftertreatment diesel particulate filter (DPF) outlet. This will scratch the surface of the aftertreatment DPF outlet which may cause future excessive diesel exhaust fluid (DEF) crystallization buildup.

Inspect the aftertreatment DPF outlet for DEF deposits.

If buildups are present, carefully scrape them with a non-metallic object to clean the majority of the buildup. Use a pressure washer to remove any remaining buildup.

Note : If crystallization buildup was present, complete a stationary regeneration after installation to make

sure the remaining DEF crystallization has been removed from the aftertreatment system.

Flange Preparation - Use a putty knife to remove any residual gasket material from the flanges on the aftertreatment diesel particulate filter.

Avoid dropping fragments of gasket material into the aftertreatment diesel particulate filter.

Do **not** use compressed air to remove fragments of gasket material that have fallen into the filter during gasket removal.

Do **not** grind on the flange surface, as this can damage the flange and cause the connection to leak.

Inspect the V-band clamps and mounting straps for signs of overextension.

The band **must not** be bent or damaged.

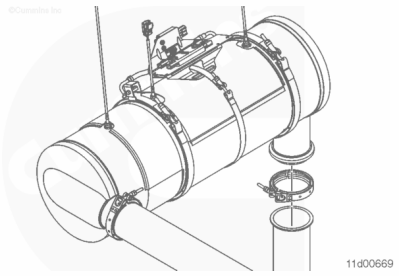
Inspect the V-band clamp and mounting strap threads for damage.

Replace the V-band clamp or mounting strap if damage is found.

Install

⚠ CAUTION ⚠

Do not use an air tool to tighten the V-band clamp. An air tool will damage the threads.



Apply a coat of anti-seize compound on the threads of the V-band clamps.

Note : The gasket and clamp on the outlet end of the aftertreatment outlet canister can be different. See the General Information section of this procedure. Where applicable, install and tighten the full Marman® clamps before the spherical Marman® to account for misalignment in the aftertreatment.

Note : Install a new gasket between the exhaust pipe and aftertreatment outlet.

ANADOLU ISUZU AFTER SALES

Tighten the V-band clamp used to secure the outlet of the aftertreatment to the exhaust pipe, if necessary.

Torque Value: 13.5 n•m [120 in-lb]

Install a new gasket between the outlet and the aftertreatment diesel particulate filter.

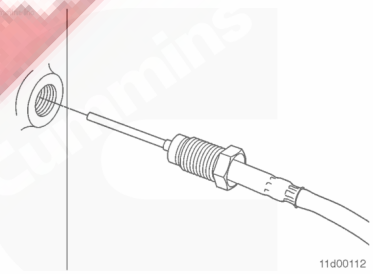
Install the V-band clamp used to connect the outlet to the aftertreatment diesel particulate filter.

Tighten the V-band clamp.

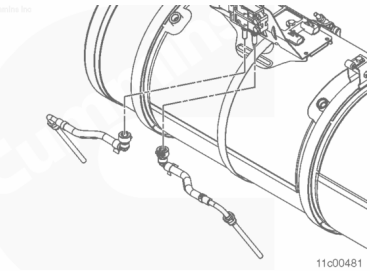
Torque Value: 20 n•m [177 in-lb]

Assemble

Install the aftertreatment diesel particulate filter outlet temperature sensor probe. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)



Install the diesel particulate filter outlet differential pressure sensor tube from the diesel oxidation catalyst. Refer to Procedure 011-047 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-047.html)



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the mounting straps or bolts used to support the outlet, if necessary. See equipment manufacturer service information.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Check for active fault codes. If buildups were present, complete a stationary regeneration to make sure any remaining DEF crystallization has been removed from the aftertreatment system. Continue to monitor for leaks at the exhaust joints.

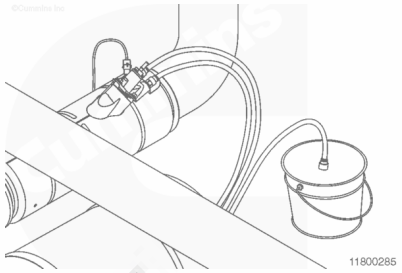
Last Modified: 01-Nov-2016

ANADOLU ISUZU AFTER SALES

Setup

⚠ CAUTION ⚠

Care should be taken when handling and/or disconnecting the diesel exhaust fluid line from the aftertreatment diesel exhaust fluid dosing valve. The intake of the aftertreatment diesel exhaust fluid dosing valve is plastic and can be easily damaged.



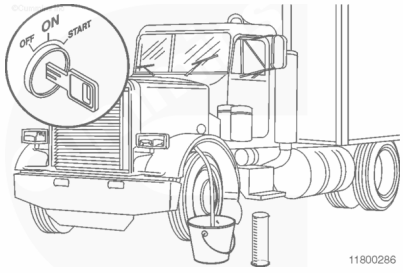
Remove the aftertreatment diesel exhaust fluid dosing valve supply line from the aftertreatment diesel exhaust fluid dosing valve.

Install the diesel exhaust fluid extension line, Part Number 4919574, from the Aftertreatment Diesel Exhaust Fluid (DEF) Doser Shutoff Valve Test Kit, Part Number 4919573.

Obtain a container suitable for collection of the diesel exhaust fluid that exits the aftertreatment diesel exhaust fluid dosing valve supply line. A 3.8 liter [1 gal] bucket is recommended.

Measure

Route the outlet of the diesel exhaust fluid extension line into the collection container.



Turn the keyswitch to the ON position and connect the recommended Cummins® electronic service tool or equivalent.

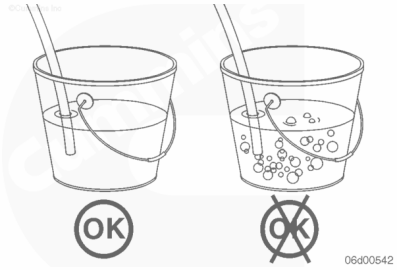
Select the Diesel Exhaust Fluid Doser Pump Override test under the ECM Diagnostic Tests menu.

This test will attempt to prime the dosing system. During this test, diesel exhaust fluid will be drawn from the tank and pumped through the diesel exhaust fluid extension line.

Note : Once the test is initiated it will continue to pump diesel exhaust fluid, even when attempting to stop the test with the electronic service tool. To stop the test, it is necessary to turn the keyswitch to the OFF position.

ANADOLU ISUZU AFTER SALES

Observe the diesel exhaust fluid flow exiting the diesel exhaust fluid extension line while the Override Test is running.



Bubbles are an indication of a leak that allows air to enter the dosing system. If bubbles are present, check the following components for damage or leaks:

- Aftertreatment diesel exhaust fluid dosing unit fittings
- Aftertreatment diesel exhaust fluid dosing unit supply line
- Aftertreatment diesel exhaust fluid tank assembly
- Aftertreatment diesel exhaust fluid tank fittings.

Repair or replace any damaged components.

Turn the keyswitch to the OFF position to end the test.

Note : If this test is run for an extended period of time, Fault Code 1682 will become active. Limit the test time to 5 minutes or less.

Finishing Steps

- Remove the aftertreatment diesel exhaust fluid extension line.
- Connect that aftertreatment diesel exhaust fluid dosing valve supply line.
- Discard the collected diesel exhaust fluid. Dispose of the collected diesel exhaust fluid in accordance with local environmental regulations.
- Operate the engine and check for leaks.

Select Service Tools

Recommended Cummins® Service Tools

- Anti-seize compound, Part Number 3824879, or equivalent

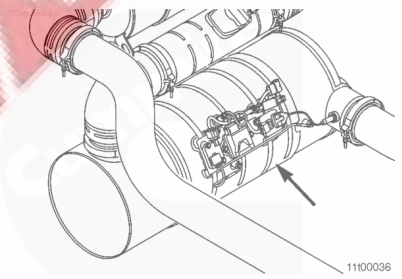
Additional Service Items

- No additional service items required.

General Information

⚠ WARNING ⚠

The exhaust and exhaust components can remain hot after the engine has been shut down or secured. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they might come in contact with hot exhaust or exhaust components.



⚠ CAUTION ⚠

The catalyst elements contained in the aftertreatment system are made of brittle material. Do not drop or strike the side of the aftertreatment system, as damage to the catalyst element can result.

Note : Due to the number of various exhaust aftertreatment applications, this procedure has been written to be generic. **Not** all illustrations within this procedure will represent the application being serviced.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ CAUTION ⚠

The aftertreatment diesel particulate filter and catalyst can remain hot for long periods of time after the engine has stopped.

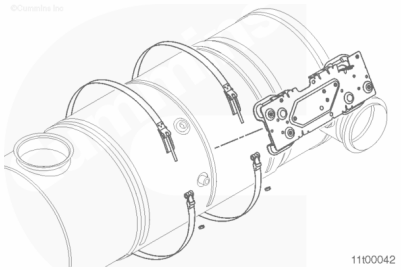
- Disconnect the batteries. See equipment manufacturer service information.
- Mark the orientation and location of the bracket before it is removed, to aid installation.
- Disconnect the aftertreatment interface harness from the original equipment manufacturer (OEM) wiring harness connection.
- Remove the NOx sensor probe from the aftertreatment selective catalytic reduction (SCR) catalyst body. Refer to Procedure 019-451 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-451.html)
- Remove the aftertreatment temperature sensor probes from the aftertreatment SCR catalyst body. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)

Note : The aftertreatment SCR catalyst temperature sensor interface module **must** be oriented in the same location when it is installed. Make sure to check the orientation.

Remove

Remove the nuts on the aftertreatment SCR catalyst temperature sensor interface module mounting bracket straps.

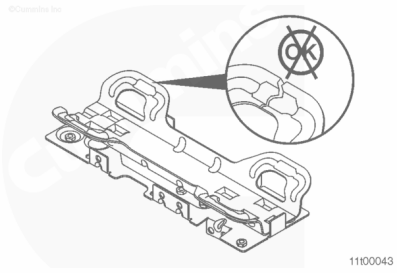
Remove the aftertreatment SCR catalyst temperature sensor interface module mounting bracket.



Clean and Inspect for Reuse

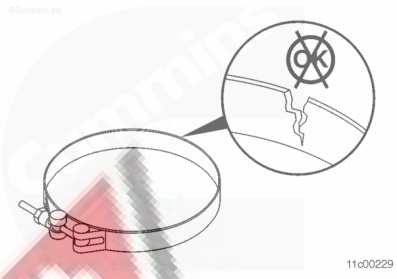
Inspect the aftertreatment SCR catalyst temperature sensor interface module mounting bracket for cracks, damaged threads, or broken studs.

Replace the aftertreatment SCR catalyst temperature sensor interface module mounting bracket.



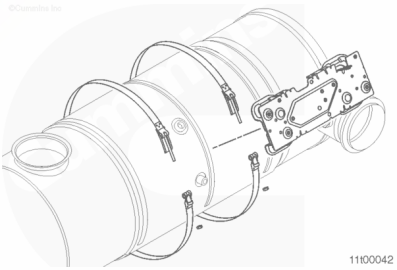
Inspect the aftertreatment SCR catalyst temperature sensor interface module mounting bracket straps for cracks, damaged threads, or bends.

Replace the aftertreatment SCR catalyst temperature sensor interface module mounting bracket straps if they are damaged.



Install

Note : Make sure the aftertreatment SCR catalyst is oriented so the aftertreatment SCR catalyst temperature sensor interface module mounting bracket is installed in the same orientation noted during removal.



Install the aftertreatment SCR catalyst temperature sensor interface module mounting bracket and straps. Make sure to align the mounting bracket by using the reference mark made during removal.

Apply a coating of anti-seize compound, Part Number 3824879, or equivalent, to the threads of the aftertreatment SCR catalyst temperature sensor interface module mounting bracket straps.

Install the aftertreatment SCR catalyst temperature sensor interface module mounting bracket and strap. Make sure to align the mounting bracket with the reference mark made during removal.

Apply a coating of anti-seize compound to the threads of the aftertreatment diesel particulate filter differential pressure sensor mounting bracket strap.

Tighten the nuts on the aftertreatment SCR catalyst temperature sensor interface module mounting bracket.

Torque Value: 7 n•m [62 in-lb]

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the aftertreatment temperature sensor probes into the SCR catalyst body. Refer to Procedure 019-449 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-449.html)
- Install the aftertreatment outlet NOx sensor probe. Refer to Procedure 019-451 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-451.html)
- Connect the aftertreatment interface harness to the OEM wiring harness connection.
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for proper operation.

ANADOLU ISUZU AFTERSALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® service tools required.

Additional Service Items

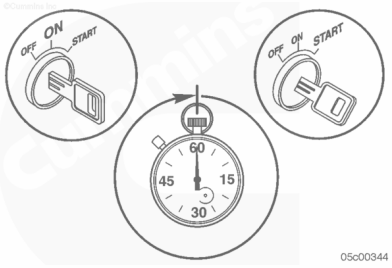
- No additional service items required.

General Information

If the aftertreatment diesel exhaust fluid (DEF) dosing system has been serviced or repaired, it will be necessary to prime the DEF dosing system, in order to check for proper operation.

Setup

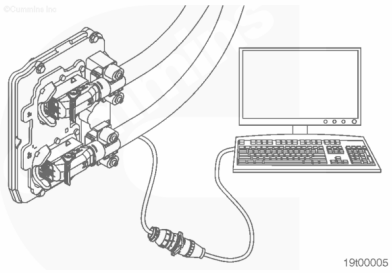
Note : It can be necessary to allow the aftertreatment system time to cool, to allow for accessibility to check for leaking components.



- Make sure the DEF tank is full of DEF. See equipment manufacturer service information.
- Make sure the DEF is **not** frozen. If the DEF is frozen, it will be necessary to run the engine to allow the system to thaw.
- Make sure all DEF dosing system lines are properly connected to the DEF tank, DEF dosing unit, and DEF dosing valve. See equipment manufacturer service information.
- Connect INSITE™ electronic service tool.

Prime

With the keyswitch ON and the engine **not** running, select the Aftertreatment Diesel Exhaust Fluid System Leak Test found under the ECM diagnostics test menu in INSITE™ electronic service tool.



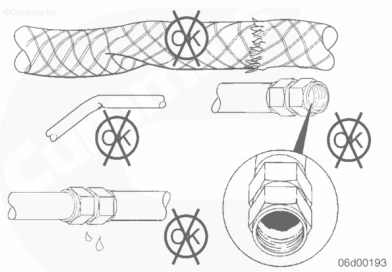
This test will cause the DEF dosing unit to draw DEF from the tank and pressurize it in the DEF dosing valve supply line. During this test, the dosing unit will continuously run and all unused DEF will return to the tank. An audible pumping noise will be noticeable during the test.

During the initialization of this test, a note will pop up on the screen, indicating the system has reached a prime state.

When the test is started, the dosing system will prime. During this process the aftertreatment DEF dosing valve will be held in the closed position. As a result, DEF droplets can potentially be observed exiting the tip of the dosing valve. This is a normal operating characteristic. Do **not** remove the injector.

Inspect

Note : If the system is unable to prime due to leaks, it will be necessary to turn the keyswitch OFF in order to stop the dosing unit. The dosing unit can **not** be stopped using INSITE™ electronic service tool.

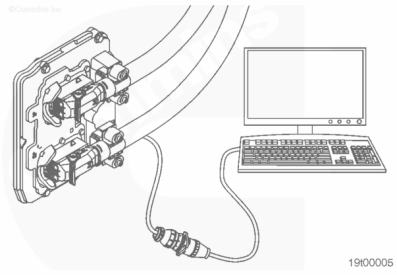


While the test is running, inspect all DEF lines, fittings, and connections for external leaks. Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html) Refer to Procedure 011-059 in Section 11 (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html). See equipment manufacturer service information.

Repair and replace any leaking component(s). Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html) Refer to Procedure 011-059 in Section 11 (/qs3/pubsys2/xml/en/procedures/425/425-011-059.html). See equipment manufacturer service information.

Note : If the system fails to prime, a key cycle will be required before attempting to run the aftertreatment DEF system leak test again.

Note : The aftertreatment DEF system leak test can **only** be attempted twice consecutively. A key cycle will be required before attempting to run the aftertreatment DEF system leak test again after two attempts.



If the system is able to successfully prime, a pop-up message will appear in INSITE™ electronic service tool to notify the technician.

Upon completion of inspecting the lines, fittings, and connections for leaks, press the STOP button in INSITE™ electronic service tool. The dosing unit will then purge the system of DEF. An audible purging noise will be noticeable.

If the test is **not** STOPPED using INSITE™ electronic service tool, it will continue to pump for 20 minutes and then automatically purge the system of DEF.

If the system can **not** build pressure, it will attempt to prime multiple times before flagging a fault code.

If any fault codes occur while running this test, see the appropriate fault code troubleshooting tree.

Finishing Steps

- During the test, a small quantity of DEF is sprayed into the aftertreatment decomposition tube. After completion of the test, it is necessary to run the engine at high idle for 5 minutes in order to prevent DEF deposits from forming in the aftertreatment decomposition tube.
- Check for fault codes.

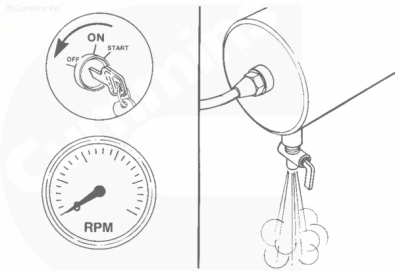
Initial Check

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

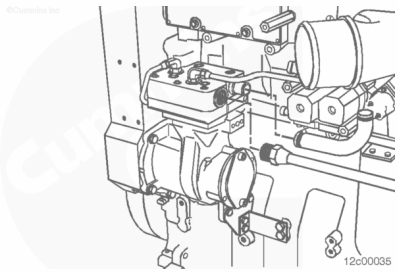


Shut the engine OFF.

Open the drain cock on the wet tank to release the compressed air from the system.

⚠ WARNING ⚠

Air discharge lines can be very hot. Make sure the lines are cool before touching to reduce the possibility of personal injury.

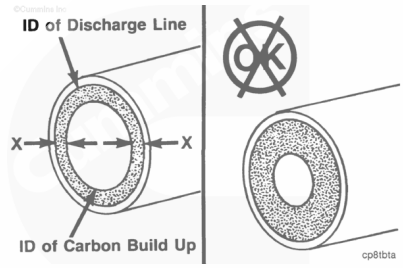


Remove the air inlet and outlet connections from the air compressor.

Measure the total carbon buildup thickness inside the air discharge line as shown.

Note : The carbon buildup thickness **must not** exceed 1.6 mm [0.06 in].

ANADOLU ISUZU PARTS SALES



⚠ WARNING ⚠

The air discharge line must be capable of withstanding extreme heat and pressure to prevent personal injury and property damage. Refer to the manufacturer's specifications.

GRAPHIC NOT FOUND

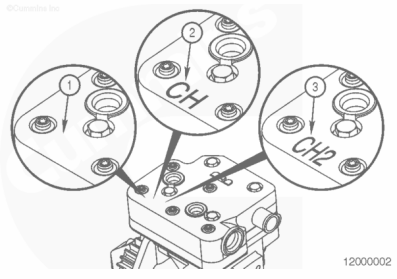
Note : If the total carbon deposit thickness exceeds specification, remove and clean, or replace, the air discharge line. See equipment manufacturer service information for manufacturer specifications.

Continue to check for carbon buildup in the air discharge line connections up to the first connection or wet tank.

Clean or replace any lines and fittings with carbon buildup thicker than 1.6 mm [0.06 in]. See equipment manufacturer service information for cleaning or replacement instructions.

Preparatory Steps

Check the marking on the air compressor head before cleaning or replacing the cylinder head.



Repair Direction:

1. No marking: Perform On-Engine Repair.
2. CH marking: Perform Off-Engine Repair.
3. CH2 marking: Replace the air compressor cylinder head. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

ANADOLU ISUZU PARTS SALES

Clean

On-Engine Repair

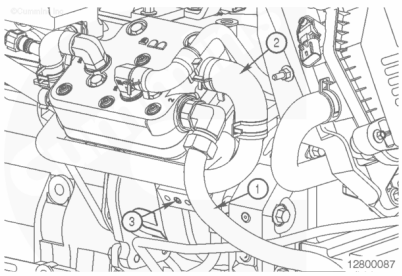
Use Air Compressor Cleaning Kit, Part Number 2892280, to clean and remove internal carbon deposits and other foreign material from the air compressor cylinder head.

The items below are **not** included in Air Compressor Cleaning Kit, Part Number 2892280, but are required to perform the repair.

- Regulated shop air 621 kPa [90 psi]
- Automatic transmission fluid
- Shop rags, and a 19 liter [5 gal] bucket
- INSITE™ electronic service tool.

Park vehicle on a level surface and in an area where it is safe to idle for an extended period of time. Chock the vehicle wheels. Completely drain the vehicle air system.

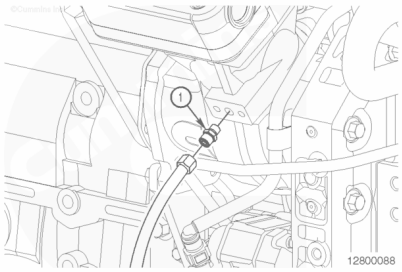
Remove the air compressor discharge line (1), air compressor intake line (2), and air governor signal line (3) at the air compressor.



Install and tighten the M10 connector (1) into the unloader port of the air compressor housing.

Install and tighten the unloader control valve hose to the M10 connector installed into the air compressor housing.

Note : Some air compressors have two unloader ports in the air compressor housing. Make sure one port is plugged with an appropriate pipe plug.



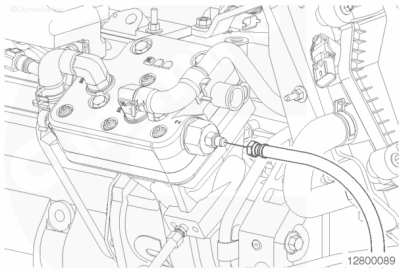
⚠ CAUTION ⚠

While cleaning the air compressor cylinder head, do NOT install the original intake or discharge plumbing. Only use the intake and discharge lines and fitting

ANADOLU ISUZU AFTER SALES

supplied with the air compressor cleaning kit during this procedure.

Install the discharge line and clamp from Air Compressor Cleaning Kit, Part Number 2892280, onto the discharge port fitting on the air compressor cylinder head.

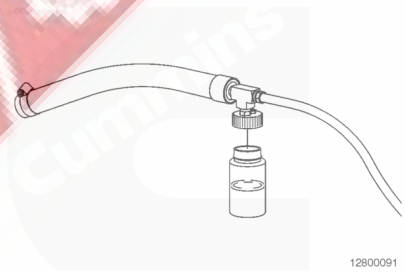


Place the discharge line into a 19 liter [5 gal] bucket. Cover with several oil absorption pads.

Pour 89 ml [3 fluid ounces] of automatic transmission fluid into the dispensing bottle.

Install the dispensing bottle onto the dispensing hose assembly.

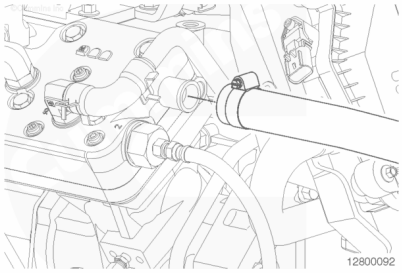
Note : For best results, use Dexron® III automatic transmission fluid or equivalent.



Install and tighten the dispensing hose assembly. Clamp to the intake port of the air compressor cylinder head.

Connect regulated shop air at 621 kPa [90 psi] to the air compressor cleaner.

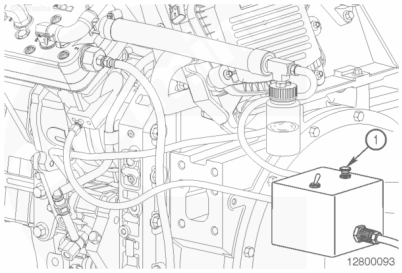
Note : The next three steps will happen quickly. For best results, read the remaining instructions prior to continuing with the cleaning procedure. Do **not** cycle the unloader until all 89 ml [3 fl oz] of automatic transmission fluid have been applied.



Start the engine. Let it idle for 1 minute.

The air compressor can draw in the automatic transmission fluid naturally (no forced air applied). If the fluid is **not** pulled from the dispensing bottle, press and hold the ‘Clean’ button (1) on the air compressor cleaner until all 89 ml [3 fluid ounces] of automatic transmission fluid have been dispensed.

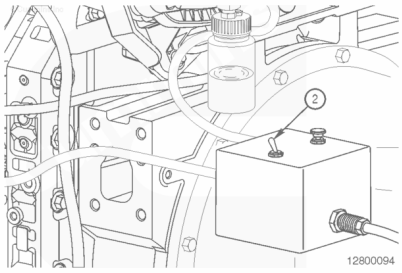
Shut the engine OFF.



Pour 89 ml [3 fl oz] of automatic transmission fluid into the dispensing bottle. Install back onto the dispensing hose assembly.

Toggle the ‘Unloader’ switch (2) ON to apply air pressure to the unloader signal port.

Do **not** relieve pressure at the unloader valve at this time.



Start the engine.

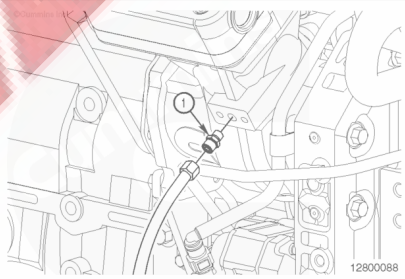
Immediately depress and hold the ‘Clean’ button on the air compressor cleaner until all 89 ml [3 fl oz] of automatic transmission fluid have been dispensed. Continue to hold the ‘Clean’ button down for an additional 10 to 20 seconds.

Note : A heavy mist of automatic transmission fluid will be coming from the discharge hose.

Shut the engine OFF.

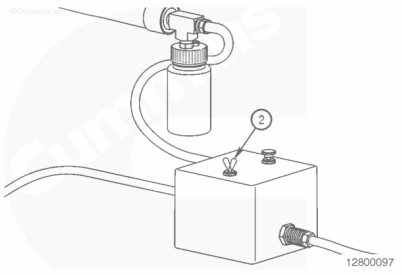
Remove the discharge hose assembly from the air compressor cylinder head intake port.

Start the engine.

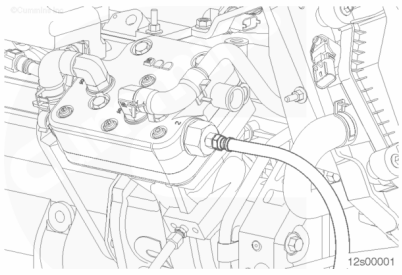


Continuously cycle the ‘Unloader’ switch on the air compressor cleaner for up to 25 cycles.

Note : When the air compressor cylinder head has been adequately cleaned, there should be an audible difference between loaded and unloaded states of the air compressor. Installation of a 1.5 meter [5 ft] length of rubber hose over the intake port can help to audibly identify when the unloader is functioning properly.



Verify constant suction at the air compressor cylinder head intake port when the air compressor is loaded (unloader switch OFF), and fluctuating air flow when unloaded (unloader switch ON). If constant suction is **not** present in a loaded state, repeat the cleaning process one additional time.



⚠ CAUTION ⚠

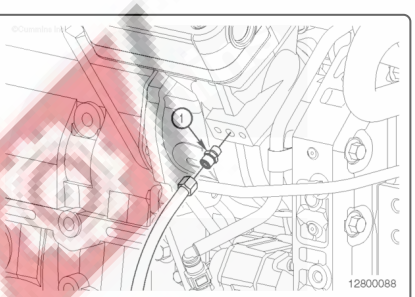
ANADOLU ISUZU
PAPER SALES

Operating the air compressor with no filter in place at the intake port can allow dust or debris to enter the air compressor. A rubber hose should be placed over the intake port and routed to an area free of airborne dust and debris.

With the discharge hose still installed, relieve the pressure at the unloader port (switch OFF), and operate the engine at high idle for 3 to 5 minutes to remove any excess automatic transmission fluid.

Allow engine to return to low idle. Shut the engine OFF.

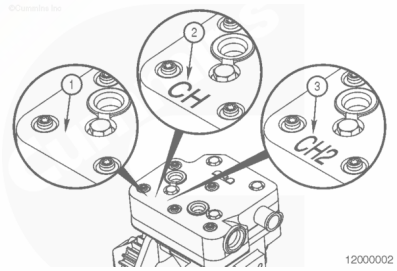
Remove the unloader control valve hose and M10 connector (1).



Use an engraving pen and mark the letters CH below the head bolt as shown.

Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)

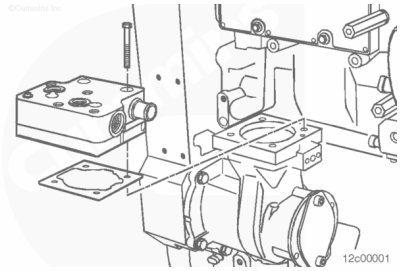
If the air compressor does **not** function properly, perform the Off-Engine Repair.



Off-Engine Repair

⚠ WARNING ⚠

Use skin and eye protection when handling caustic solutions to reduce the possibility of personal injury.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

Do not use a sharp object to remove carbon. The sealing surfaces can be damaged.

ANADOLU ISUZU MASTER SALES

⚠ CAUTION ⚠

Avoid getting debris and solvents into the clearance between the piston and bore.

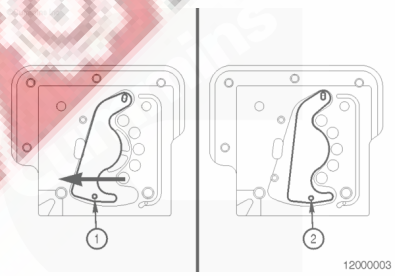
⚠ CAUTION ⚠

Avoid the use of abrasive products similar to “Scotch Brite™” because any abrasive grit left after cleaning will shorten the life of the air compressor.

Remove the compressor head and valve assembly. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer’s recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



Remove carbon from the compressor head and valve assembly components. Use a non-abrasive solvent and a non-metallic brush.

Note : Using an abrasive solvent like carburetor cleaner can lead to further lubrication loss in the air compressor head.

Blow out passages with compressed air.

Verify the unloader slider plate is fully closed when at rest.

Remove the unloader slider plate and verify proper unloader piston travel. Use a stiff wood handle or equivalent non-abrasive device to move the unloader piston by pushing back on the unloader slider plate guide pin in the direction of the arrow as indicated. Be careful **not** to damage the aluminum surface of the head or drop debris into the open slot in which the guide pin travels.

Note : When released, the unloader piston should return to the loaded position (closed) with a quick, smooth motion and audible snap.

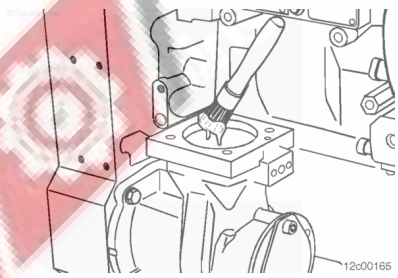
If the unloader piston does **not** return completely to the loaded position with an audible snap; fill the open slot between the unloader slider plate guide pin and the closed

position of the unloader position with automatic transmission fluid.

Actuate the unloader back and forth for three periods of 10 seconds. If the unloader is not free after 10 seconds, fill the open slot again with automatic transmission fluid each time until the piston is free and returns to the loaded position (closed) with a quick, smooth motion and audible snap.

If the unloader piston does **not** return to the loaded position with a quick smooth motion and an audible snap when released after performing the steps above, replace the cylinder head.

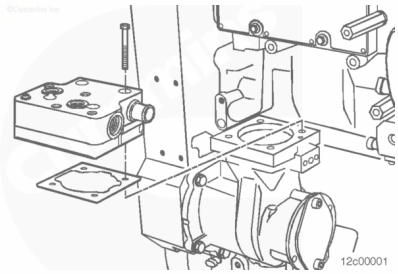
Clean the compressor cylinder.



Rotate the crankshaft until the piston is at the top of the cylinder bore.

Remove any accumulated carbon and varnish by careful scraping and light application of solvents.

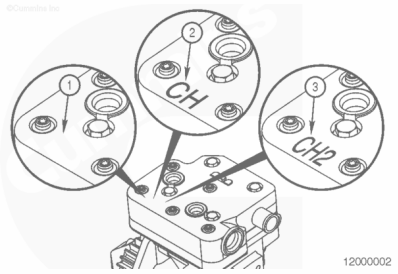
Using an engraving pen, mark the number 2 next to the CH marking already engraved on the cylinder head.



Install the compressor head and valve assembly.

Install the compressor head and valve assembly. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

Perform the Air Compressor Diagnostic Test to verify the air compressor is functioning properly. Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)



If the air compressor does **not** function properly, replace the air compressor cylinder head. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

ANADOLU ISUZU
AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Removal tool, Part Number 4918878

Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

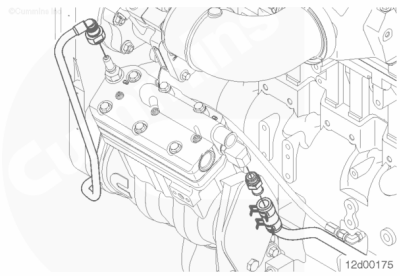
Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the starting motor, if necessary. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
- Remove the fuel filter, if necessary. Refer to Procedure 006-015 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-015-tr.html)

Remove



Note : The air compressor cooling lines illustrated can differ depending on the compressor installed. Some options will have the air compressor coolant return line routed behind the engine and plumbed to the water inlet connection. In this case, the coolant return line is composed of three different segments, all connected by quick-disconnect fittings.

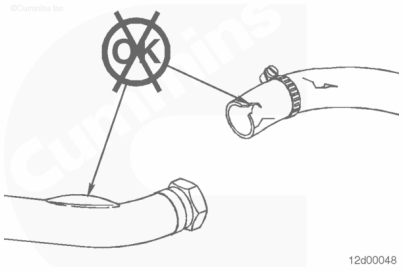
Remove the coolant supply and return lines from the air compressor cylinder head.

Remove the coolant supply line from the engine cylinder head and coolant return line from the water inlet connection.

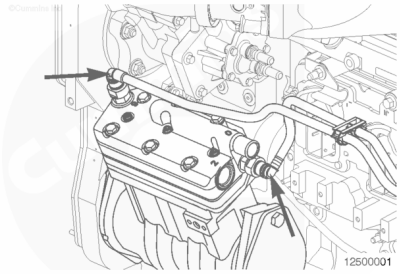
Note : If equipped with quick-disconnect lines, remove the quick-disconnect lines by pressing in the locking tangs on both sides of the quick-disconnect fitting. To aid in removal, slide removal tool, Part Number 4918878, over the locking tangs. Make sure the tool is removed from the fitting as soon as possible after the line is disconnected. Inadvertently leaving the tool in place can result in leaks.

Inspect for Reuse

Inspect the coolant hoses and coolant lines for restriction of coolant flow.



Install



Note : The air compressor cooling lines illustrated can differ depending on the compressor installed. Some options will have the air compressor coolant return line routed behind the engine and plumbed to the water inlet connection. In this case, the coolant return line is composed of three different segments, all

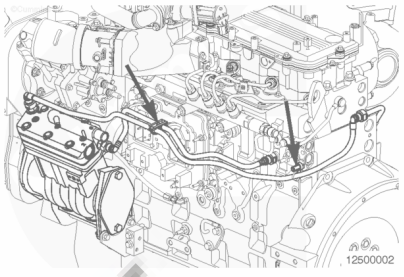
ANADOLU ISUZU AFTER SALES

connected by quick-disconnect fittings. The torque specification for all options remains the same.

Install the coolant supply and return lines onto the air compressor cylinder head.

Install the coolant supply line onto the engine cylinder head and coolant return line onto the water inlet connection.

Torque Value: 24 n•m [212 in-lb]



If equipped with quick-disconnect lines, install the quick-disconnect lines by pushing the quick-disconnect fitting onto the male union until it clicks.

GRAPHIC NOT FOUND

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the fuel filter, if removed. Refer to Procedure 006-015 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-015-tr.html)
- Install the starting motor, if removed. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Disconnect the batteries. See equipment manufacturer service information.
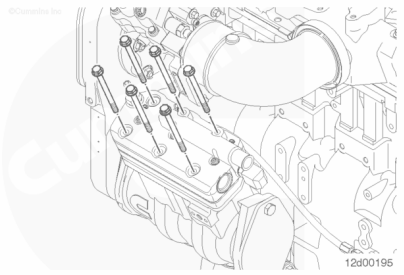
- Drain the coolant. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Remove the air governor or air governor signal line, if necessary. See equipment manufacturer service information.
- Remove the air compressor coolant lines. Refer to Procedure 012-004 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-004.html)

Remove

Note : During the removal of the air compressor cylinder head, it is **not** necessary to remove the three M6 internal hex capscrews.



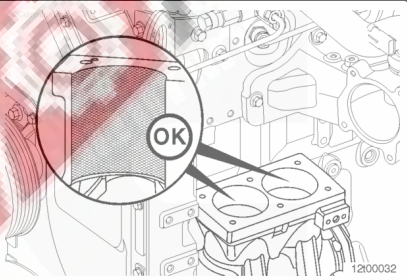
Remove the six M8 cylinder head bolts.

Remove the air compressor cylinder head and gasket.

Inspect for Reuse

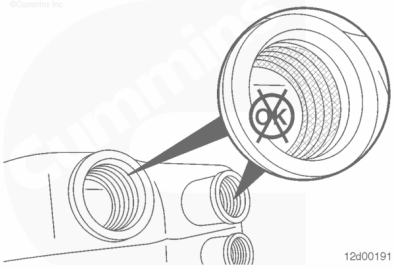
⚠ CAUTION ⚠

Do not use an abrasive cleaning tool on any surface of the air compressor cylinder head. If an abrasive cleaning tool is used, the air compressor cylinder head can become damaged.

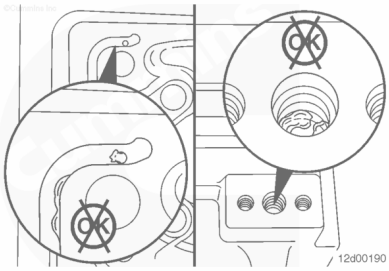


Inspect the air compressor cylinder bores for damage. Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)

Inspect the intake and exhaust ports for excessive carbon buildup. Refer to Procedure 012-003 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-003.html)



Inspect the air governor signal channel in the air compressor cylinder head. The channel **must** appear as a clean aluminum surface.



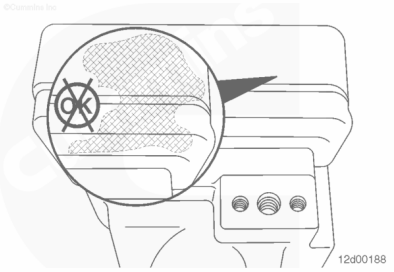
The air compressor cylinder head **must** be replaced if there is any sign of rust, dirt, or exhaust gas recirculation debris present.

Note : If rust is found in the air governor signal channel, it is the result of poor system maintenance. Check for proper operation of the air dryer and wet tanks. See equipment manufacturer service information.

Inspect the air compressor cylinder head for signs of a coolant leak.

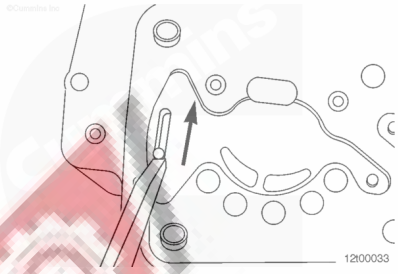
A coolant leak will be identified by an area of engine paint appearing to have been washed away. White crystalline clusters of material are **not** a sign of a coolant leak.

If a leak is found, replace the air compressor cylinder head.



Verify the unloader slider plate is fully closed when at rest.

Remove the unloader slider plate and verify proper unloader piston travel. Use a stiff wooden handle or equivalent non-abrasive device to move the unloader piston by pushing back on the unloader slider plate guide pin in the direction of arrow as indicated. Be careful **not** to damage the aluminum surface of the head or drop debris into the open slot in which the guide pin travels.



Note : When released, the unloader piston should return to the loaded position with a quick, smooth motion and an audible snap.

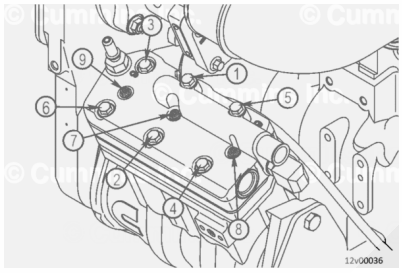
If the unloader piston does **not** return to the loaded position with a quick, smooth motion and audible snap, see the table below for repair direction.

Unloader Movement Check	
Guide Pin Action	**Repair Direction**
Guide pin can be moved to loaded (closed) position by hand.	Spring is broken or weak. Replace the cylinder head. Refer to Procedure 012-003 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-003.html)
Guide pin does **not** return or slow to return to loaded position.	

Install

Note : If a new head assembly is being installed, see the instructions provided in the new head assembly kit.

Assemble the air compressor using a new gasket and capscrews.



Install the head and gasket to the air compressor body.

Install the six 8 mm capscrews. Tighten in the sequence illustrated.

Tighten the capscrews.

Step	Capscrew	Torque	Rotation Degrees
1	1	25 N•m [221 in-lb]	
2	2	25 N•m [221 in-lb]	
3	3	25 N•m [221 in-lb]	
4	4	25 N•m [221 in-lb]	
5	5	25 N•m [221 in-lb]	
6	6	25 N•m [221 in-lb]	
7	1		270 degrees
8	2		180 degrees
9	3		180 degrees
10	4		180 degrees
11	5		270 degrees
12	6		180 degrees
13	7	7 N•m [62 in-lb]	
14	8	7 N•m [62 in-lb]	
15	9	7 N•m [62 in-lb]	
16	7		180 degrees
17	8		135 degrees
18	9		180 degrees

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the air governor or air governor signal line, if necessary. See equipment manufacturer service information.
- Install the air compressor coolant lines. Refer to Procedure 012-004 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-004.html)
- Fill the cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine. Check for leaks.

Last Modified: 14-Apr-2020

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

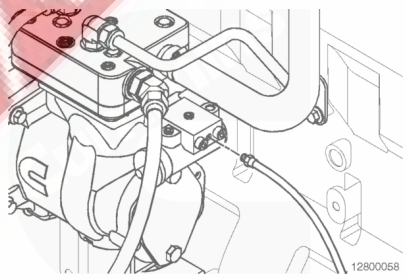
Additional Service Items

- No additional service items required.

Preparatory Steps

⚠ WARNING ⚠

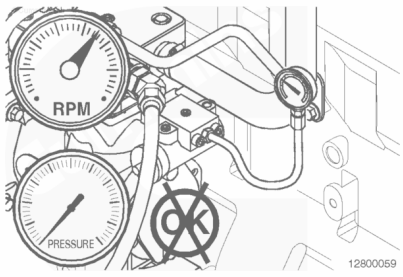
Air pressure must be released from the system before removing the air governor. The governor can be under pressure and cause personal injury.



Disconnect the air governor or air governor signal line from the air compressor.

Operate the engine to activate the air compressor.

If the air system pressure does **not** rise, the unloader valve assembly is malfunctioning. Refer to Procedure 012-003 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-003.html)

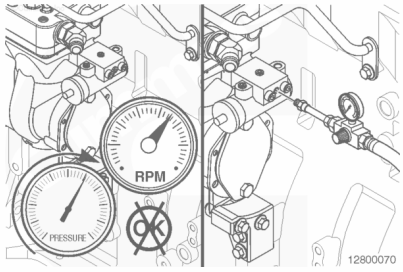


If the air compressor has multiple air governor unloader ports, install a pipe plug into one of the ports, and a shop air fitting into another unloader port.

Connect a regulated shop air hose to the fitting in the unloader port.

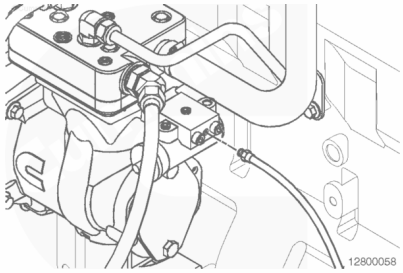
Operate the engine to activate the air compressor.

When the air system pressure has reached 586 kPa [85 psi], apply 698 kPa [100 psig] of shop air pressure to the unloader port. If the system air pressure continues rising, the



unloader valve assembly is malfunctioning. Refer to Procedure 012-003 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-003.html)

Connect the original equipment manufacturer (OEM) air governor signal line to the air compressor unloader port.



Operate the engine to activate the air compressor. Verify the system still builds pressure properly.

If the air system pressure continues to build beyond the governed point, the air governor is malfunctioning.

- Refer to Procedure 012-018 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-018.html)
- Refer to Procedure 012-017 in Section 12. (/qs3/pubsys2/xml/en/procedures/100/100-012-017.html)

- No additional service items required.

Pressure Test

⚠ WARNING ⚠

The external pressure tank used must meet SAE J10 and FMVSS121 standards, and have a safety pressure relief valve which opens between 1034 to 1207 kPa [150 to 175 psi]. Failure to use the proper pressure vessel and plumbing can result in property damage and serious personal injury.

Air Compressor Diagnostic Test

1. Park vehicle on a level surface and in an area where it is safe to idle for an extended period of time. Chock the vehicle wheels or use an appropriate anti-roll device to stabilize the vehicle.
2. Drain the vehicle air system.
3. Remove the air discharge hose and air governor signal hose from the air compressor.
4. Plumb an air discharge hose from the air compressor into an external pressure tank. The external pressure tank **must** be equipped with a 1034 kPa [150 psi] pressure gauge and 1034 kPa [150 psi] pressure relief valve. Make sure the fittings are installed with appropriate thread sealant and do **not** leak.

Start the engine. Operate at rated engine speed.

Note : Once the external pressure tank pressure reaches 862 kPa [125 psi], shut the engine OFF. Depending on the size of the external tank and the diameter/length of the discharge hose being used, the buildup time will vary.

For example, a single cylinder (318 cc) compressor filled 42 liters [11 gal] tank to 862 kPa [125 psi], using a (#10 x 6ft length) discharge hose in 90 seconds. This was considered in specification for this setup.

Verify the air compressor will build pressure in the external tank. If air pressure successfully builds to 862 kPa [125 psi], the air compressor functions properly. Remove the external air discharge hose from the air compressor and install the vehicle air discharge hose and air governor signal hose to the compressor. See the symptom tree being utilized to inspect the rest of the air system components for leaks. Verify proper operation.

If the air compressor fails to build to 862 kPa [125 psi], the air compressor is malfunctioning and the cylinder head needs to be repaired, based on the marking scribed on the head. Refer to Procedure 012-003 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-003.html)

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

Wear safety glasses or a face shield, as well as protective clothing, to prevent personal injury when using a steam cleaner or high-pressure water.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ WARNING ⚠

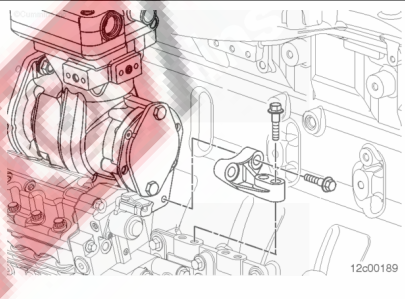
Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.

- Disconnect the batteries. See equipment manufacturer service information.
- Drain the engine cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)

- Clean the air compressor. Use steam. Dry with compressed air.
- Remove the coolant lines. Refer to Procedure 012-004 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-004.html)
- Remove the air connections from the air compressor. Refer to Procedure 012-003 in Section 12 (/qs3/pubsys2/xml/en/procedures/425/425-012-003.html).
- Remove or disconnect the air governor. See equipment manufacturer service information.
- Remove any driven equipment from the back of the air compressor, if equipped.

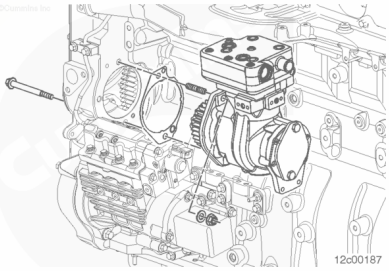
Remove

Remove the air compressor support bracket and capscrews.



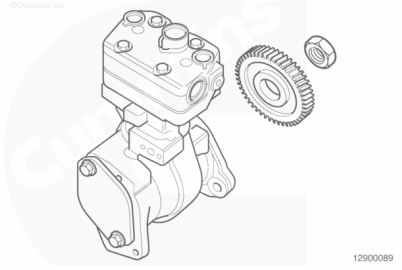
Remove the mounting nut, capscrew, and air compressor.

Discard the gasket.



Disassemble

Note : Replacement Knorr-Bremse™ air compressors are shipped without an air compressor drive gear. If replacing the air compressor or if the air compressor drive gear is damaged, remove the drive gear from the air compressor.



Remove the air compressor drive gear mounting fastener.

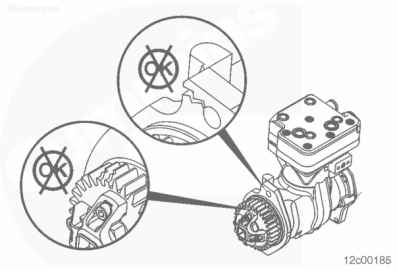
Use a suitable gear puller or bearing separator, such as Part Number 3375326, or equivalent, to remove the air compressor drive gear.

ANADOLU ISUZU AFTER SALES

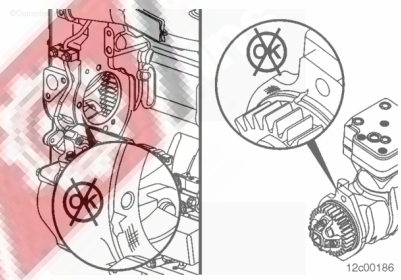
Time

Inspect the air compressor housing for cracks or other damage.

Inspect the air compressor drive gear for cracks or other damage.



Make sure the gasket surfaces of the front gear housing and air compressor are clean and **not** damaged.

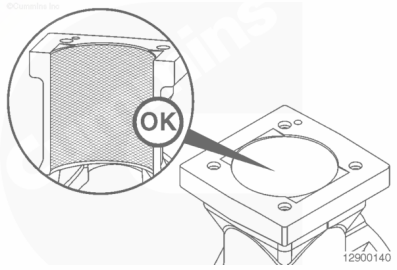


Remove the air compressor cylinder head if it is **not** already removed. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

Inspect the inside circumference for vertical scratches deep enough to be felt with a fingernail.

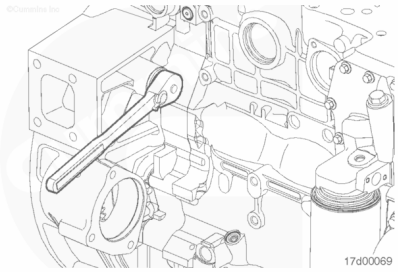
If a fingernail catches in the scratch, the air compressor **must** be replaced.

Inspect the inside circumference for scuffing, scoring, or polishing.

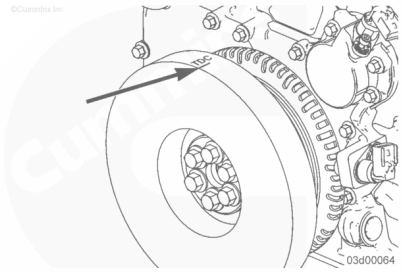


Note : To make sure the air compressor does **not** contribute to engine vibrations when installed, the air compressor **must** be properly timed to the engine.

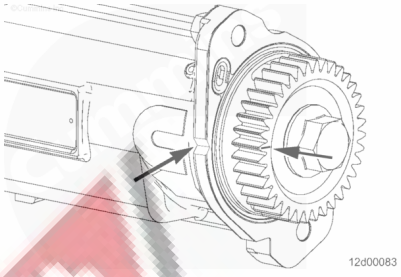
Use barring tool, Part Number 3824591, or equivalent, to rotate the crankshaft until the number 1 is at top dead center (TDC).



Align the vibration damper so the TDC indicator on the vibration damper is at the 12 o'clock position.

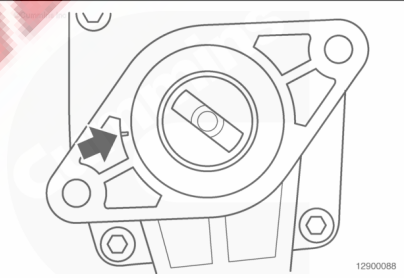


Note : If no TDC mark is present on either the vibration damper or the crankshaft speed indicator ring, align the large gap in the crankshaft speed indicator ring to the 5 o'clock position. The dowel pin can also be visible in the 9 o'clock position.



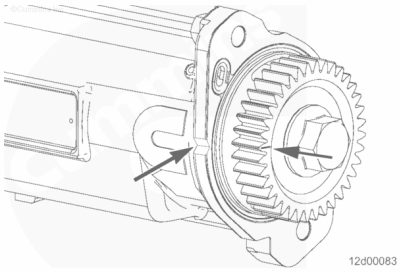
Wabco™ Air Compressors

Set the timing mark on the air compressor gear to the 9 o'clock position when looking at the gear. It **must** point at the casting depression on the side of the air compressor mounting flange.



Knorr-Bremse™ Air Compressors

Set the air compressor to TDC by aligning the two timing marks on the rear of the compressor and on the rear drive.



ANADOLU ISUZU AFTER SALES

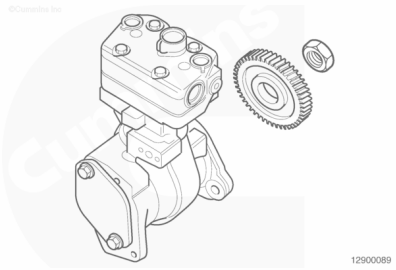
Assemble

Note : Make sure the drive gear and air compressor drive shaft nose are clean and free of any oil before installing the gear on the air compressor driveshaft.

Install the drive gear onto the air compressor drive shaft.

Install the air compressor drive gear mounting fastener. Tighten.

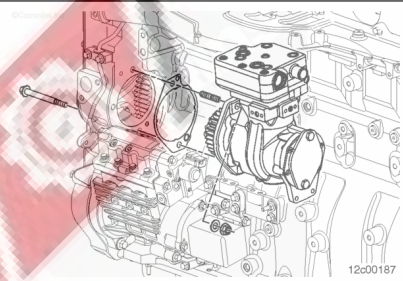
Torque Value: 165 n•m [122 ft-lb]



Install

Install the air compressor, gasket, mounting nut, and capscrew onto the front gear housing.

Note : If the stud is removed, use Loctite®, Part Number 3824040, or equivalent, and install the stud.



Tighten the capscrews.

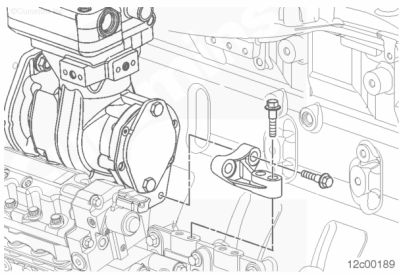
GRAPHIC NOT FOUND

Torque Value: 81 n•m [60 ft-lb]

Tighten the capscrews again.

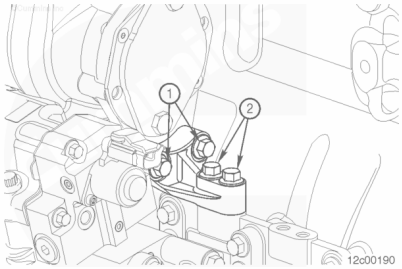
Torque Value: 81 n•m [60 ft-lb]

Install the air compressor mounting brace and four capscrews on the block beneath the air compressor. Start threading all four capscrews.



Tighten the capscrews in the sequence shown on the fuel pump support bracket and air compressor.

Torque Value: 61 n•m [45 ft-lb]



ANADOLU ISUZU AFTER SALES

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

- Install any driven equipment removed to the back of the air compressor, if equipped.
- Install or connect the air governor. See equipment manufacturer service information.
- Install the air connections to the air compressor. Refer to Procedure 012-003 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-003.html)
- Install the coolant lines. Refer to Procedure 012-004 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-004.html)
- Fill the engine cooling system. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Connect the batteries. See equipment manufacturer service information.
- Operate the engine to activate the air compressor. Check for leaks.

Last Modified: 27-Feb-2018

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® service tools required.

Additional Service Items

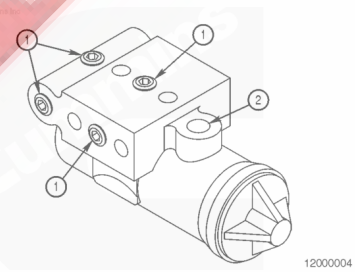
- No additional service items required.

Inspect for Reuse

Verify the air governor signal line is plumbed correctly to the unloader port on the air compressor.

Disconnect and inspect the line for kinks, cuts, nicks or plugging inside the line.

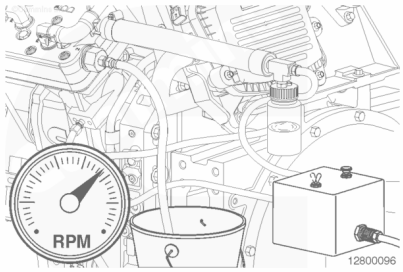
Verify all unused ports (1) on the air governor are plugged except the exhaust port. The exhaust port (2) **must** be vented to the atmosphere at all times.



Activate the air compressor and allow the air pressure to buildup.

If pressure is reading below 125 psi according to the dash gauge, relieve 25 psi of pressure by applying the vehicle brakes to see if the air compressor starts to pump again.

If the air compressor only pumps to the level it was before, the air governor needs to be inspected for proper operation. See equipment manufacturer service information.



ANADOLU ISUZU
AFTER SALES

Last Modified: 24-Oct-2016

Select Service Tools

Recommended Cummins® Service Tools

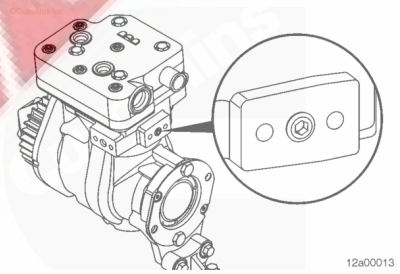
- No Cummins® Service Tools required.

Additional Service Items

- Master gauge

Initial Check

Verify the unused unloader port, if applicable, on the air compressor has a pipe plug installed.



Remove and inspect the air governor signal line from the air compressor for kinks, cuts, nicks, or plugging inside the line.

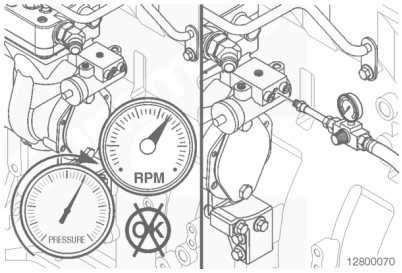
GRAPHIC NOT FOUND

Install pipe plugs in the air governor unloader ports.

Operate the engine to activate the air compressor.

If air pressure stops rising, there is a leak in an accessory or an accessory air line. See equipment manufacturer service information for troubleshooting and repair.

If the air compressor does **not** stop pumping (air pressure continues to rise) at the governed air pressure, connect a regulated shop air pressure line to the air compressor unloader valve port.



Note : Be sure the air pressure gauge is accurate and the supply lines and fittings are in good condition

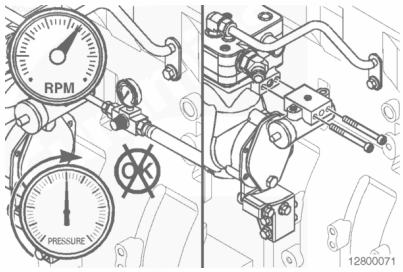
GRAPHIC NOT FOUND

before performing any air pressure checks.

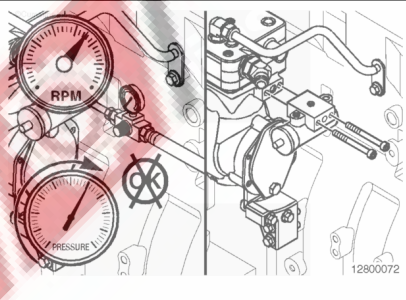
Check the air pressure gauge. Use a master gauge of known accuracy.

Apply 690 kPa [100 psi] air pressure to the unloader port.

If the air compressor stops pumping (air pressure stops rising), the air governor is malfunctioning and **must** be repaired or replaced. See equipment manufacturer instructions.



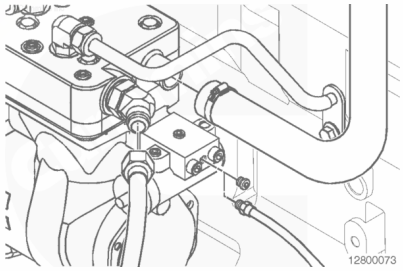
If the air compressor continues to pump (air pressure continues to rise), the unloader valve is malfunctioning and **must** be replaced. Refer to Procedure 012-013 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-013.html)



Remove the pipe plugs from the unloader ports used for accessory air lines.

Install and tighten the accessory air lines.

Connect the line to the unloader valve.



Operate the engine. Check for air leaks.

GRAPHIC NOT FOUND

ANADOLU ISUZU AFTER SALES

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

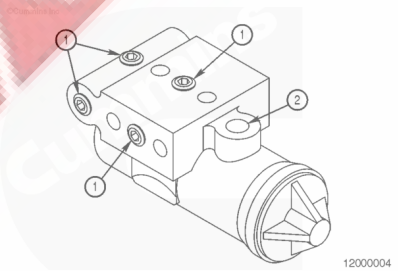
Additional Service Items

- No additional service items required.

Initial Check

Verify the unused unloader port, if applicable, on the air compressor has a pipe plug installed.

Verify all unused ports are plugged with pipe plugs except for the exhaust port on the air governor. The air governor exhaust port **must always** be ventilated to the atmosphere.

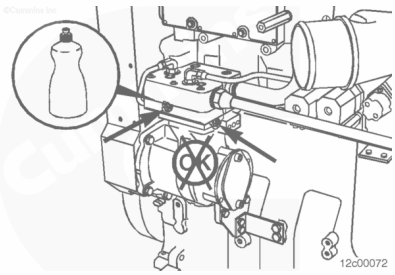


12000004

Operate the engine to activate the air compressor.

With the air compressor pumping between 550 to 690 kPa [80 to 100 psi], use a solution of soapy water to check for air leaks in the following areas:

- Air compressor head gasket
- Air compressor cover gasket
- Fittings and hoses connected to the intake, discharge, and air governor signal line on the air compressor
- Fittings and hoses connected at the air governor, wet tank, and air dryer.



12c00072

If air leaks are found at the air compressor head or cover gasket, verify the air compressor head and cover bolts are tightened properly. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html)

Shut the engine OFF. Check for air leaks both at keyswitch OFF and keyswith ON.

Note : Some components at keyswitch ON can make the sound of an air leak.

Walk around the vehicle. Listen for air leaks from the rest of the air system **not** already inspected.

Last Modified: 05-Aug-2016

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Oil carryover test tool, Part Number 4918883 (No longer available)

Additional Service Items

- High temperature flexible hose
- Sealable plastic bag

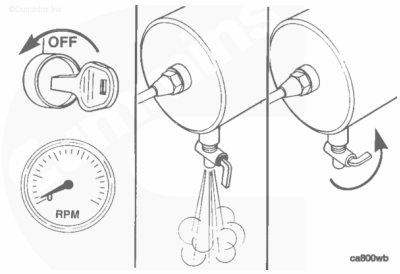
Inspect for Reuse

Perform this test in conjunction with troubleshooting the air compressor pumping oil into the air system.

Note : Small oil deposits at the air dryer purge valve are normal. The air compressor is lubricated with engine oil, and small amounts of carryover are to be expected. Oil carryover is more common on naturally aspirated air compressors. Oil carryover is usually caused by high inlet restriction to the air compressor. If oil carry over is suspected or found, check the engine air filter and air supply plumbing. See original equipment manufacturer (OEM) service information.

⚠ WARNING ⚠

The air discharge line and other equipment will become hot during the course of the test. To prevent burns, use protective gloves when touching heated surfaces.



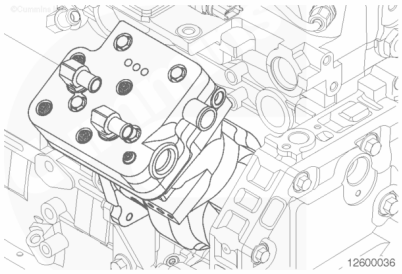
Operate the engine until the coolant temperature reaches normal operating temperature. Once the coolant has reached operating temperature, shut the engine down and completely drain the vehicle air system.

Note : Failure to warm the engine adequately can result in false test results.

⚠ WARNING ⚠

The discharge from the air compressor delivery will be hot, possibly contain oil vapors, and will be noisy. Be sure that there is adequate ventilation and that hearing

protection is used, particularly if the type of vehicle requires that the test be conducted in an enclosed environment.

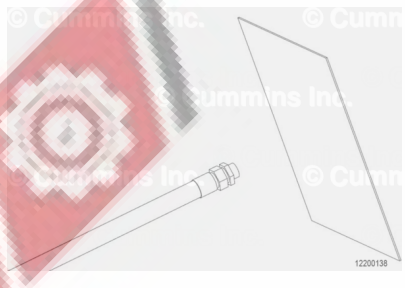


Isolate the air compressor from the rest of the system as follows:

Disconnect the discharge pipe from the air compressor cylinder head.

Disconnect the air inlet plumbing at the air compressor cylinder head.

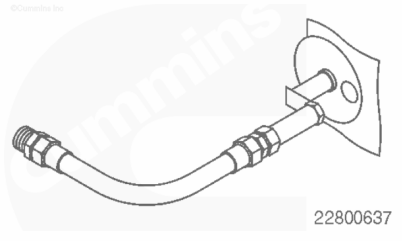
Connect the oil carryover test tool, Part Number 4918883, piping to the air compressor cylinder head discharge port. Do **not** connect the test tool at this stage. This tool has been discontinued and is no longer available for purchase. If you do not have the oil carryover test tool, Part Number 4918883, remove the air compressor discharge line from the air dryer, position the test paper at a distance of 75 mm (3.0 in, **not** to exceed 100 mm [3.9 in] from the end of the OEM compressor discharge line or flexible hose if fitted.



Make sure to have a 90 degree bend or a loop in the flexible hose during testing to create back-pressure.

Note : If the application presents restricted access to the air compressor, a high temperature flexible hose (minimum 15 mm [0.6 in] inside diameter) can be connected directly to the discharge port of the compressor in order to carry out the test outside the engine compartment. Be sure to have a 90 degree bend near the end of the flexible hose during testing.

Start the engine. Operate at high idle for 15 minutes to stabilize temperature and remove standing oil in the air compressor head. The air compressor should be pumping while the engine is running.



After 15 minutes and engine operating temperature is reached (this can be done by using a recommended Cummins® electronic service tool or equivalent to make sure the coolant temperature is above 85°C [185°F]; if the temperature is **not** reached within 15 minutes, continue to operate the engine until temperature is reached, shut down the engine.

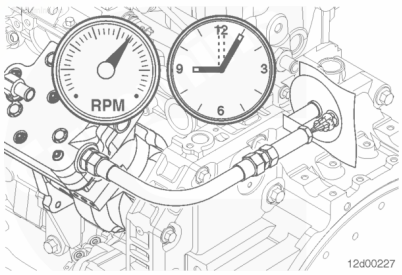
Connect the test tool. Install the test paper into the service tool, Part Number 4918883, if available. Make sure it is held at a right angle to and in line with the flow of compressed air, at a distance **not** to exceed 100 mm [3.9 in] from the end of the compressor discharge pipe or flexible hose, if fitted.

The test paper can be standard clean copier paper, typically 80 grams/sq meter. It **must** be mounted in the air compressor discharge line tool, leaving a 70 mm [2.76 in] diameter circle of the paper exposed. The outline of the circle in the mask **must** be drawn onto the test paper to later aid in comparison.

Note : It can be necessary to use a recommended Cummins® electronic service tool or equivalent to increase the maximum engine speed, without vehicle speed sensor (VSS), to 2100 rpm.

19r00163

To perform the test, start the engine and run at high idle (between 2000 and 2500 rpm). Leave the test paper in the air flow for exactly 5 minutes. Rotate the tool mask exposing a new circular test area.



12d00227

Repeat this test three times, using a new circular test area/paper each time.

Shut the engine OFF. Remove the test paper.

Note : If the maximum engine speed, without VSS, was adjusted in the previous step, change it back to the original value upon completion of the test.

Note : The three test samples should be comparable (similar in size). If **not**, run the test again.

Note : To make sure **only** oil is observed and **not** moisture, look at the back-side of the test paper. Moisture will have a yellow tint, and oil will be black. Compare the test results with the reference results shown below.

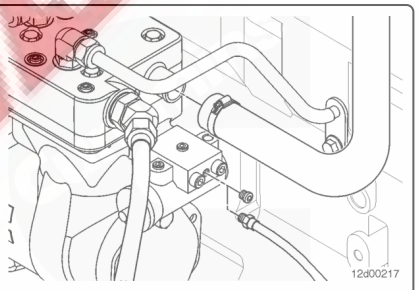
⚠ WARNING ⚠

Air pressure must be released from the system before removing the air governor. The governor can be under pressure and cause personal injury.

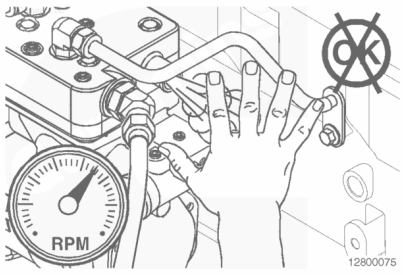


Remove the air governor or air governor line from the air compressor.

Remove the air intake line from the air compressor cylinder head.

⚠ CAUTION ⚠

Do not hold a hand too close to the intake port of the air compressor.



Operate the engine to activate the air compressor.

Hold a hand 5 cm [2 in] from the air compressor intake port. If air is coming out of the intake port, the pressure relief valve is malfunctioning and the air compressor cylinder head **must** be replaced. Refer to Procedure 012-007 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-007.html) Refer to Procedure 012-008 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-008.html)

ANADOLU ISUZU
OTHER SALES

If no air is felt from the intake port, check downstream air system components for damage or restrictions. Verify the intake and exhaust valves are functioning properly. Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)

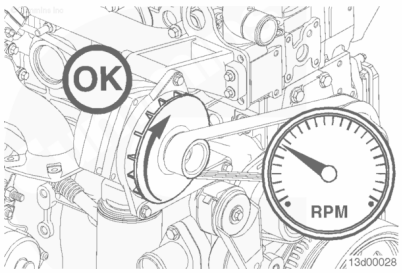
General Information

Due to the number of different alternator brands and configurations, the following procedure has been generalized to cover the most common configurations. Consult the alternator manufacturer for any information **not** covered in this procedure.

Initial Check

Check the drive belt and alternator pulley to make sure the alternator is rotating properly.



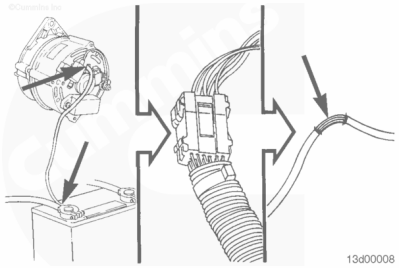
If any problems exist, check the following:

- If the drive belt is slipping on the alternator pulley, inspect the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Inspect the belt tensioner. Refer to Procedure 008-080 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-080-tr.html)
- Check if the alternator pulley is loose on the shaft. If loose, remove the pulley and inspect for damage. See alternator manufacturer and/or the equipment manufacturer service information.
- If the alternator will **not** rotate or does **not** rotate freely, the alternator **must** be replaced. See the Remove and Install sections of this procedure.

ANADOLU ISUZU DEALER SALES

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

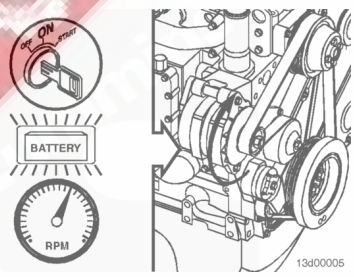


Check the battery and all wiring connections.

Inspect the wiring for defects.

Check all connections for tightness and cleanliness, including the slip connectors at the alternator and engine compartment bulkhead, and connections at the battery.

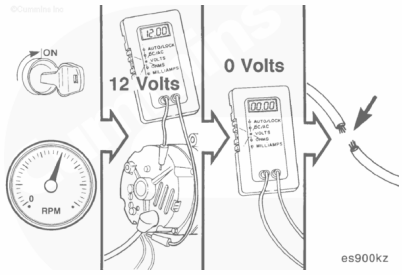
Check the drive belt and alternator pulley to be sure the alternator is rotating.



Test

Note : This test applies to Delco™ alternators.

Note : Any multimeter reading of zero voltage indicates an open circuit.



Check for open circuits.

Turn the keyswitch to the ON position.

Connect multimeter, Part Number 3164488 or 3164489, or equivalent, to the following locations:

Delco™ Alternators

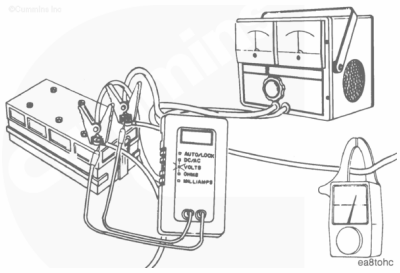
- Alternator "BAT" terminal to ground
- Alternator blade terminal "Number 1" to ground
- Alternator blade terminal "Number 2" to ground.

Locate and repair the open circuit.

ANADOLU ISUZU PARTS SALES

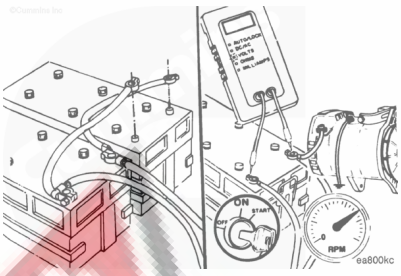
Connect a carbon-pile load (battery/alternator tester) across the battery posts of the battery boxes.

Clamp an induction pickup-type ampere-hour meter around the battery cable; or use digital multimeter, Part Number 3164488 or 3164489, or equivalent, with clamp-on current probe, Part Number 3164490, or equivalent.



⚠ WARNING ⚠

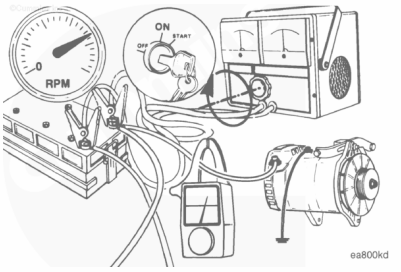
Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.



Disconnect any cables that lead to any other battery boxes in the circuit, negative (-) cables first.

Operate the engine at high idle. Measure the alternator voltage output to the batteries with digital multimeter, Part Number 3164488 or 3164489, or equivalent. See equipment manufacturer service information.

Operate the engine at high idle. Adjust the carbon-pile load-testing equipment to apply the maximum rated amperage load to the alternator. See equipment manufacturer service information.



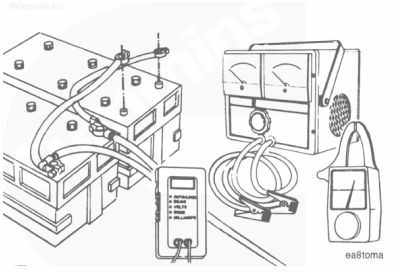
Note : The alternator maximum rated amperage output is normally stamped or labeled on the alternator.

Measure the alternator amperage output. See equipment manufacturer service information.

If the alternator output (amps) is **not** within 10 percent of rated output, repair or replace the alternator. See equipment manufacturer service information for repair procedures.

Shut off the engine. Remove the test equipment.

Connect all battery cables, negative (-) cable last.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Disconnect the batteries. See equipment manufacturer service information.
- Disconnect the battery ground cable.
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Tag and label wires attached to the alternator.
- Remove the wires attached to the alternator.

Side Mounted Bracket

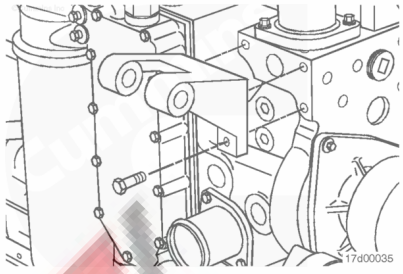
Install the side-mounted bracket and bracket mounting capscrews.

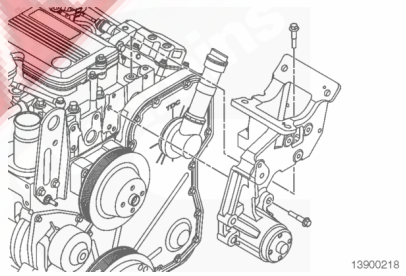
Torque Value: 24 n•m [212 in-lb]



Front Mounted Bracket

In a diagonal pattern, install the front-mounted bracket and the bracket mounting capscrews.

Torque Value: 65 n•m [48 ft-lb]



Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Install the alternator. Refer to Procedure 013-001 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-001-tr.html)
- Install the drive belt. Refer to Procedure 008-002 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-002-tr.html)
- Connect the batteries. See equipment manufacturer service information.

ANADOLU ISUZU AFTER SALES

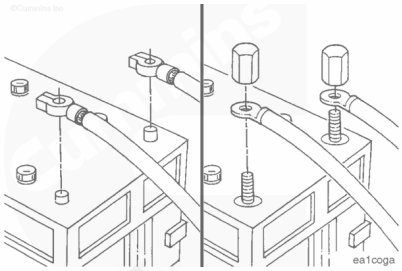
- Start the engine. Check for proper operation.

Last Modified: 12-Jun-2018

General Information

⚠ WARNING ⚠

Batteries can emit explosive gas. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the battery (-) negative cable first and attach the battery negative cable last.



There are many types of batteries with varying technology. Common battery types include:

- Standard lead acid (also called flooded or wet cell)
  - Starting
  - Deep cycle
  - Serviceable or maintenance free
- Maintenance free absorbent glass mat (AGM)
- Maintenance free gel cell

Check Original Equipment Manufacturer (OEM) or battery supplier service literature for battery removal and installation, maintenance, inspection, and testing requirements.

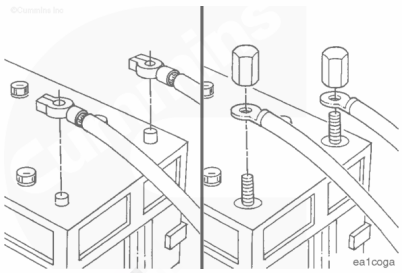
ANADOLU ISUZU
AFTER SALES

Last Modified: 25-Aug-2015

Initial Check

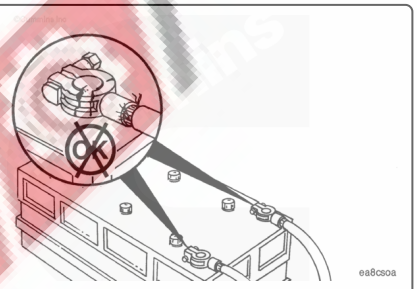
There are two possible heavy-duty battery connections:

- Battery terminal and clamp (1)
- Threaded battery terminal and nut (2).



⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

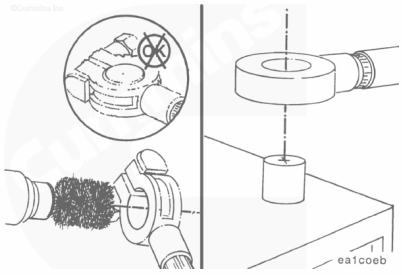


Remove and inspect the battery cables and connections for cracks or corrosion.

Replace broken terminals, connectors, or cables.

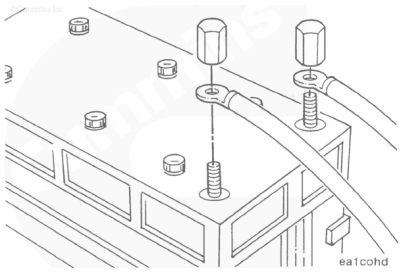
If the connections are corroded, use a battery brush or wire brush to clean the connections until shiny.

Make sure all debris is removed from the connecting surfaces.



⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.



Install the cables and tighten the battery connections.

Coat the terminals with grease to prevent corrosion.

ANADOLU ISUZU AFTER SALES

Last Modified: 26-Aug-2003

Select Service Tools

Recommended Cummins® Service Tools

- Digital multimeter, Part Number 3164488

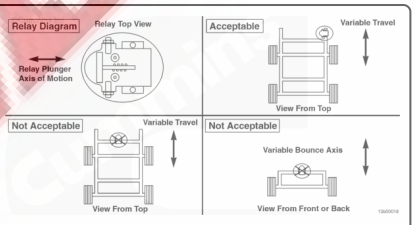
Additional Service Items

- No additional service items required.

Initial Check

⚠ CAUTION ⚠

Improper installation of the starter magnetic switch can result in starter over-run damage.



To make sure the magnetic switch is **not** activated by vehicle movement, the axis of the plunger **must** be horizontal to the ground and perpendicular to vehicle travel.

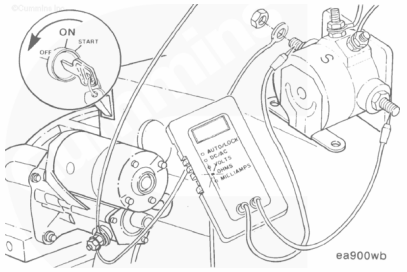
Do **not** mount an external magnetic switch on the engine or on any metal that can possibly resonate as the result of road or engine vibration.

- See equipment manufacturer service information manual for proper magnetic switch installation.

Resistance Check

Remove the cable connecting the magnetic switch to the starting motor solenoid from the magnetic switch terminal.

Set digital multimeter, Part Number 3164488, to measure resistance (ohms).

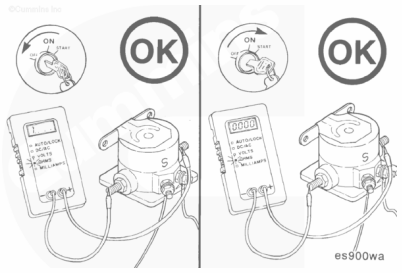


Connect the leads to the two large switch terminals.

With the starting motor switch in the OFF position, the multimeter **must** indicate resistance greater than 100k ohms.

Turn the starting motor switch to the START position.

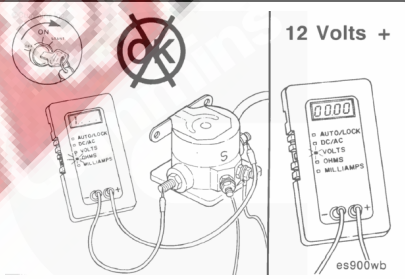
The multimeter **must** indicate less than 10 ohms. If **not** within specifications, replace the starter magnetic switch according to manufacturer instructions.



Voltage Check

If the multimeter indicates resistance at greater than 100k ohms with the starting motor switch in the "START" position, turn the starting motor switch to the "OFF" position.

Set the multimeter scale to read DC voltage.



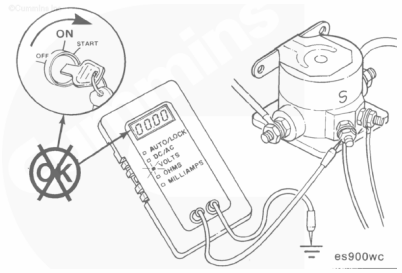
Connect one multimeter lead to the magnetic switch terminal marked "S" and the other lead to ground.

Turn the starting motor switch to the "START" position.

If the multimeter indicates no voltage, the magnetic switch is **not** the cause of the complaint. Refer to Procedure 013-018 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-018.html)

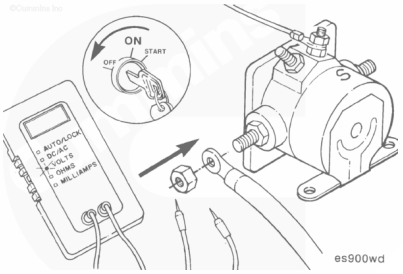
If the starter magnetic switch is **not** within specification, replace the switch according to manufacturer instructions.

Note : For Cummins® branded Delco-Remy™ starters, a service kit is avaialble to replace **only** the magnetic switch as opposed to the whole starter assembly.



Turn the starting motor switch to the "OFF" position.

Remove the multimeter leads. Connect the magnetic switch to the starting motor solenoid wire.



ANADOLU ISUZU PARTS SALES

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- Digital multimeter, Part Number 3164488, or equivalent

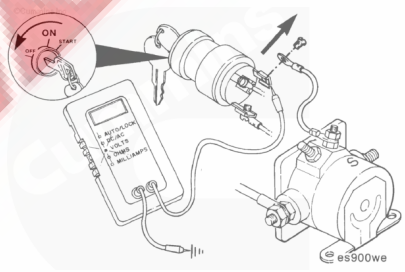
Additional Service Items

- No additional service items required.

Voltage Check

⚠ WARNING ⚠

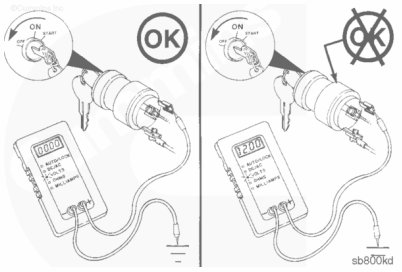
Be sure the starter motor switch is in the “OFF” position to prevent electrical shock and personal injury.



Remove the wire connecting the starting motor switch to the magnetic switch (marked “S” or “START”) from the starter switch terminal.

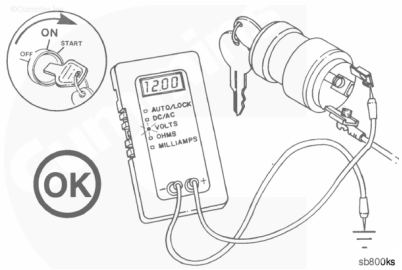
Connect the positive (+) lead of digital multimeter, Part Number 3164488, or equivalent, to the starter switch terminal and the negative (-) lead to a chassis or engine ground location.

Note : Set the multimeter to indicate DC volts with the starting motor switch in the "OFF" position. There must **not** be voltage at the starter switch terminal. If the meter indicates voltage, the starter switch is malfunctioning and **must** be replaced.



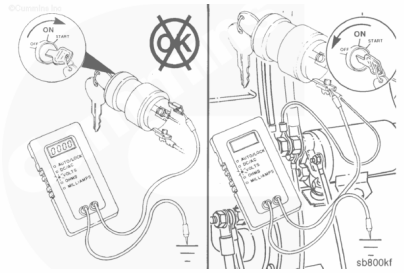
Turn the starting motor switch to the “START” position.

The multimeter **must** indicate system voltage.



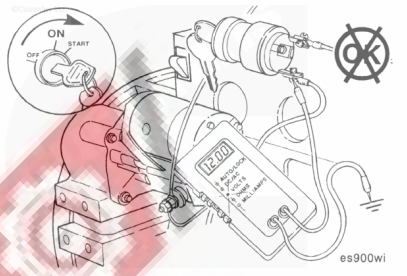
If there is no voltage, turn the starting motor switch to the “OFF” position.

Connect the multimeter positive (+) lead to the starter switch terminal having a wire connecting the starter switch to the starting motor solenoid B terminal.



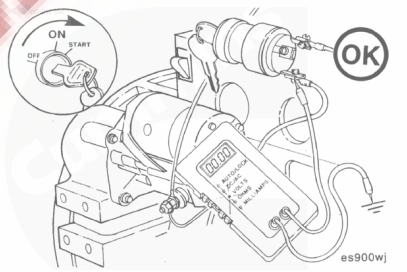
Turn the starting motor switch to the “START” position.

If the meter indicates system voltage at the starter switch input terminal, the starter switch is malfunctioning and **must** be replaced. See equipment manufacturer service information for the replacement procedure.



If the meter indicates no voltage, the switch is **not** the cause of the complaint.

Check the wiring from the starter switch to the starting motor solenoid B terminal and from the starting motor solenoid to the battery for broken or damaged wires.



ANADOLU ISUZU
AFTER SALES

Last Modified: 01-Nov-2016

Select Service Tools

Recommended Cummins® Service Tools

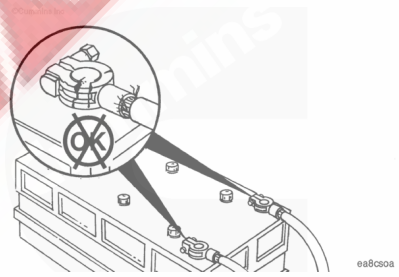
- Digital multimeter, Part Number 3164488, or equivalent

Additional Service Items

- No additional service items required.

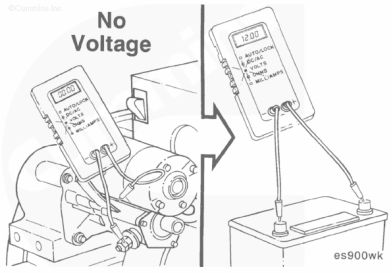
Initial Check

Before troubleshooting the starting motor, make sure the battery terminals are **not** loose or corroded. Refer to Procedure 013-009 in Section 13. (/qs3/pubsys2/xml/en/procedures/99/99-013-009.html)



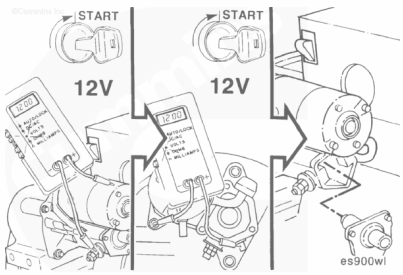
Use digital multimeter, Part Number 3164488, or equivalent, to set the voltage scale.

Check for system voltage at the starting motor solenoid battery terminal.



If the multimeter indicates system voltage at the starting motor battery terminal, check the voltage at the starting motor solenoid S terminal, when the starting switch is energized.

If the multimeter indicates system voltage at the S terminal, but the starter does **not** engage, the starting motor solenoid is malfunctioning and the starter **must** be replaced. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)



ANADOLU ISUZU
AFTER SALES

If the multimeter does **not** indicate system voltage at the S terminal, check:

GRAPHIC NOT FOUND

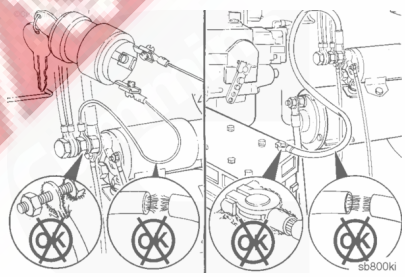
- Fuses
- Voltage to the ignition switch and magnetic switch. Refer to Procedure 013-018 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-018.html) Refer to Procedure 013-017 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-017.html)
- Application safety shutoff systems.

Voltage Check

Set digital multimeter, Part Number 3164488, to measure DC voltage.

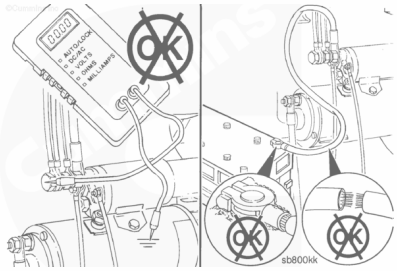
Connect the multimeter positive (+) lead to the starter solenoid positive cable terminal and the negative (-) lead to a chassis or engine ground location.

The multimeter **must** show a voltage with the starter switch “OFF” to be normal.



If the multimeter does **not** indicate a voltage, check the cable connecting the starter solenoid and battery for breaks.

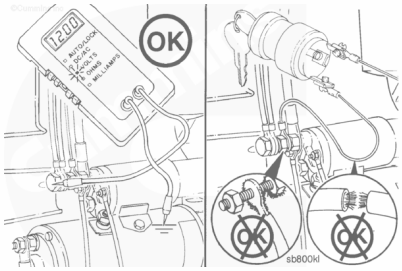
Also check for loose or corroded connections.



If the multimeter indicates a voltage, but the starter will **not** operate, check the wire connecting the starter solenoid to the starter switch for breaks.

Also check for loose or corroded connections.

Make sure to check for:

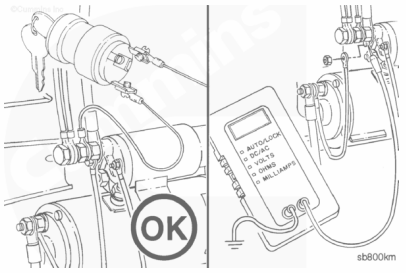


- Fuses
- Application engine shutoff systems.

ANADOLU ISUZU PARTS SALES

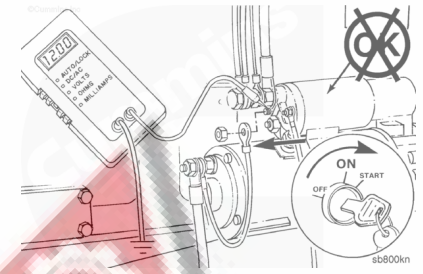
If the wire connecting the starter solenoid and starter switch is **not** loose or damaged, and the starter will **not** operate, remove the cable connecting the starter and starter solenoid from the solenoid terminal.

Connect the multimeter positive (+) lead to the solenoid positive (+) terminal and the negative (-) lead to the chassis or an engine ground location.

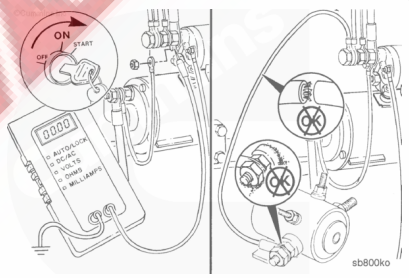


Turn the starter switch to the ”START” position.

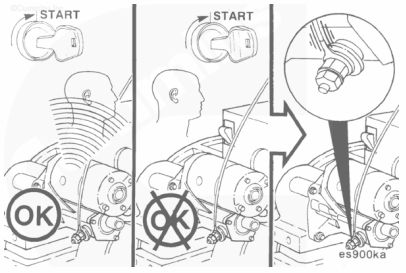
If the multimeter indicates a voltage, the starter solenoid is malfunctioning and **must** be replaced. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)



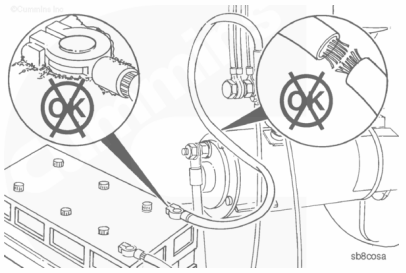
If the multimeter does **not** indicate a voltage, check the wire connecting the starter solenoid to the magnetic switch for breaks, and for loose or corroded connections.



If the wire connecting the starter solenoid to the magnetic switch is **not** loose or damaged and the starter will **not** operate, check the cable connecting the starter solenoid to the starting motor for breaks, and for loose or corroded connections.



Check the cable connecting the starting motor to the battery for breaks, and for loose or corroded connections.



If the cables are **not** loose or damaged, the starting motor is malfunctioning and **must** be replaced. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)

GRAPHIC NOT FOUND

ANADOLU ISUZU PARTS

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

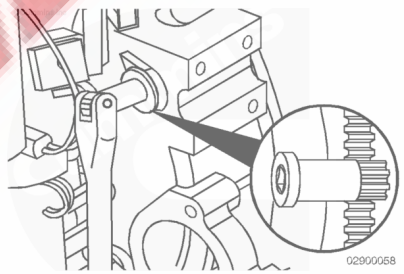
- Barring tool, Part Number 5299073
- Sealant, Part Number 3164067, or equivalent

Additional Service Items

- Depth micrometer or vernier caliper

Rotation Check

If the starting motor solenoid is making a sound but the engine is **not** rotating, turn the keyswitch to the OFF position, and attempt to bar the crankshaft in both directions.

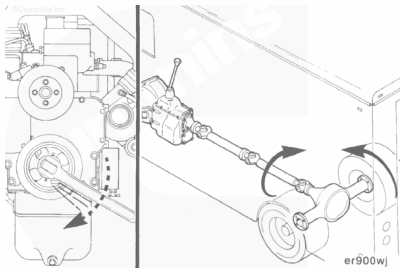


Bar the engine with the barring tool, Part Number 5299073.

If the crankshaft will bar over, attempt to start the engine. If the starting motor cranks the engine, check the starting motor pinion gear and flywheel ring gear for damage.

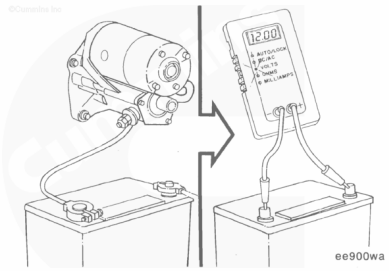
If damage to the starting motor pinion gear and/or flywheel ring gear is found when replacing the components, make sure to measure the distance from the starting motor mounting flange to the forward face of the front side of the flywheel ring gear. Follow the Measure step of this procedure.

If the crankshaft does **not** rotate or requires more than the normal effort to bar, check for an internal malfunction or a problem with the drive unit and/or accessories.



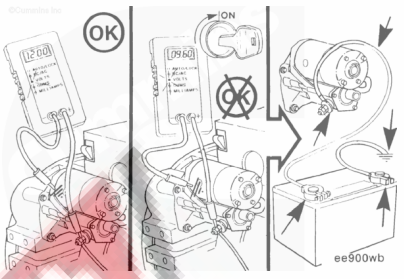
If the engine cranking speed is too slow or will **not** crank at all, and the engine rotates freely:

- Make sure the wiring connections are clean, tight, and **not** damaged.
- Check the battery voltage. See equipment manufacturer service information.



Check the voltage at the starting motor during cranking. If the voltage drops more than 2.4 VDC on a 12 volt system, or 4.8 VDC on a 24 volt system, check that all connections are clean and tight.

If the cables are correct and the voltage drop exceeds the limit, replace the starting motor.



Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

- Disconnect the batteries. See equipment manufacturer service information.
- Identify each wire with a tag indicating its location on the starting motor.
- Remove the electrical connections from the starting motor.
- Prior to removing the starter, use steam to clean the area around the starting motor, to prevent debris from entering the flywheel housing.
- Dry with compressed air.

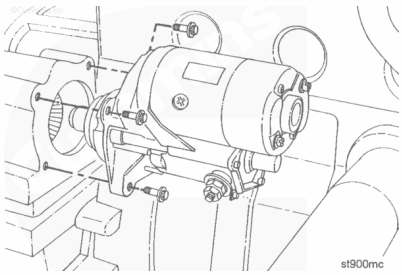
Remove

Identify each wire with a tag indicating itslocation on the starting motor.

Remove the electrical connections from the starting motor.

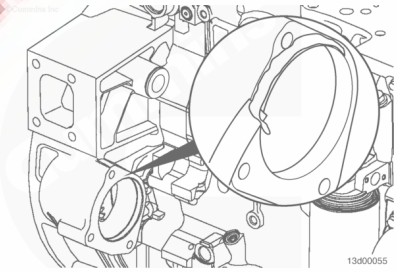
Remove the three capscrews and starting motor.

If equipped with a starting motor spacer, remove the spacer. Clean all surfaces between the starting motor, starting motor spacer, and flywheel housing. Use a wire brush.



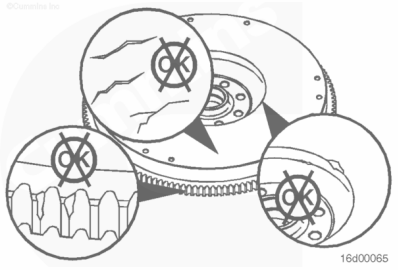
Clean and Inspect for Reuse

For engines that use wet flywheel housing, clean any left over sealant from the starting motor mounting flange on both the flywheel housing and starting motor. Make sure these surfaces are clean of oil and debris.



Inspect the starting motor pinion gear and/or flywheel/flexplate ring gear for chipping or uneven wear.

If the start motor pinion gear and/or flywheel ring gear teeth are damaged, they **must** be replaced, if equipped, with a flexplate. Refer to Procedure 016-008 in Section 16. (/qs3/pubsys2/xml/en/procedures/425/425-016-008.html)



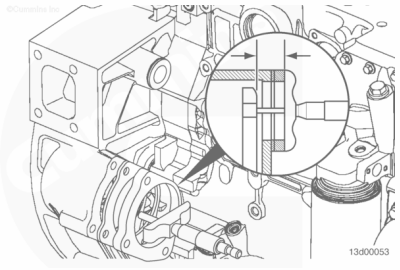
Measure

Use a depth micrometer or vernier caliper to measure the distance from the starting motor mounting flange to the forward face of the front side of the flywheel ring gear.

Note : Include any spacers previously removed when completing the measurement.

ANADOLU ISUZU
USED PARTS SALES

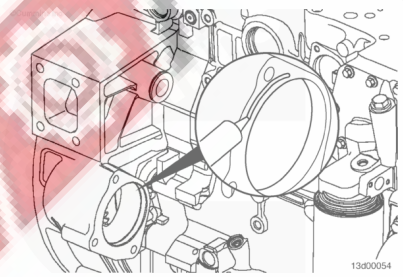
Starting Motor Spacing		
mm		in
49.28	MIN	1.94
52.32	MAX	2.06



Add or remove spacers as necessary to achieve the correct starting motor spacing.

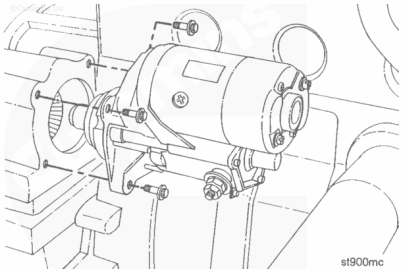
Install

Note : If a starting motor spacer is required, make sure to apply sealant to the side of the spacer that contacts the starting motor.



For engines with wet flywheel housings, apply a 1.5 to 2.0 mm [0.06 to 0.09 in] wide bead of sealant, Part Number 3164067, or equivalent, to the flywheel housing starting motor mounting flange.

Install the three capscrews, starting motor, and starting motor spacer, if required.

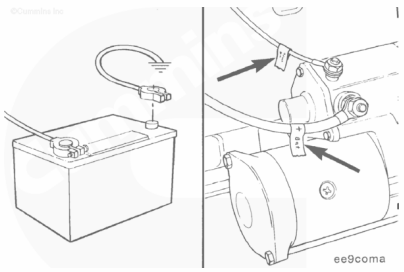


Torque Value: 43 n•m [32 ft-lb]

Cummins® Branded Starters

⚠ CAUTION ⚠

Do not overtighten the electrical connections. Starting motor damage can result.



Note : Use the location tags to help identify where each wire connection goes.

Connect the electrical connections to the starting motor.

Torque Value:
M5 4 n•m [35 in-lb]

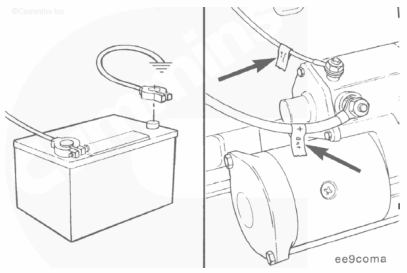
Torque Value:
M10 21 n•m [186 in-lb]

ANADOLU ISUZU AFTER SALES

Non-Cummins® Branded Starters

⚠ CAUTION ⚠

Do not overtighten the electrical connections. Starting motor damage can result.



Note : Use the location tags to help identify where each wire connection goes.

Connect the electrical connections to the starting motor.

For Non-Cummins® branded starters, see equipment manufacturer service information for torque specifications.

Finishing Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- Connect the batteries. See equipment manufacturer service information.
- Operate the starter. Check for proper operation.

Select Service Tools

Recommended Cummins® Service Tools

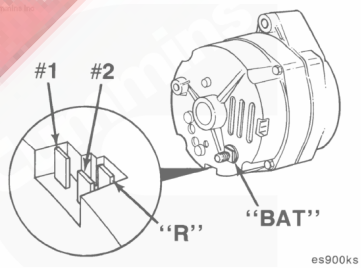
- No Cummins® Service Tools required.

Additional Service Items

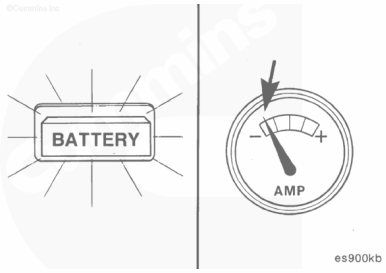
- No additional service items required.

Initial Check

Make sure the correct terminals are being used on the alternator. The R terminal (Delco™) or W terminal (Bosch™ K1) provide half of the system voltage and is used to operate accessories such as the tachometer on generator sets.

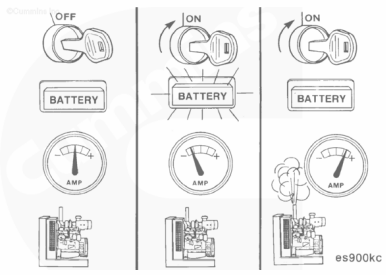


Trouble with the starting system can be indicated by the indicator lamp or ampmeter.



Check the indicator lamp for normal operation as shown below:

Engine	Switch	Lamp	Ampmeter
Stopped	OFF	OFF	0
Stopped	ON	ON	-
Running	ON	OFF	+



If the lamp is on when the switch is OFF and the engine is **not** running, disconnect the lamp lead at the ignition switch.

- If the lamp stays on, there is a short to a positive wire.

ANADOLU ISUZU AFTER SALES

- If the lamp goes out, there is a short in the switch.

If the lamp goes off when the switch is ON and the engine is **not** running, there can be an open in the circuit.

Check for a blown fuse, a burned out bulb, defective bulb socket, or an open in the Number 1 or D (+) lead circuit between alternator and ignition switch.

If the lamp is on when the switch is ON and the engine is running, disconnect the lead to the alternator.

- If the lamp stays on, there is a short to the ground in the lamp circuit.
- If the lamp goes out, inspect the alternator.

Select Service Tools

Recommended Cummins® Service Tools

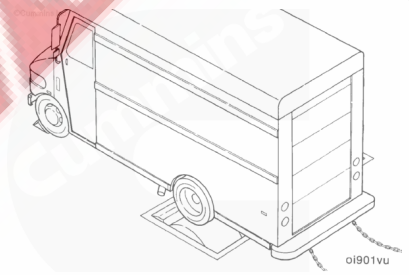
- No Cummins® Service Tools required.

Additional Service Items

- No additional service items required.

Setup

The performance of an engine installed in on-highway vehicles can be tested on a chassis dynamometer.



Note : Because of live driveline efficiency and engine-driven accessories, the engine horsepower when measured at the rear wheels will be reduced by approximately:

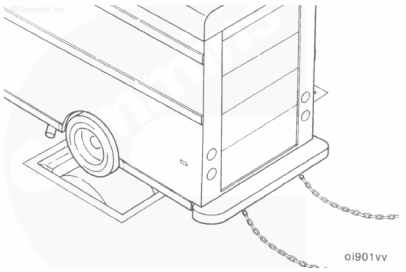
- 20 percent for single-axle vehicles
- 25 percent for tandem-axle vehicles
- 30 percent for tri-axles vehicles
- 35 percent for recreational vehicles.

These specifications apply to drive axles **only**, **not** tag axles.

Note : These percentages are used for engine run-in **only** and are **not** to be used as absolute figures.

⚠ WARNING ⚠

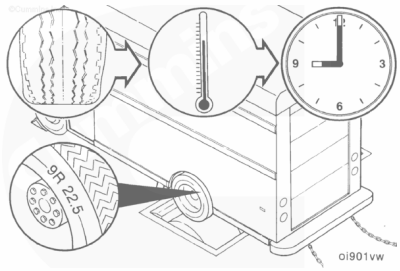
Follow all the OEM's safety precautions before installing or operating a vehicle on a chassis dynamometer. Failure to do so can cause damage to the vehicle and/or cause personal injury.



⚠ CAUTION ⚠

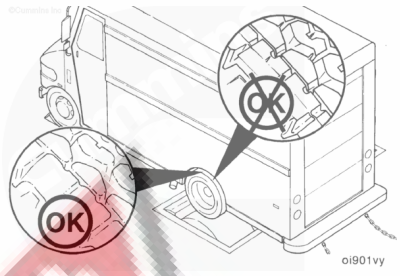
Low-profile tires are more sensitive to heat than bias ply tires. Excessive operating time at full load can damage the tires due to overheating. Check tire

manufacturer recommendations for the maximum allowable chassis dynamometer operating time.

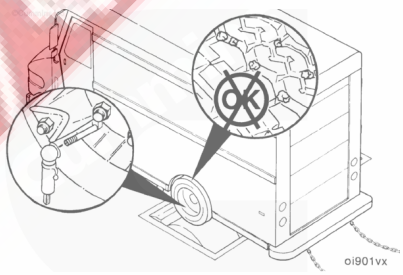


While operating the chassis dynamometer, follow the general safety precautions listed below:

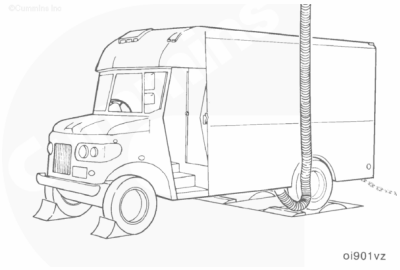
- Use tires that have more than 160 km [100 mi] of use. Do **not** use new tires.
- Do **not** use recapped tires or tires of different sizes or designs.



- Make sure the tires are inflated to manufacturer specifications.
- Remove all rocks or other materials from the treads of the tires rotating on the dynamometer rollers.

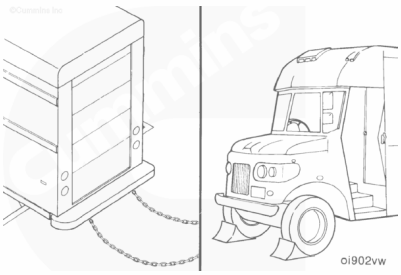


- Make sure there is correct overhead clearance for exhaust stacks, air deflectors, or other attachments above the cab.



⚠ CAUTION ⚠

To prevent damage to the chassis dynamometer, make sure there is enough slack in the tie-down chains.



Carefully position the vehicle on the rollers.

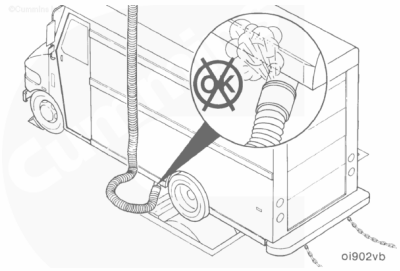
Attach the tie-down chains to the rear of the vehicle.

Place wheel chocks in front of the front tires.

⚠ WARNING ⚠

ANADOLU ISUZU AFTER SALES

Some exhaust gas constituents may be toxic and/or carcinogenic. Make sure the ventilation hose does not leak.



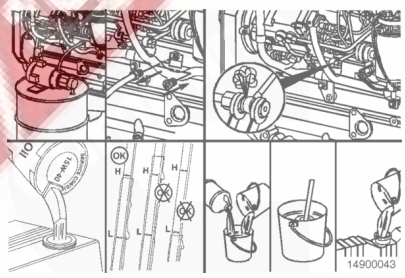
Adjust the vehicle and dynamometer room exhaust system to make sure all the exhaust gases are removed from the room.

Read chassis dynamometer and vehicle manufacturer recommendations and specifications for testing procedures.

Test

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.



The following procedure assumes the lubricating oil and fuel systems were correctly primed, the dipstick calibrated, and the engine filled to the correct levels with lubricating oil and coolant during installation of the engine into the chassis. If these systems were **not** serviced during installation of the engine.

Use the following procedures for instructions on priming the lubricating oil and fuel system and calibrating the dipstick.Refer to Procedure 014-006 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-006.html)

See the Operation and Maintenance Manual for instructions on filling the lubricating oil and the cooling systems.

The number of instruments and gauges required to perform a chassis dynamometer test will vary according to type and capability of the test equipment used.

See the service tools listed at the beginning of this section.

To correctly monitor engine performance, record the following parameters:

- Lubricating oil pressure (vehicle instrument panel)
- Engine speed (rpm) (vehicle instrument panel)
- Wheel horsepower (whp) (dynamometer controls)
- Blowby: Refer to Procedure 014-010 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-010.html)
- Exhaust back pressure: Refer to Procedure 011-009 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-011-009.html)
- Coolant temperature (vehicle instrument panel): Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Coolant pressure:. Refer to Procedure 008-018 in Section 8. (/qs3/pubsys2/xml/en/procedures/425/425-008-018-tr.html)
- Intake manifold pressure: Refer to Procedure 019-159 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-159.html)
- Inlet air restriction: Refer to Procedure 010-031 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-031.html)
- Fuel supply pressure: Refer to Procedure 006-051 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-051.html) Refer to Procedure 006-024 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-024.html)

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

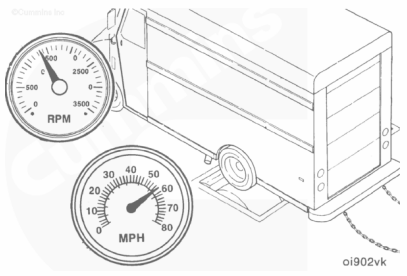
- No additional service items required.

General Information

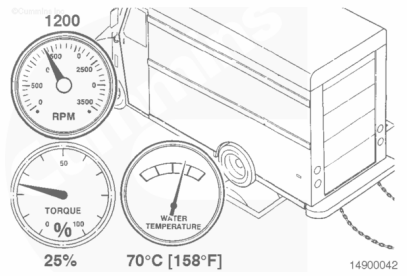
For general chassis dynamometer, operating/testing procedures and safety precautions. Refer to Procedure 014-002 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-002.html)

Test

Operate the vehicle in a gear that produces a road speed of 90 to 95 km/h [56 to 59 mph].

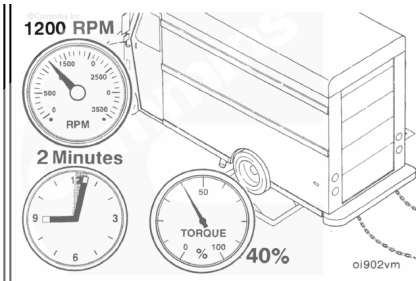


Operate the engine at 1200 rpm and 25 percent of torque peak load until the water temperature reaches 70°C [158°F].

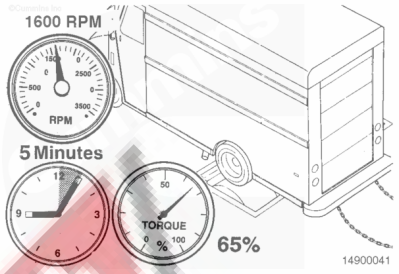


Operate the engine at 1200 rpm and 40 percent of torque peak load for 2 minutes. Check the gauges. Record the readings.

ANADOLU ISUZU AFTER SALES

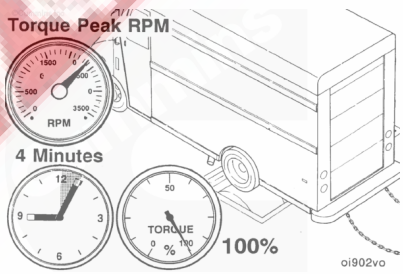


Operate the engine at 1600 rpm and 65 percent of torque peak load for 5 minutes. Check the gauges. Record the readings.



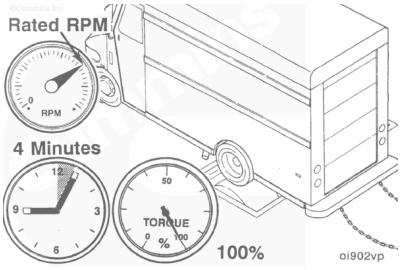
Operate the engine at torque peak rpm and full load for 4 minutes. Check the gauges. Record the readings.

Note : See the engine data sheet for the torque peak rpm of the engine model being tested.



⚠ CAUTION ⚠

Do not shut off the engine immediately after the run-in is completed. Allow the engine to cool by operating it at low idle for a minimum of 3 minutes to avoid engine component damage.



Operate the engine at rated speed (rpm) and full load for 4 minutes. Check the gauges. Record the readings. Compare the readings to those published on the appropriate engine data sheet.

Make sure all instrumentation is removed before removing the vehicle from the dynamometer.

OFFER

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

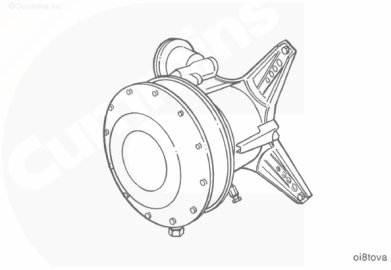
- Engine lifting fixture, Part Number 3162871
- Vacuum gauge, Part Number ST 434
- Water manometer, Part Number ST 1111 3
- Pressure gauge, Part Number ST 1273

Additional Service Items

- No additional service items required.

Setup

Note : Make sure the dynamometer capacity is sufficient to permit testing at 100 percent of engine rated horsepower. If the capacity is **not** enough, the testing procedure **must** be modified to the restrictions of the dynamometer.

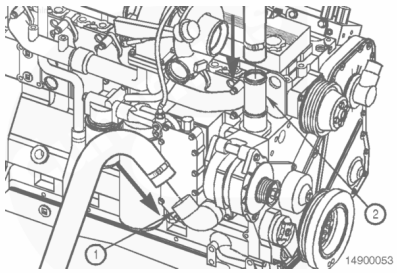


Use engine lifting fixture, Part Number 3162871, to install the engine to the test stand. Align and connect the dynamometer. See manufacturer instructions for aligning and testing the engine.

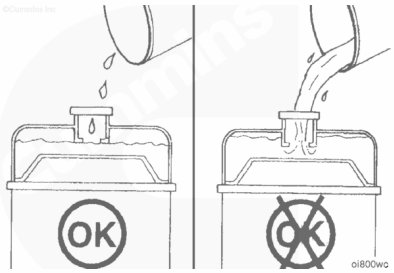
Connect the coolant supply to the water inlet connection (1).

Connect the coolant return to the water outlet connection (2).

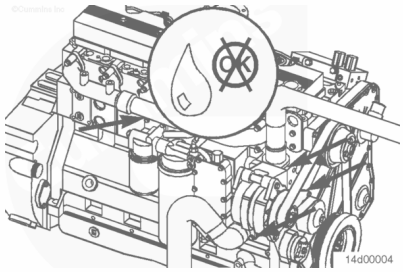
Install the drain plugs, close all the water drain cocks, and make sure all of the clamps and fittings are tight.



Fill the cooling system with coolant to the bottom of the fill neck in the radiator fill (or expansion) tank.



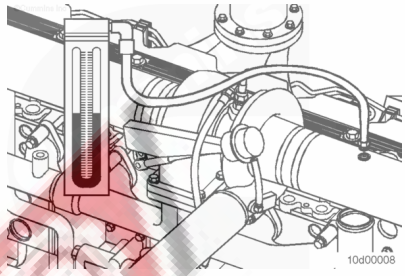
Inspect the engine for coolant leaks at connections, fittings, plates, and plugs. Repair if necessary.



Air Inlet Restriction

Note : The manometer connection **must** be installed at a 90 degree angle to the airflow in a straight section of pipe, one pipe diameter before the turbocharger.

Note : A vacuum gauge, Part Number ST 434, can be used in place of the water manometer.



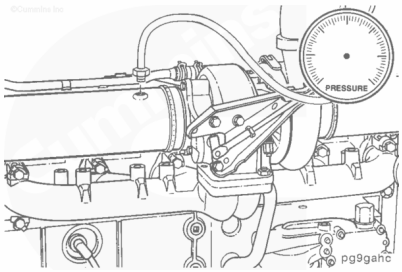
Connect water manometer, Part Number ST 1111 3, to the turbocharger air inlet pipe to test air restriction.

Measurements		
	mm-h2o	in-h2o
Minimum Gauge Capacity	760	30

Exhaust Restriction

Note : For automotive applications, a tapped hole is provided on the inlet side of the catalyst for checking exhaust restrictions.

Note : A pressure gauge, Part Number ST 1273, can be used in place of the mercury manometer.



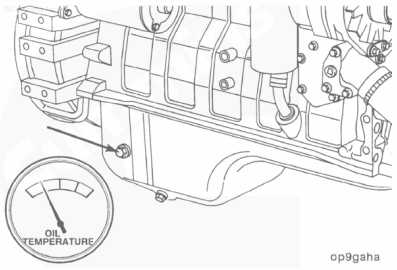
Connect a mercury manometer to a straight section of the exhaust piping near the turbocharger outlet to check exhaust restriction.

Measurements		
	mm-hg	in-hg
Minimum Gauge Capacity	254	10

Attach the lubricating oil temperature sensor in the location illustrated.

ANADOLU ISUZU PARTS

Measurements		
	celsius	fahrenheit
Minimum Gauge Capacity	150	300



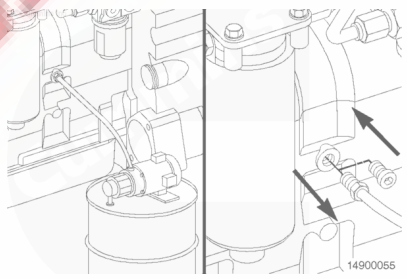
⚠ CAUTION ⚠

The lubricating oil system must be primed before operating the engine after if has been rebuilt to avoid internal damage.

GRAPHIC NOT FOUND

To prime the lubricating oil system using external pressure, connect the supply to a tapped hole in the main lubricating oil rifle.

Use a pump capable of supplying 210 kPa [30 psi] of continuous pressure. Connect the pump to the port on the main lubricating oil rifle as shown.

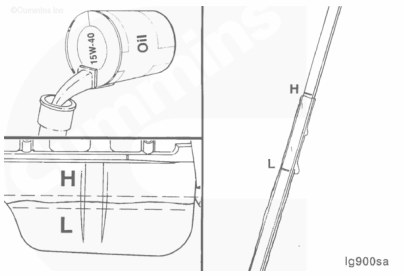


Use clean lubricating oil to prime the system until the oil pressure registers on the gauge.

Remove the lubricating oil supply tube. Install the plug.

Make sure the lubricating oil has had time to drain to the lubricating oil pan and fill the engine to the high mark, as measured on the dipstick.

Use the correct lubricating oil as specified in the equipment manufacturer service information.



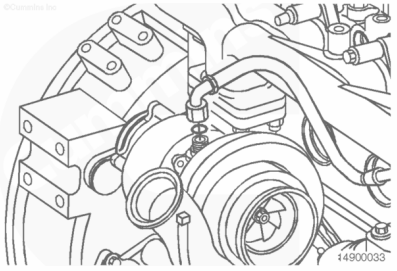
If an external pressure pump is **not** available, prime the lubricating system according to the following procedure.

Fill the engine with lubricating oil to the high-level mark on the dipstick.

Disconnect the turbocharger lubricating oil supply tube.

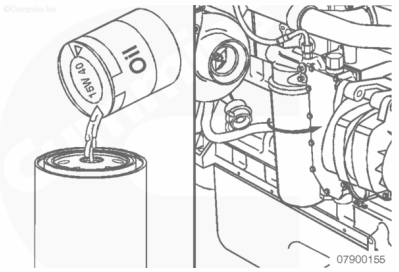
Pour 50 to 60 cc [2.0 to 3.0 fl oz] of clean engine lubricating oil into the turbocharger lubricating oil supply hole.

Connect the lubricating oil supply tube to the turbocharger.



⚠ CAUTION ⚠

Mechanical overtightening can distort the threads or damage the filter element seal.



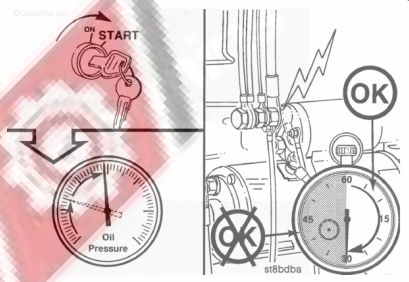
Fill the lubricating oil filter with clean engine lubricating oil.

Screw the filter onto the filter head fitting until the gasket contacts the filter head surface.

Tighten the filter as specified by the manufacturer.

⚠ CAUTION ⚠

Do not crank the starting motor for periods longer than 30 seconds. Excessive heat will damage the starting motor.



Crank the engine until the lubricating oil pressure gauge indicates system pressure.

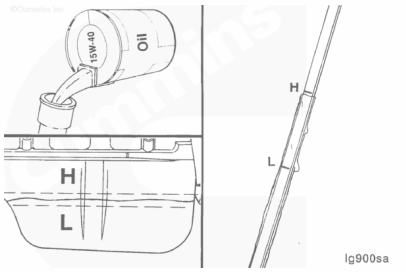
Note : Allow 2 minutes between the 30 second cranking periods so the starter motor can cool.

Note : If pressure is **not** indicated, find and correct the problem before continuing.

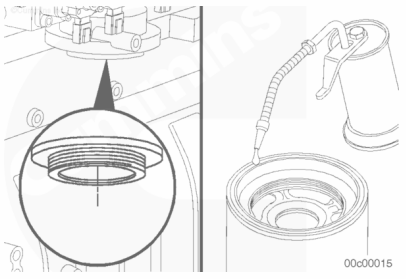
CM2350 Control Module - Connect the original equipment manufacturer (OEM) connector to the engine control module (ECM).

Allow the lubricating oil to drain into the lubricating oil pan. Measure the lubricating oil level with the dipstick.

Add lubricating oil as necessary to bring the level to the high mark.



Lubricate the gasket on the oil filter. Use clean engine lubricating oil.



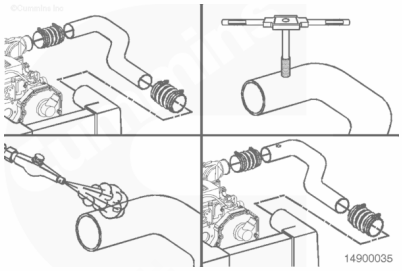
Screw the oil filter onto the filter head until the gasket contacts the filter head surface.

GRAPHIC NOT FOUND

Tighten the filter as specified by the manufacturer.

⚠ CAUTION ⚠

Do not attempt to install pipe thread fittings in plastic or rubber intake piping.

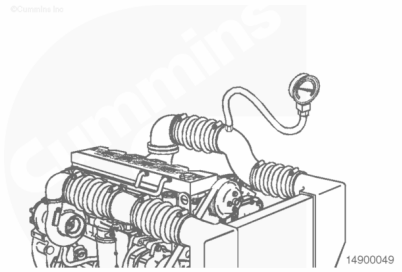


If INSITE™ electronic service tool is available, use it to monitor intake manifold pressure during the test. This eliminates the need to install a gauge as shown below.

If the air crossover tube does **not** have a pipe plug and tapped hole, perform the following procedure:

- Remove the charge air cooler air crossover tube from the engine.
- Drill and tap a 1/8 inch pipe thread hole in the tube, 101.6 to 152.4 mm [4 to 6 in] from the intake opening.
- Clean all metal shavings from the air crossover tube.
- Install the crossover tube.

To determine the amount of turbocharger boost, remove the pipe plug in the air crossover tube and install the intake manifold pressure sensor or pressure gauge, Part Number ST 1273.



Measurements		
	mm-hg	in-hg
Minimum Gauge Capacity	1905	75

Use the following procedure for an accurate engine crankcase blowby measurement. Insert a blowby checking tool in the crankcase breather vent.

For blowby specifications. Refer to Procedure 014-010 in Section 14. (/qs3/pubsys2/xml/en/procedures/100/100-014-010.html)

Connect a water manometer to the blowby tool. A pressure gauge can be used in place of the manometer.

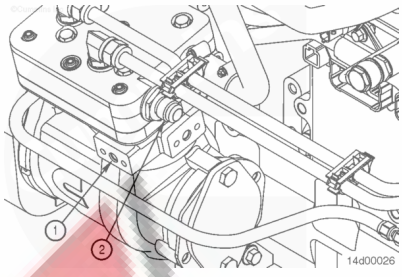
Measurements

ANADOLU ISUZU GUTER PARTS

Measurements	mm-h2o	in-h2o

	mm-h2o	in-h2o
Minimum Gauge Capacity	1270	50

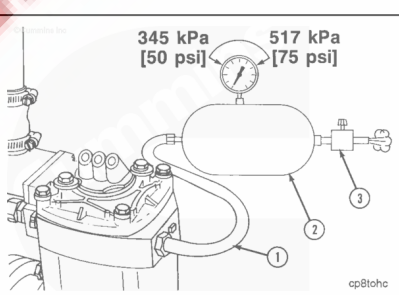
Note : All air compressors manufactured by Cummins Inc. **must** be loaded during engine run-in. All air compressors **must** be unloaded during the engine performance check.



Note : The compressed air load in the accompanying illustration **must** be attached to the air compressor outlet (2).

To be able to unload the compressor, connect a source of compressed air to the unloader (1). This air line **must** contain a valve between the source and the unloader.

Note : The engine is equipped with a variable geometry turbocharger (VGT). The turbocharger control valve will require a continuous air supply of at least 621 kPa [90 psi].

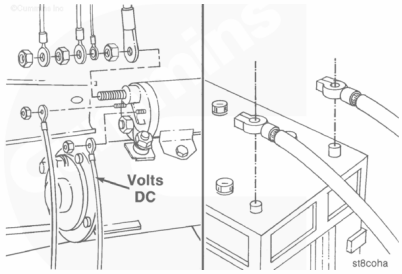


To provide a load on the air compressor, connect an air tank (2) to the compressor outlet, with steel tubing or a high-temperature hose (1).

Install an air regulator (3) that can maintain tank air pressure of 345 to 517 kPa [50 to 75 psi] at both the minimum and maximum engine rpm.

Measurements		
	celsius	fahrenheit
Hose Temperature (Minimum)	260	500

Note : If another method of starting the engine is used, use the equipment manufacturer service information to make the necessary connections.



Inspect the voltage rating on the starter motor before installing the electrical wiring.

Attach electrical wires to the starter motor and the batteries, if used.

Last Modified: 14-Sep-2016

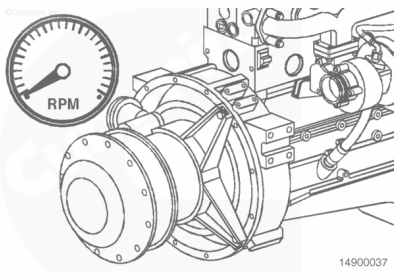
General Information

Use the following procedure for general engine dynamometer, operating/testing procedures and safety precautions. Refer to Procedure 014-005 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-005.html)

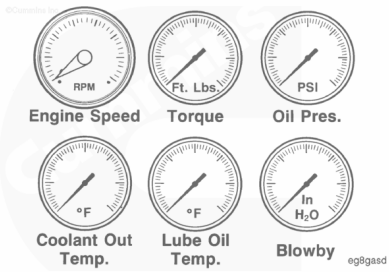
Run-In Instructions

Note : The amount of time specified for the following engine run-in phases are minimums. Additional time can be used, if desired, at each phase except engine idle periods.

The engine run-in period allows the tester to detect assembly errors and make final adjustments needed for performance that meets specifications.



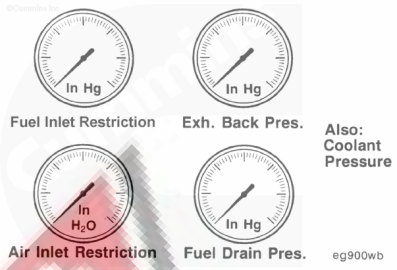
Measurements from these indicators and gauges **must** be observed closely during all phases of the engine run-in period. Refer to Procedure 014-005 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-005.html)



AYAZOĞLU ISUZU PARTS SALES

To evaluate engine performance correctly, this additional measurement **must** be observed during engine run-in phases.

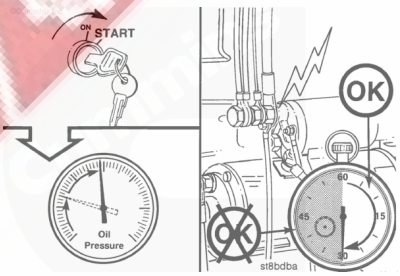
It is good practice to observe these measurements even if engine performance meets specifications. If engine performance does **not** meet specifications, these measurements can indicate possible reasons for under performance.



⚠ CAUTION ⚠

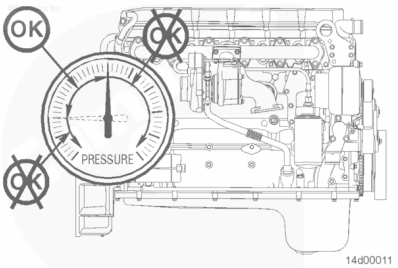
Do not crank the engine for more than 30 seconds. Excessive heat will damage the starter motor.

Crank the engine and observe the lubricating oil pressure when the engine starts. If the engine fails to start within 30 seconds, allow the starter motor to cool for 2 minutes before cranking the engine again.



⚠ CAUTION ⚠

If the lubricating oil pressure is not within specifications, shut off the engine immediately. Low lubricating oil pressure will cause engine damage.

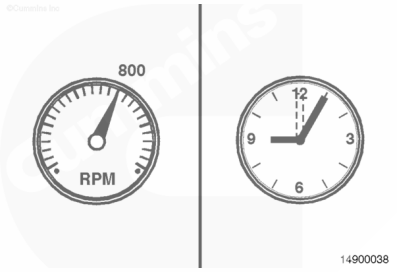


Engine lubricating oil pressure **must** be at least the minimum allowable at idle. Refer to Procedure 018-017 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-017.html)

Correct the problem if the lubricating oil pressure is **not** within specifications.

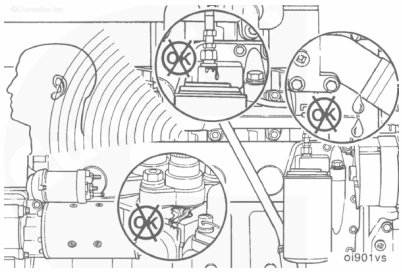
⚠ CAUTION ⚠

Do not operate the engine at idle speed longer than specified during engine run-in. Excessive carbon formation will cause damage to the engine.



Operate the engine at approximately 800 rpm for 3 to 5 minutes.

Note : Repair all leaks or component problems before continuing the engine run-in.

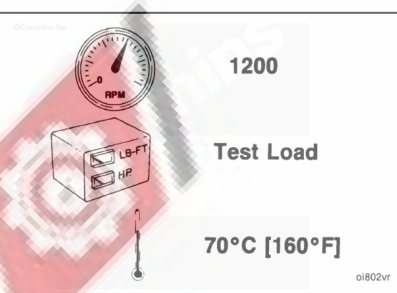


Listen for unusual noises.

Watch for coolant, fuel, and lubricating oil leaks.

Check for correct engine operation in general.

Move the throttle to obtain 1200 rpm engine speed. Set the test load to 25 percent of the rated load.

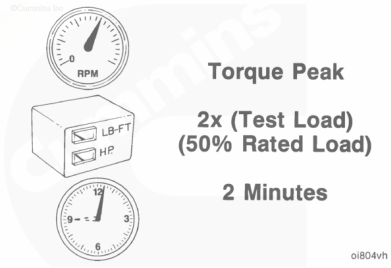


Operate the engine at this speed and load level until the coolant temperature is 70°C [158°F].

Check all gauges. Record the data.

Note : Do **not** proceed to the next step until a steady blowby reading is obtained.

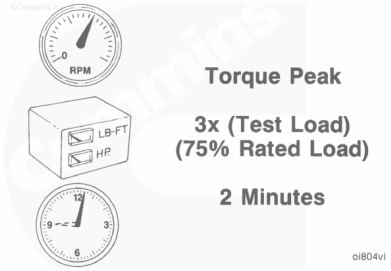
Adjust the throttle to obtain peak torque rpm. Adjust the dynamometer load to 50 percent of torque peak load. Operate the engine at this speed and load level for 2 minutes.



Check all gauges. Record the data.

Note : Do **not** proceed to the next step until blowby is stable within specifications.

With the engine speed remaining at torque peak rpm, increase the dynamometer load to 75 percent of torque peak load. Operate the engine at this speed and load level for 2 minutes.



Check all gauges. Record the data.

Note : Do **not** proceed to the next step until blowby is stable within specifications.

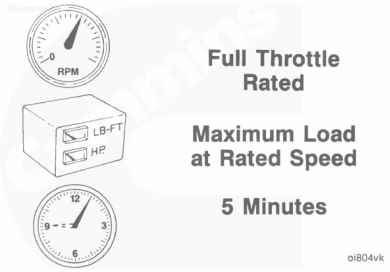
Move the throttle lever to its fully opened position. Increase the dynamometer load until the engine speed is at torque peak rpm. Operate the engine at this speed and load level for 10 minutes or until the blowby becomes stable within specifications.

Check all gauges. Record the data.

Reduce the dynamometer load until the engine speed increases to the engine's rated rpm.

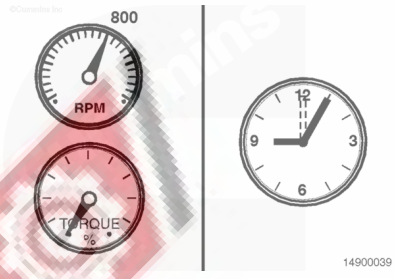
Operate the engine at rated rpm for 5 minutes.

Check all gauges. Record the data.



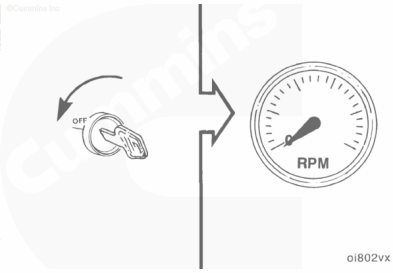
⚠ CAUTION ⚠

Shutting off the engine immediately after operating at full load will damage the turbocharger and internal components. Always allow the engine to cool before shutting it off.



Remove the dynamometer load completely. Operate the engine at 800 rpm for 3 to 5 minutes. This period will allow the turbocharger and other components to cool.

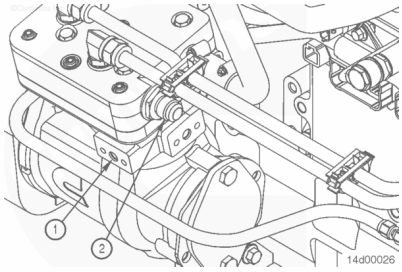
Shut the engine OFF.



Engine Dynamometer Test - Performance Check

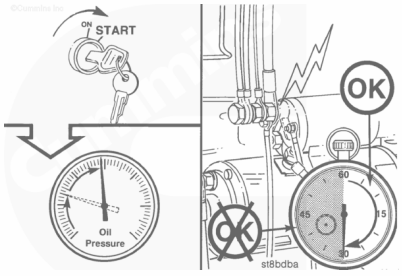
Make sure the air compressor will be unloaded during the performance check.

Apply regulated air pressure of 655 kPa [95 psi] to the air compressor unloader (1).



⚠ CAUTION ⚠

Do not crank the engine for more than 30 seconds. Excessive heat will damage the starter motor.

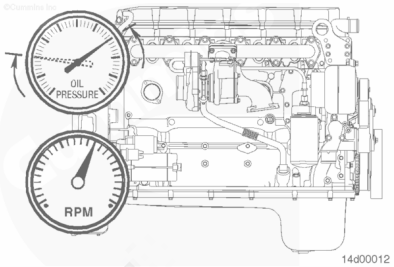


ANADOLU ISUZU
AFTER SALES

Crank the engine. Observe the oil pressure when the engine starts. If the engine fails to start within 30 seconds, allow the starter motor to cool for 2 minutes before cranking the engine again.

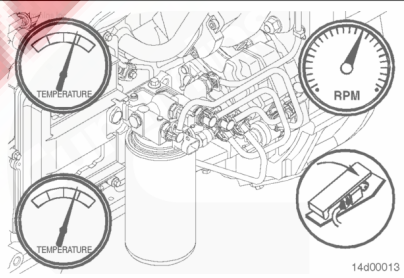
⚠ CAUTION ⚠

If the lubricating oil pressure is not within specifications, shut off the engine immediately. Low lubricating oil pressure will cause engine damage. Correct the problem if lubricating oil pressure is not within specifications.



Engine lubricating oil pressure **must** be at least the minimum allowable at idle. Refer to Procedure 018-017 in Section V. (/qs3/pubsys2/xml/en/procedures/425/425-018-017.html)

Note : The horsepower reading will **not** be accurate if the lubricating oil temperature and fuel temperature are **not** within specifications.



Make sure the engine is at operating temperature (71.1°C [160°F] minimum coolant temperature).

Move the throttle pedal to 100 percent throttle. Adjust the dynamometer load until the engine maintains the rated rpm.

Allow the readings to stabilize. Read the horsepower.

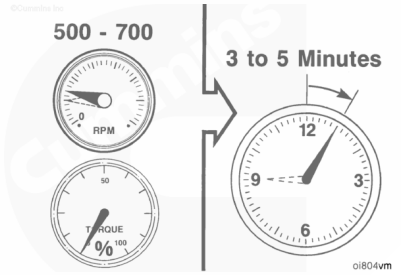
Lubricating Oil Temperature		
celsius		fahrenheit
90	MIN	194

Fuel Temperature		
celsius		fahrenheit
32	MAX	90

Check all gauges. Record the data.

⚠ CAUTION ⚠

Do not shut off the engine immediately after it has been loaded. It must be allowed to cool sufficiently.



ANADOLU ISUZU GENUINE PARTS

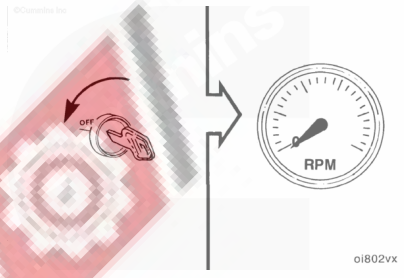
Note : Idle periods longer than 5 minutes are to be avoided.

Move the throttle lever to its fully opened position. Increase the dynamometer load until the engine speed is at torque peak rpm. Allow the readings to stabilize. Read the torque. Check all of the gauges. Record the readings.

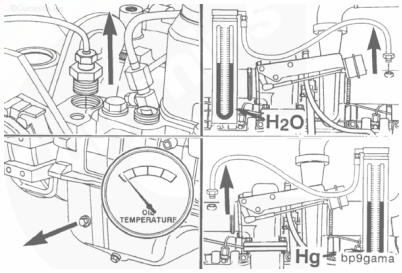
Remove the dynamometer load completely.

Operate the engine at idle speed for 3 to 5 minutes. This will allow the turbocharger and other components to cool.

Shut the engine OFF after the cool down period.



Note : If the engine is to be stored temporarily and does **not** have permanent-type antifreeze, it is necessary to drain all coolant.



Remove all test instrumentation.

Remove the engine from the dynamometer.

Prepare the engine for engine painting. Refer to Procedure 000-007 in Section 0. (/qs3/pubsys2/xml/en/procedures/425/425-000-007.html)

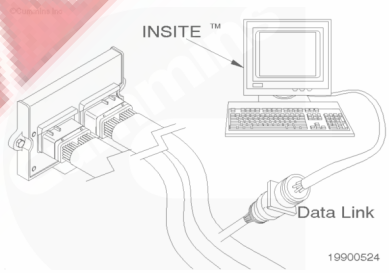
Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

Additional Service Items

- Stopwatch

Setup



The setup for dynamometer function is used to prepare the attached engine control module (ECM) for advanced diagnostic tests run on the dynamometer. For purposes of this test, the maximum engine speed without vehicle speed sensor (VSS), maximum vehicle speed in top gear, and maximum vehicle speed in lower gear are set to their maximum values. The idle shutdown feature is disabled. All of these values are automatically reset to their previous values when the engine keyswitch is in the OFF position.

Settings:

Maximum Engine Speed without VSS: For testing purposes, this speed is temporarily set to the maximum value allowed (3000 rpm).

Maximum Vehicle Speed in Top Gear; For testing purposes, this speed is temporarily set to the maximum value allowed (120 mph).

Maximum Vehicle Speed in Lower Gear: For testing purposes, this speed is temporarily set to the maximum value allowed (120 mph).

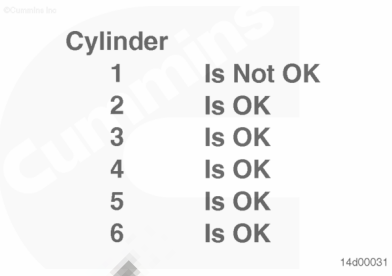
Idle Shutdown: This feature is temporarily disabled for testing purposes (Disable).

Some J1939 electronic subsystems **must** be disabled. The user has the ability to enable or disable the J1939 data link with the service tool.

See INSITE™ electronic service tool user's manual for detailed setup for dynamometer instructions.

Automated Cylinder Performance Test

The automated cylinder performance test is the most thorough test of cylinder performance (versus the single-cylinder cutout test, which tests the performance if individual cylinders **only**). The service tool **must** be attached to an ECM to perform the test. Follow the steps outlined in Preparing to Run the Automated Cylinder Performance test, to make sure the best possible outcome is achieved.



This test is automated in the sense that, once the test is started, the service tool controls what cylinders are disabled or enabled, what ECM values are recorded, and what information displays as a result of the test. Once the test is finished, follow the steps outlined in the After Running the Automated Cylinder Performance Test to make sure the engine returns to its original state.

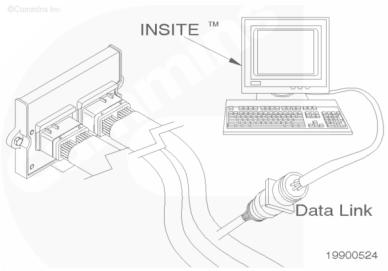
This test will produce a Pass or Fail message for each cylinder. Its percent contribution value is also displayed.

Preparing to Run the Automated Cylinder Performance Test:

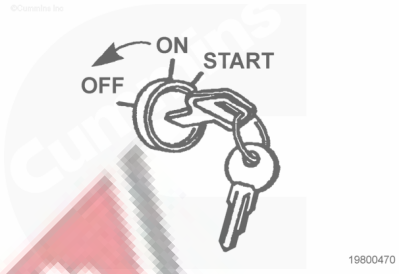
Before performing the test, make sure the following are completed:

1. Clear the areas around the engine and fan. Make sure the exhaust is vented correctly.
2. Operate the engine until the coolant temperature is a minimum of 76.7°C [170°F].
3. Shut off the engine.
4. Lock the fan clutch in the ON position for continuous operation.
5. Shut off the air conditioning.
6. Disengage any devices that can cause the load on the engine to vary.
7. With the vehicle stationary, start the engine and let it idle.
8. Start the test using INSITE™ electronic service tool.

See INSITE™ electronic service tool user's manual for detailed automated cylinder performance test instructions.



After Running the Automated Cylinder Performance Test:

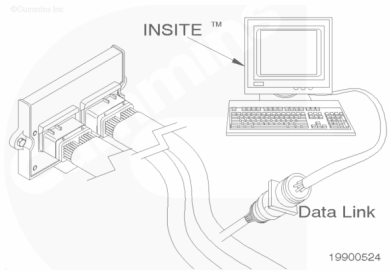


It is normal for the engine rpm to vary during the test, but if the engine rpm goes to high idle for more than 5 seconds at a time, shut off the engine.

Once the test is complete, make sure to complete the following:

1. Shut off the engine.
2. Return the fan to normal operation, if necessary.
3. Perform the suggested repairs that resulted from the test.
4. Return any disengaged devices to their normal mode of operation.

Cylinder Cutout Test



Use the Single-Cylinder Cutout Test to remove individual cylinders from the engine firing cycle and monitor a running engine while the selected cylinder is disabled. The system displays the percent load and rpm values while the cylinder is disabled.

The service tool **must** be attached to a running engine in a non-moving vehicle to perform this test.

See the INSITE™ electronic service tool user's manual for detailed cylinder cutout test instructions.

Cylinder to be Cut Out:

None: Select this option to run all cylinders.

1 to 6: Select one of these options to shut off cylinder number 1 through number 6, respectively. **Only** one cylinder can be shut off at a time.

Monitor:

ANADOLU ISUZU
OTOR SALES

Percent Load: The percent of load that the engine is carrying.

rpm: Engine revolutions per minute.

Turbocharger Actuator Test:

Use the turbocharger actuator test to verify the correct functioning of the variable geometry turbocharger actuator.

INSITE™ electronic service tool **must** be attached to an ECM to perform this test.

See INSITE™ electronic service tool user's manual for detailed turbocharger actuator test instructions.

Stall Speed Check

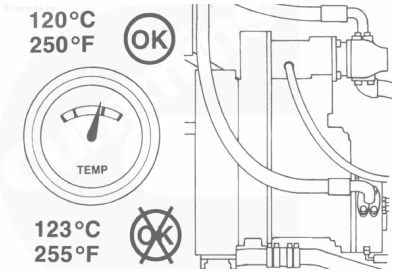
Converter Transmission Stall Speed:

The stall speed is the engine speed (rpm) obtained at full throttle when the converter output shaft is locked.

Note : It is possible the vehicle brakes will **not** hold an electronically controlled transmission.

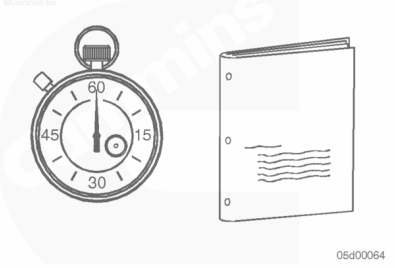
⚠ CAUTION ⚠

Do not exceed 120°C [248°F] converter oil temperature. Overheating can result and converter damage can occur. If the oil temperature exceeds 120°C [248°F], put the transmission in neutral, and operate the engine until the oil temperature is below 120°C [248°F]. Check the converter oil level.

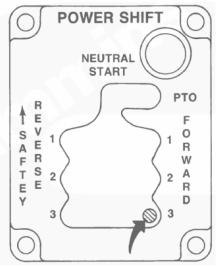


The following equipment is needed for this check:

- Stopwatch
- Equipment manufacturer stall speed and time-to-stall specifications.



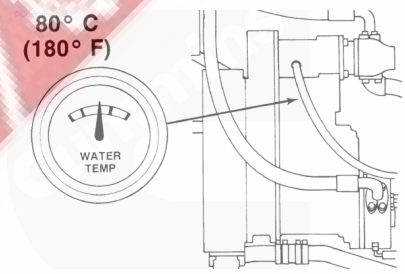
Place the gear selector in the highest gear or full forward.



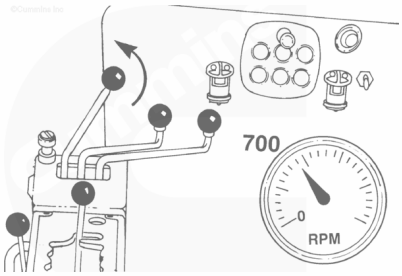
Note : The brakes **must** prevent the vehicle from moving when the engine is at full throttle. Engage the vehicle brakes to keep the vehicle from moving.

Make sure the vehicle has good brakes and air pressure in the brake system.

Operate the engine until the converter temperature is 80°C [176°F] or above.

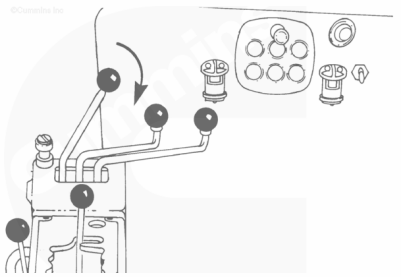


Bring the engine speed back to low idle.



⚠ CAUTION ⚠

Do not exceed 120°C [248°F] converter oil temperature. Overheating and damage to the converter can occur.

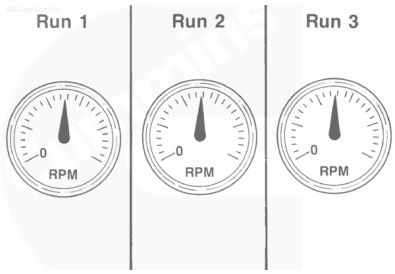


Quickly move the throttle to the full-open position with the vehicle brakes applied.

Check the engine speed (rpm) at the point of stall:

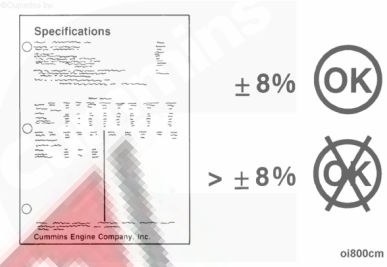
- **Always** hold the speed until it is stable.
- Take several readings.
- Make sure the readings are accurate.

ANADOLU ISUZU AFTER SALES



Note : The stall speed for the engine and converter/transmission can vary ±8 percent from manufacturer specifications.

Check the speed (rpm) against the specifications for the equipment, converter, or automatic transmission.



If the stall speed is **not** within the specifications, see the Stall Speed Checklist in this section.

Check equipment manufacturer troubleshooting procedures for other reasons for stall speed problems.

STALL SPEED CHECK LIST

IF THE STALL SPEED IS TOO LOW, CHECK THE FOLLOWING:

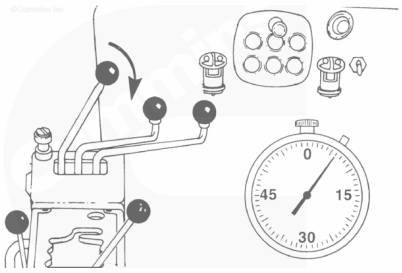
	Yes	No	
1.	. . .	. . .	The tachometer is in error.
2.	. . .	. . .	The engine is up to or above 70°C [160°F].
3.	. . .	. . .	The converter oil is up to temperature 80°C [180°F] minimum.
4.	. . .	. . .	The stall has been held long enough for the engine to accelerate to full power.
5.	. . .	. . .	The match curve stall speed was recorded correctly.
6.	. . .	. . .	The converter oil is to the converter manufacturer's recommendation. (SAE 30 instead of SAE 10 for instance.)
7.	. . .	. . .	The engine driven accessory power requirements exceed 10 percent of the gross engine power. Check for abnormal accessory horsepower losses such as hydraulic pumps, large fans, oversize compressors, etc. Either remove the accessory or accurately determine the power requirement and adjust accordingly.
8.	. . .	. . .	The AFC (Air Fuel Control) is propery adjusted.
9.	. . .	. . .	The unit is operating at an altitude high enough to affect the engine power.
10.	. . .	. . .	The converter charging pressure is correct.
11.	. . .	. . .	The tailshaft governor is interfering with and preventing a full throttle opening. (Disconnect the tailshaft governor.)
12.	. . .	. . .	The converter blading is interfering or in a stage of failure. Check the sump or filter for metal particles.
13.	. . .	. . .	The converter stators are free-wheeling instead of locking up.
14.	. . .	. . .	The engine is set for power other than that specified on the power curve.

PAŞAOĞLU ISUZU CENTER SALES

Time Speed Check

Perform the previous Stall Speed Check procedure through the ”Bring the engine speed back to low idle” step then complete the following:

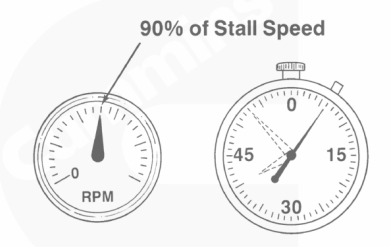
- Quickly move the throttle to the full-open position. Start the stopwatch at the same time.



Note : The type of unit and stall speed rpm can make the stall speed time a maximum of 10 seconds.

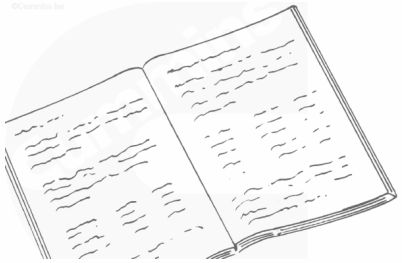
- When the engine speed is 90 percent of the stall speed rpm, stop the stopwatch.

Example: Stall speed 2089 [2089 x 0.90 = 1880 rpm].



Check equipment manufacturer specifications for the time to stall or the acceleration time.

If the time is excessive, see the Stall Speed Checklist in this procedure.



Stall Speed Checklist

Stall Speed Too Low

	Yes	No	
1.			The tachometer is in error.
2.			Engine temperature is up to or above 70°C [160°F].
3.			The converter oil is up to temperature 80°C [180°F].
4.			The stall has been held long enough for the engine to accelerate to full-power.
5.			The match curve stall speed was recorded correctly.
6.			The converter oil is to converter manufacturer recommendation (Society o Automotive Engineers (SAE) 30 instead of SAE 10, for instance).

ANADOLU ISUZU AFTER SALES

	Yes	No	
7.			The engine-driven accessory power requirements exceed 10 percent of the gross engine power. Check for abnormal accessory horsepower losses such as hydraulic pumps, large fans, oversized compressors, and so on. Either remove the accessory or accurately determine the power requirement. Adjust accordingly.
8.			The unit is operating at an altitude high enough to affect engine power.
9.			The converter charging pressure is correct.
10.			The tailshaft governor is interfering with and preventing a full-throttle opening. Disconnect the tailshaft governor. Do **not** exceed the manufacturer's maximum output speed.
11.			The converter blading is interfering or in a stage of failure. Check the sump or filter for particles.

ANADOLU ISUZU AFTER SALES

	Yes	No	
12.			The converter stators are free-wheeling instead of locking up.
13.			The engine is set for power other than that specified on the power curve.
14.			The converter is wrong due to improper build or rebuild of unit.
15.			The converter is performing to the published absorption curve.
16.			The engine and converter match is correct. Check the engine and converter models for the proper match.
17.			The engine is matched to too large of a converter. If this condition is believed to exist, please report the engine-converter-accessory information to the factory.
18.			The engine power is down. The engine torque rise could be less than shown on the standard engine curve. See the fuel setting adjustments and the turbocharger air manifold pressure check.

Stall Speed Too High

	Yes	No	

ANADOLU ISUZU AFTER SALES

	Yes	No	
1.			The engine is high in power.
2.			The tachometer is in error.
3.			The accessory power requirements are less than 10 percent of the gross engine power.
4.			The converter oil is aerating or foaming. Check for low oil level, air leaks in suction line, lack of foam inhibitor in the oil, or suction screen or filter. It will be accompanied by a noticeable loss of machine performance.
5.			The converter is being held at full-stall. Check for slipping front disconnect clutch or a rotating output shaft. On the converter-transmission package, this can be impossible to check.
6.			The converter turbine element is beginning to fail and lose blades, or the converter was originally built with the wrong size element.

ANADOLU ISUZU AFTER SALES

	Yes	No	
7.			The engine and converter match is correct due to a revision in the engine rating or the converter performance.
8.			If the oil level is too high on the transmission-converter units with the oil sump in the transmission, it can cause severe aeration due to parts dipping into the oil.
9.			The converter is performing to the published absorption curve.
10.			The converter charging pressure is correct.

The reasons for abnormal stall speeds listed above are some encountered by Cummins Inc. representatives and probably do **not** include all possible causes. The correction of the problem is either covered in the vehicle service manual, the converter service manual, or is self-explanatory.

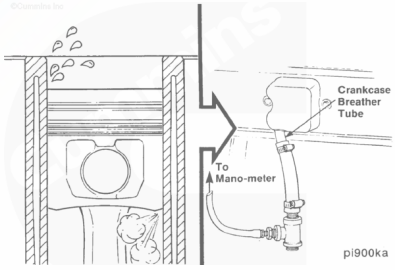
- No additional service items required.

General Information

Excessive crankcase blowby can indicate an engine or engine-related component malfunction that allows combustion gases or air to enter the crankcase. This results in the buildup of higher than normal crankcase pressure, which results in increased levels of blowby.



This procedure describes how to measure crankcase blowby and how to determine what component is malfunctioning.

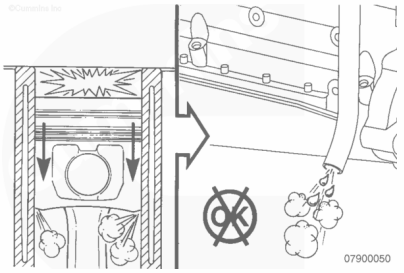
Blowby is typically measured for the following situations:

- Verifying engine break-in after an engine rebuild
- Troubleshooting for excessive lubricating oil out of the crankcase breather tube, commonly referred to as oil carryover (for open crankcase ventilation systems)
- Troubleshooting oil in the air intake system (for closed crankcase ventilation systems)
- Troubleshooting high crankcase pressure (for engines equipped with a crankcase pressure sensor)
- Troubleshooting possible internal engine damage (worn piston rings, valve stem seals, or guides, turbocharger, air compressor, etc.).

Note : For specific crankcase gases (blowby) symptom information and direction, see the Crankcase Gases (Blowby) Excessive troubleshooting symptom tree in Section TS.

The following measure step will give general guidelines for measuring blowby relative to the above situations.

Note : Some illustrations in this procedure do **not** show actual engine configurations. However, the procedure is the same.



It is important to note the terms blowby and carryover (oil out of the breather tube) are commonly used interchangeably.

When measuring blowby, and there is an excessive amount of oil coming out of the breather tube, the quantity of oil can affect the blowby measurement.

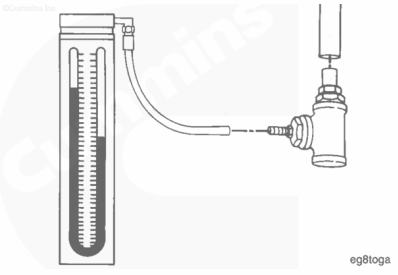
The blowby measurement is affected by the oil collecting on the orifice of the blowby measurement service tool. This reduces the size of the orifice, which results in higher than actual blowby measurements.

If this occurs, it will be necessary to:

- Find a different location on the engine to measure blowby (oil fill, oil fill cap, unused turbocharger drain location, etc.).
- Clean any oil residue from the breather. Dry thoroughly before measuring blowby.

Determine if there is an issue causing the breather to be flooded with oil, for example:

- Incorrect oil level
- Vehicle operation (excessive angularity, excessive engine side-to-side movement)
- Internal engine components deflecting oil toward the breather cavity (piston cooling nozzles, accessory oil drains, etc.)
- Determine if another breather option is available for the engine being serviced.



The tools used to measure blowby are similar in design. The difference between the tools is in the size of the orifice. Different size orifices are available to more accurately measure blowby by accommodating the wide variety of engine configurations and ratings. This is due to the fact engine blowby is dependent on the volume of intake airflow.

For example:

If measuring blowby on two identically configured and sized engines, but the horsepower ratings and rated speed are different, the maximum blowby values measured will be different.

The engine with the higher horsepower rating and rated speed will have a higher volume of intake airflow, which will result in higher blowby. This means if the smaller orifice blowby tool was used on the engine with a higher horsepower rating and rated speed, the measurement can exceed the limits of the pressure measuring tool.

Blowby Tool Part Number	Orifice Size mm [in]
3822476	5.61 mm [0.221 in]
3822566	7.67 mm [0.302 in]

To measure the crankcase blowby pressure, connect water manometer, Part Number ST 1111 3, or equivalent, pressure gauge, or transducer to the blowby tool.

Note : Cummins® water manometer, Part Number ST 1111 3, can measure a maximum of 944 mm [36 in] of water.

The following charts show the relationship of measured pressure to flow rate, depending on the blowby tool used.

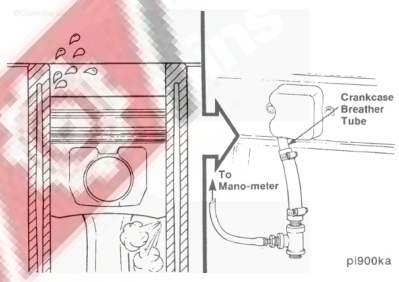
The following chart contains general blowby specifications. Due to the wide variety of engine types, configurations, and ratings, these specifications are intended to **only** be used as a guide to help identify if a problem exists. These specifications are **not** intended to be used as engine condemnation limits.



Note : If internal engine damage is suspected to be the cause of the excessive blowby condition, other steps can be taken to confirm this.

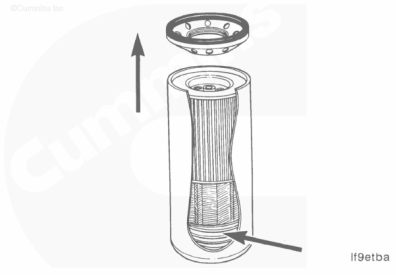
Measuring blowby **must only** be considered when confirming engine break-in after a rebuild or if another symptom is present. These symptoms can include:

- Excessive carryover (oil out of the crankcase breather tube)
- High crankcase pressure (for engines equipped with a crankcase pressure sensor)
- Low power
- Oil consumption
- Exhaust smoke.

If no other symptom is present, blowby measurements need **not** be taken.

If internal engine damage is suspected to be the cause of the excessive blowby condition, other steps can be taken to confirm this. The steps include:

- Confirm engine maintenance practices.
- Cut the oil filter open. Check for debris.
- Take an oil sample and inspect for contamination.

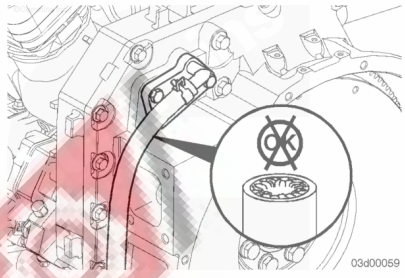


Blowby Tool Part Number

Blowby Specifications For New or Rebuild - mm [in] H_2O	Blowby Specification For Troubleshooting - mm [in] H_2O
203.2 [8]	304.8 [12]

Initial Check

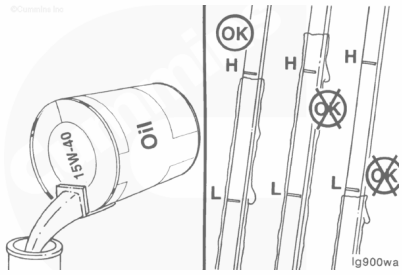
Note : The location and type of crankcase breathers vary by engine configuration (Front Gear Train or Rear Gear Train) and/or engine application (Marine, Industrial, and Automotive).



Prior to measuring blowby pressure, check the crankcase breather tube for obstructions. Refer to Procedure 003-018 in Section 3. (/qs3/pubsys2/xml/en/procedures/425/425-003-018.html)

If troubleshooting a complaint of excessive oil out of the breather tube, it can be necessary to remove the breather components to clean and remove any lubricating oil buildup before performing any blowby measurements.

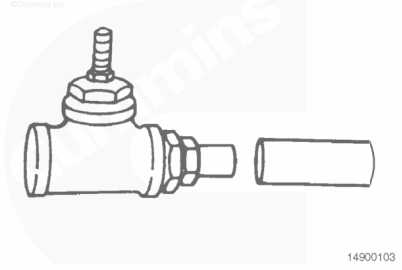
Check the engine oil level and, if necessary, proper calibration of the dipstick. If the level is too high, it can cause a higher than normal blowby pressure and/or excessive carryover. Refer to Procedure 007-037 in Section 7. (/qs3/pubsys2/xml/en/procedures/425/425-007-037.html)



Measure

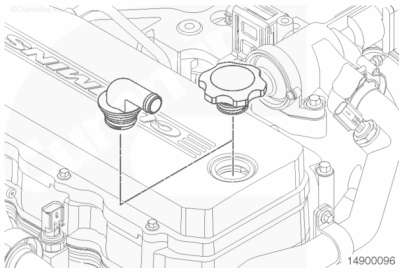
Obtain the appropriate blowby measurement service tool.

Blowby Tool Part Number	Orifice Size mm [in]
3822566	7.67 mm [0.302 in]

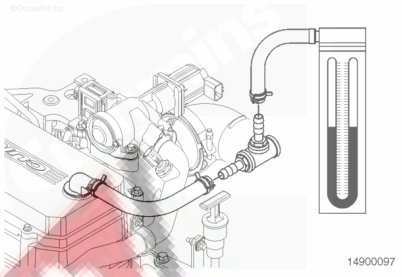


Use the following steps to connect the blowby measurement tools.

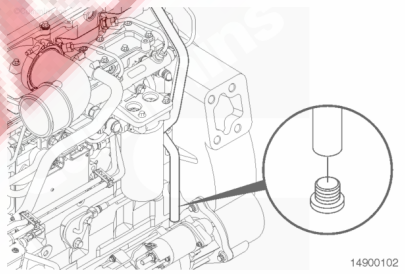
- Remove the oil fill cap from the rocker lever cover. Install oil fill adapter, Part Number 3990099.



- Connect the blowby measurement service tool to the outlet of the oil fill adapter. Connect a water manometer, Part Number ST 1111 3, pressure gauge, or transducer to the blowby measurement service tool.



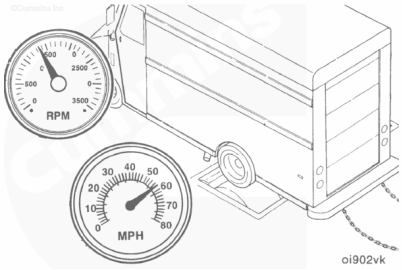
- Use a suitable fitting to plug the crankcase breather tube.



Engine Blowby Contribution:

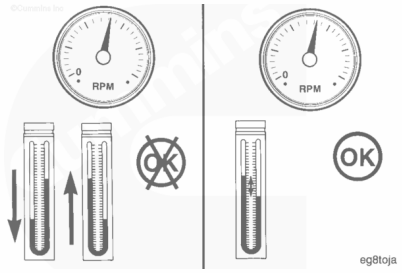
Operate the engine at rated speed and under load by:

- For engine run-in, a chassis dynamometer or engine dynamometer.
- For engine testing, a chassis dynamometer or engine dynamometer.
- A stall speed test (for engines equipped with automatic transmissions **only**).



⚠ CAUTION ⚠

When measuring blowby and there is an excessive amount of oil coming out of the breather tube, the quantity of oil can affect the blowby measurement.



Operate the engine at rated rpm and full load until a steady reading is obtained.

Note : When measuring blowby, the value can “spike” initially as the engine reaches peak power and rated

ANADOLU ISUZU AFTER SALES

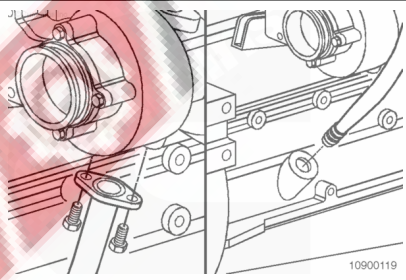
speed. Wait for the blowby measurement to stabilize before taking a reading.

Note : For engine run-in, if a sudden increase in blowby occurs, or if blowby exceeds the maximum allowable limit during any run-in step, return to the previous step and continue the run-in. If blowby does **not** reach an acceptable level, discontinue the run-in and determine the cause.

Record the steady blowby measurement.

Remove the engine blowby service tool and the water manometer, pressure gauge, or transducer, if the blowby is within specification.

Turbocharger Blowby Contribution:

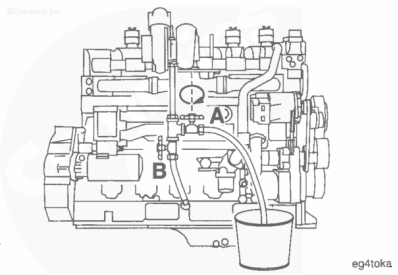


Note : For engines equipped with dual turbochargers, the Turbocharger Oil Drain Line Isolation Test may need to be conducted twice to determine which turbocharger is contributing high blowby. The first test should be conducted with both turbocharger drain lines isolated. If the blowby contribution is above specifications, conduct a second test with **only** the low pressure turbocharger oil drain line isolated. If the blowby contribution is within specification, inspect the compressor and turbine areas of the low pressure turbocharger for signs of an oil leak. Replace the low pressure turbocharger, if necessary. If the blowby contribution is out of specification, replace the high pressure turbocharger.

With the engine blowby service tool and water manometer or pressure gauge still installed:

- Isolate the turbocharger, if equipped, to determine if the high blowby pressure is due to turbocharger seal leakage.
- To measure the turbocharger blowby contribution, disconnect the turbocharger oil drain line. Refer to Procedure 010-045 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-045.html)

Preferred Turbocharger Isolation Method:

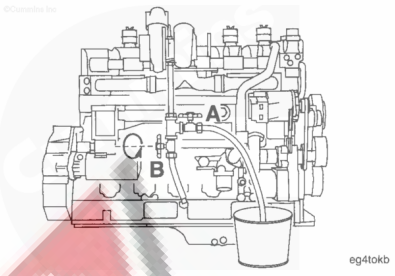


Install a hose assembly with two shutoff valves (A and B), as shown in the illustration, between the turbocharger and turbocharger drain line location in the cylinder block. The valves **must** have a minimum inside diameter of 19 mm [0.75 in]. Place the other hose in a 8 to 9 liter [2 to 3 gal] container.

Note : Some turbocharger oil drain tubes are a single one piece tube. It can be necessary to create a turbocharger isolation tool. Use a new or used turbocharger drain line and cut a middle section out of the turbocharger drain line to fit the check valves and hoses.

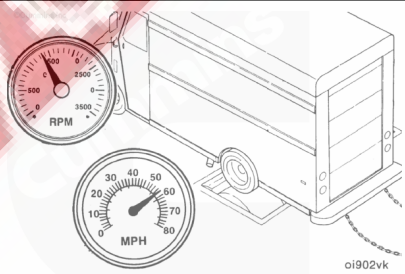
Close the valve (A) that allows oil to drain into the bucket.

Open the valve (B) that allows oil to drain into the engine.



Operate the engine at rated speed and under load by either:

- For engine testing, a chassis dynamometer or engine dynamometer
- A stall speed test (for engines equipped with automatic transmissions **only**).

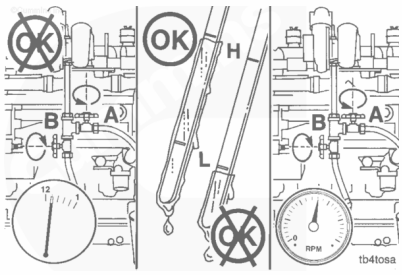


Operate the engine at rated rpm and full load until a steady reading is obtained.

Note : When measuring blowby, the value can “spike” initially as the engine reaches peak power and rated speed. Wait for the blowby measurement to stabilize before taking a reading.

⚠ WARNING ⚠

To reduce the possibility of personal injury, keep hands, long hair, jewelry, and loose fitting or torn clothing away from fans and other moving parts.



⚠ WARNING ⚠

Troubleshooting presents the risk of equipment damage, personal injury, or death. Troubleshooting must be performed by trained, experienced technicians.

⚠ CAUTION ⚠

Do not operate the engine with valve (A) open and valve (B) closed for more than 1 minute. Monitor the amount of oil accumulating in the bucket. The engine can run

out of lubricating engine oil and severe engine damage will occur.

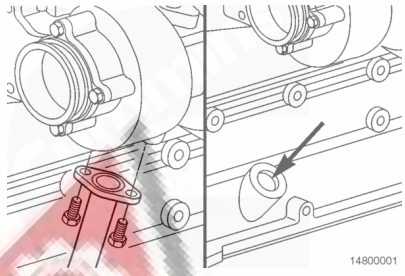
Continue operating at rated speed and load.

Open valve (A) and close valve (B).

Record the blowby pressure reading.

⚠ CAUTION ⚠

Do not operate the engine for more than 1 minute. Monitor the amount of oil accumulating in the container. The engine can be run out of lubricating engine oil and severe engine damage will result.



Alternate Turbocharger Isolation Method:

With the turbocharger oil drain line disconnected from the cylinder block, run the turbocharger drain line into a large container.

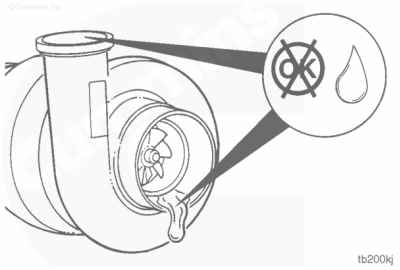
Plug the turbocharger oil drain port in the cylinder block.

Operate the engine at rated speed and under load by either:

- For engine testing, a chassis dynamometer or engine dynamometer
- A stall speed test (for engines equipped with automatic transmissions **only**).

Record the peak blowby pressure measurement.

Determine the turbocharger blowby pressure contribution by determining the difference in the blowby pressure measurement with the turbocharger drain isolated, valve (A) open, and turbocharger drain **not** isolated, valve (A) closed.

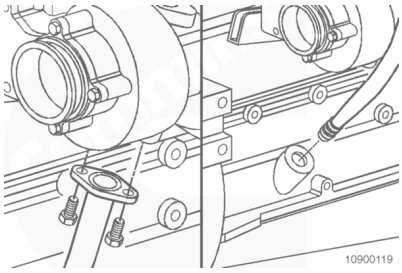


Blowby Pressure Differential	
Turbocharger Blowby Contribution	Maximum: 30 percent

If the turbocharger blowby contribution is out of specification, inspect the compressor and turbine areas of the turbocharger for signs of an oil leak. Replace the turbocharger, if necessary. Refer to Procedure 010-033 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-033.html)

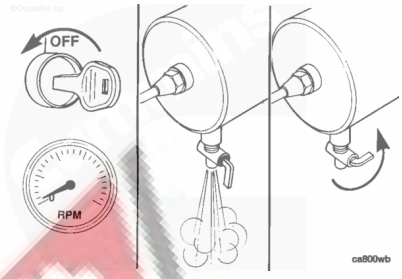
If installed, remove the turbocharger oil drain line assembly and shutoff valves. Refer to Procedure 010-045 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-045.html)

Check the engine oil level and add oil, if necessary.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

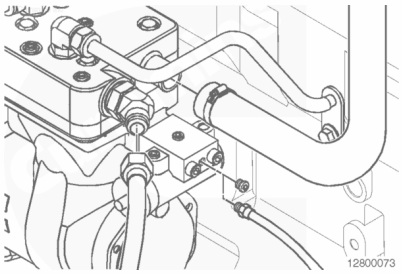


Air Compressor Blowby Contribution:

With the engine blowby service tool and water manometer, pressure gauge, or transducer still installed, isolate the air compressor, if equipped, to determine if there is internal damage to the air compressor contributing to high engine crankcase pressure. The air compressor can be isolated by unloading the air compressor.

With the engine shut off, bleed the vehicle's air system down by opening the drain cock on the wet tank to release compressed air from the system.

Note : The air compressor governor/unloader location can vary on each engine application. The air governor/unloader can be air compressor mounted or chassis mounted.



Disconnect the air signal line from the air compressor governor/unloader air signal port.

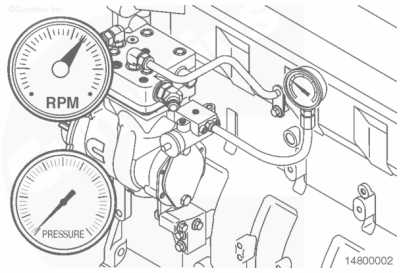
Disconnect the air compressor discharge line and air intake hose from the air compressor.

Note : On turbocharged air compressors, make sure to plug the air intake hose connected to the engine intake manifold or the engine will **not** reach full power during test.

To unload the air compressor, determine the pressure needed at the governor/unloader air signal port to start and stop the air compressor from pumping.

Note : Typical 621 kPa [90 psi] of air pressure is the set point between starting and stopping of the air

compressor pumping. See equipment manufacturer service information.



Connect a regulated shop air pressure line, with pressure gauge, to the air compressor governor/unloader air signal port.

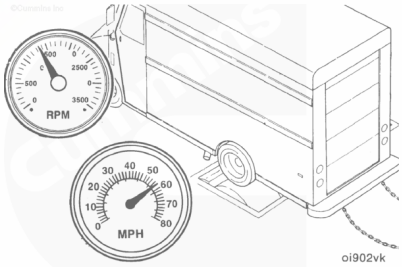
Note : When performing the test, make sure that the air system pressure does **not** exceed the manufacturer's maximum allowable pressure.

Run the engine and increase the signal pressure to the air governor/unloader to determine when the air compressor will stop pumping (system pressure stops rising at this point). Record the signal line pressure.

Reduce the signal pressure to determine when system pressure starts the air compressor pumping again (system pressure will begin to rise again at this point). Record the signal line pressure.

Note : Allow the air compressor to pump long enough to build enough pressure in the system to release and operate the air brakes.

With the regulated shop air pressure line still connected to the air compressor governor/unloader air signal port, regulate the signal pressure so that the air compressor starts pumping (system pressure will begin to rise again at this point). Use the pressure value recorded previously as a set point.



Operate the engine at rated speed and under load by either:

- For engine testing, a chassis dynamometer or engine dynamometer.
- A stall speed test (for engines equipped with automatic transmissions **only**).

Operate the engine at rated rpm and full load until a steady reading is obtained.

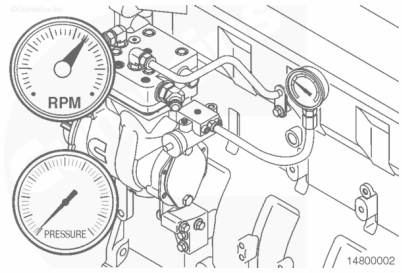
Note : When measuring blowby, the value can “spike” initially as the engine reaches peak power and rated speed. Wait for the blowby measurement to stabilize before taking a reading.

Continue operating the engine at rated speed and load.

Increase the signal pressure (system pressure stops rising at this point). Use the pressure value recorded previously as a set point.

Operate the engine at rated rpm and full load until a steady reading is obtained.

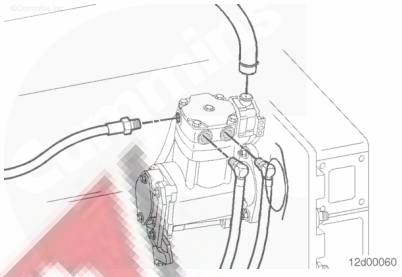
Note : When measuring blowby, the value can “spike” initially as the engine reaches peak power and rated speed. Wait for the blowby measurement to stabilize before taking a reading.



Determine the air compressor blowby pressure contribution by determining the difference in the blowby pressure measurement with the air compressor pumping and the air compressor **not** pumping.

Blowby Pressure Differential	
Air Compressor Contribution	Maximum: 30 percent

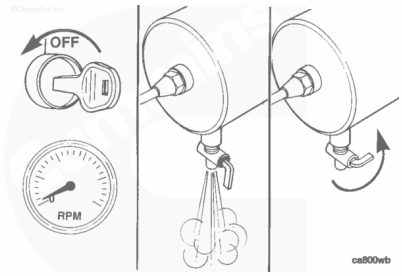
If the air compressor blowby contribution is out of specification, replace the air compressor. Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

With the engine shut off, bleed the vehicle's air system down by opening the drain cock on the wet tank to release compressed air from the system.



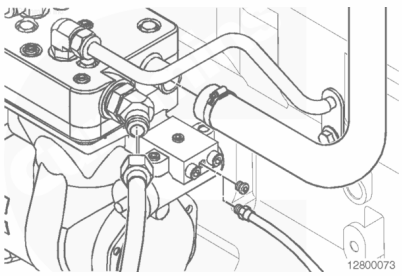
Disconnect the regulated shop air pressure line, with pressure gauge, from the air compressor governor/unloader air signal port.

Connect the air signal line. See equipment manufacturer service information.

Remove the engine blowby service tool and water manometer or pressure gauge if the blowby is within specification.

Note : On turbocharged air compressors, make sure to remove the plug previously installed in the air intake hose connected to the engine intake manifold.

Connect the air compressor discharge line and air intake hose from the air compressor.



ANADOLU ISUZU PARTS

Base Engine Component Blowby Contribution:

Base engine components can also be contributing factors of increased crankcase blowby and higher than normal crankcase pressure. Reference the Crankcase Gases (Blowby) Excessive troubleshooting symptom tree in Section TS of the appropriate engine service manual to evaluate the remaining possible causes for increased blowby and higher than normal crankcase pressure. The following are listed as possible base engine component causes:

- Valve stem clearance is excessive or the valve stem seals are damaged. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Cylinder head valve guides are excessively worn. Refer to Procedure 002-004 in Section 2. (/qs3/pubsys2/xml/en/procedures/425/425-002-004.html)
- Air compressor is malfunctioning. Refer to Procedure 012-014 in Section 12. (/qs3/pubsys2/xml/en/procedures/425/425-012-014.html)
- Piston or piston rings are worn or damaged. Refer to Procedure 001-043 in Section 1. (/qs3/pubsys2/xml/en/procedures/425/425-001-043.html)

Select Service Tools

Recommended Cummins® Service Tools

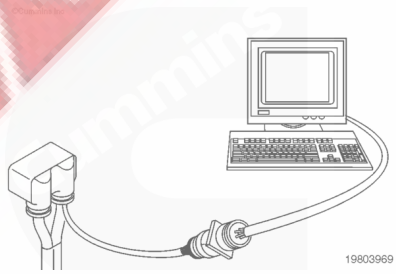
- No Cummins® service tools required.

Additional Service Items

- No additional service items required.

General Information

The INSITE™ electronic service tool Fuel Injector Performance Test is a diagnostic test used to identify malfunctioning fuel injectors. When initiated, the test will increase engine rpm to a specified value and then perform a number of engine decelerations. During these engine decelerations, fuel pressure stability is verified, fuel pressure drop is monitored, fuel injectors are fired, and fuel injector operation is evaluated. At the conclusion of the test, the engine will return to idle and injectors will be identified as either a pass or fail.



The Fuel Injector Performance Test can take up to 30 minutes to complete.

Check for active fault codes prior to performing this procedure. If any active fault codes are present, follow the appropriate fault code troubleshooting tree.

Preparatory Steps

⚠ WARNING ⚠

The test will produce significant engine noise due to the varying engine speeds that will occur during the test process. Do not perform this test in an enclosed environment. Move the equipment to a secluded location. To reduce the possibility of personal injury, hearing protection must be used while conducting this test.

⚠ CAUTION ⚠

The Fuel Injector Performance Test operates the engine at varying speeds from idle to 2000 rpm. Engine speed will change significantly during the test process.

To perform the Fuel Injector Performance Test, connect INSITE™ electronic service tool and check for active fault codes. Any fault codes related to the fuel system, such as Fault Code 3727, 559, or 553, injector circuit Fault Code 322, 323, 324, 325, 331, or 332, or high aftertreatment temperature Fault Code 3311, or 3312, go to section TF for fault code troubleshooting before proceeding. Do **not** perform the Fuel Injector Performance Test with active fault codes, unless guided to do so by the fault code troubleshooting.

Note : The Fuel Injector Performance Test is designed to run on standard Number 2 diesel fuel. Low fuel viscosity; for example, Number 1 diesel fuel, kerosene, or aviation fuel, will result in erroneous test results. Verify the fuel type being used before running the Fuel Injector Performance Test.

Before performing the Fuel Injector Performance Test, follow the steps listed below:

1. Select an appropriate location to park the vehicle.
    - The Fuel Injector Performance Test is an extremely noisy test.
    - Do **not** perform the Fuel Injector Performance Test in the shop.
    - Move the vehicle to a secluded location, such as a back parking lot.
    - Perform the test on a reasonably level surface.
2. Park the truck securely.
    - Verify parking brake operation per the vehicle manufacturers specifications.
    - Set the parking brake.
    - Turn engine brakes off.
    - Place the transmission in Park, if provided; otherwise in Neutral.
    - Set wheel chocks at the front and rear of at least one tire.
3. Set up a safe area.
    - If by-standers might enter the area, set up barriers to keep people at least 1.5 m [5 ft] from the front and rear of the vehicle during the Fuel Injector Performance Test.
    - Make certain the cab and sleeper are clear of occupants.
    - Keep a fire extinguisher nearby.
4. Prepare for engine speed changes during the Fuel Injector Performance Test.
    - Do **not** operate any power takeoff (PTO)-powered devices. Disconnect these devices before starting the Fuel Injector Performance Test.
    - Stay clear of the engine compartment.
5. Begin the Fuel Injector Performance Test.
    - Use INSITE™ electronic service tool to perform the Fuel Injector Performance Test.
    - Engine speed will increase to a specified value and then the engine control module (ECM) will perform a number of engine decelerations. During these engine decelerations, fuel pressure stability is verified, fuel pressure drop is monitored, fuel injectors are fired, and fuel injector operation is evaluated.
    - At the conclusion of the test, the engine will return to idle and suspect fuel injectors will be identified as either pass or fail.
6. Monitor the area.

- Make sure the vehicle and surrounding area are monitored during Fuel Injector Performance Test. If any unsafe condition occurs, shut the engine off immediately.

To stop the Fuel Injector Performance Test, click on the STOP button on the INSITE™ electronic service tool screen. The Fuel Injector Performance Test can also be stopped by engaging the clutch, brake, or throttle pedal; or by turning the engine OFF.

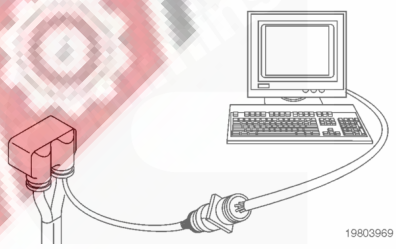
Once the Fuel Injector Performance Test is complete, the engine will return to idle. INSITE™ electronic service tool will display the test results for review.

Setup

Start the engine. Bring it to operating temperature (above 70°C [158°F]).

Allow the engine to idle.

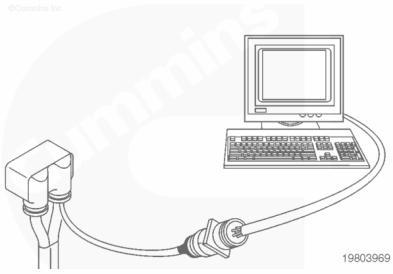
Connect INSITE™ electronic service tool.



Test

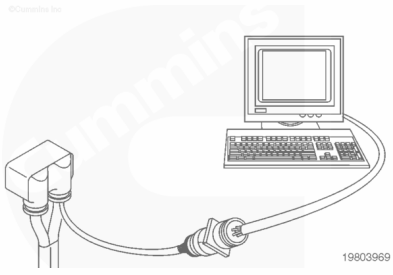
The Fuel Injector Performance Test can be found under the ECM Diagnostic Test menu in the INSITE™ electronic service tool.

Follow the on-screen prompts to perform the test.



When the test is started, engine speed will be raised automatically to the required level. Engine speed will reach between 1800 and 2000 rpm.

The engine will then, through the engine controls, operate in a manner to test the fuel injectors. The engine will enter a motoring event. Engine speed will drop to approximately 1000 rpm. During this motoring event, the fuel pressure and fuel injectors will be tested. Engine speed will then return to between 1800 and 2000 rpm and the sequence will repeat. This is normal.

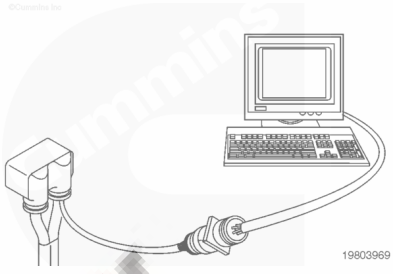


ANADOLU ISUZU USED SALES

This process can repeat as many as 24 times before the test is complete.

Once the Fuel Injector Performance Test is complete, the engine will automatically return to normal idle speed.

Note : If the Fuel Injector Performance Test will **not** initiate, a message will be displayed. The identified issue will need to be corrected before continuing.



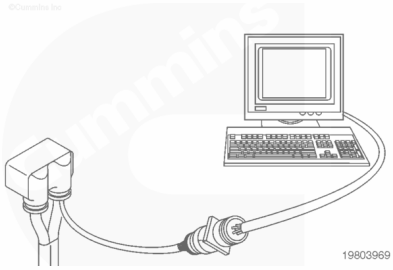
Note : If the Fuel Injector Performance Test aborts, a message will be displayed. The identified issue will need to be corrected before continuing or restarting the Fuel Injector Performance Test.

The Fuel Injector Performance Test can take up to 30 minutes to complete. At any time, the Fuel Injector Performance Test can be aborted by clicking on the STOP button in INSITE™ electronic service tool.

The Fuel Injector Performance Test will also be aborted if:

- A fault becomes active
- Accelerator is depressed
- Clutch pedal is depressed
- Brake pedal is depressed
- Transmission is put into gear
- High aftertreatment temperature faults are generated.

If INSITE™ electronic service tool Fuel Injector Performance Test will **not** activate, a message will be displayed. Correct the issue identified before proceeding. See the Fuel Injector Performance Test - Will Not Activate troubleshooting symptom tree in Section TS.

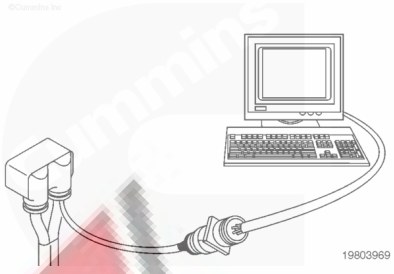


Possible causes include:

- Low coolant temperature (below 72C [162F])
- Fuel system faults are active
- Clutch switch malfunction
- Brake switch malfunction
- Parking brake **not** set
- Accelerator pedal malfunction
- Transmission in gear
- Vehicle speed greater than 0 mph
- PTO engaged
- Engine protection
- Aftertreatment regeneration active
- High aftertreatment temperature faults
- Another diagnostic test is running.

Note : If the Fuel Injector Performance Test will **not** initiate due to the parking brake **not** set, review features and parameters in INSITE™ electronic service tool. The Parking Brake Switch is defaulted to Enable. If the parking brake status is **not** transmitted to the ECM, this parameter should be set to Disabled for the Fuel Injector Performance Test to run properly.

If the Fuel Injector Performance Test is aborted for any reason, INSITE™ electronic service tool will display a message describing why the test was aborted. Correct the issue identified before proceeding. See the Fuel Injector Performance Test - Will Not Complete troubleshooting symptom tree in Section TS.

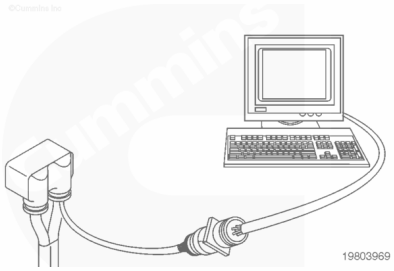


The Fuel Injector Performance Test will **not** complete if:

- Any of the causes listed for the Fuel Injector Performance Test can **not** initiate above
- A fault becomes active
- Accelerator is depressed
- Clutch pedal is depressed
- Brake pedal is depressed
- Transmission is put into gear
- High aftertreatment temperature faults
- High fuel system leakage
- Fuel pressure instability
- Self pumping
- Engine speed too low
- Engine speed too high.

Pass or Fail Criteria:

Note : The Fuel Injector Performance Test is designed to run on standard Number 2 diesel fuel. Low fuel viscosity; for example, kerosene or aviation fuel, will result in erroneous test results.



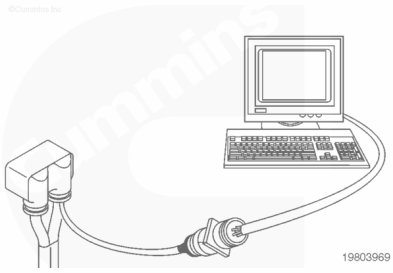
INSITE™ electronic service tool will display the pass/fail test results on screen.

If one or two individual fuel injectors fail one or more test points of the Fuel Injector Performance Test, replace those fuel injectors. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

If all fuel injectors in a bank (1, 2, and 3 for the front bank or 4, 5, and 6 for the rear bank) show failed on test point 2 and 3 or 3 and 4 the fuel injector driver in the ECM is suspect.

ANADOLU ISUZU DEALER SALES

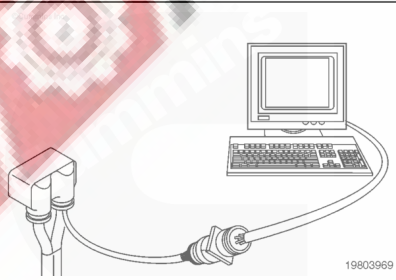
To verify, use the injector cut-out test to cut out the front bank of fuel injectors. Perform a brief snap throttle. Note how the engine accelerates. Enable the front bank of fuel injectors. Cut out the rear bank of fuel injectors. Perform a brief snap throttle. Note how the engine accelerates.



If the engine accelerates slowly on the same bank indicated by the Fuel Injector Performance Test results, replace the ECM. Refer to Procedure 019-031 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-031.html)

If there is no noticeable difference in engine acceleration from bank to bank, replace the fuel injectors in that bank. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

If all the fuel injectors show failed on test point 2 and 3 or 3 and 4, the fuel injector drivers in the ECM are suspect.



Verify the customer complaint is for low power, and/or Fault Code 125.

Replace the ECM. Refer to Procedure 019-031 in Section 19. (/qs3/pubsys2/xml/en/procedures/425/425-019-031.html)

Finishing Steps

- Do **not** turn the key OFF until the test has completed and the results are displayed.
- A copy of the Fuel Injector Performance Test results **must** be printed and returned with the malfunctioning ECM. Do **not** print the screen. Instead, print a copy of the file generated by INSITE™ electronic service tool. The file can be found by opening the start menu, then click on computer, then C:, then Intellect, then Fuel Injector Performance Test. The file can be identified by the date and time the test was performed. Open the file. Verify the engine serial number (ESN) matches the ESN of the corresponding engine.
- Check to make sure the CHECK ENGINE lamp and/or malfunction indicator lamp (MIL) lamp are **not** illuminated.
- Check for any active fault codes. If active fault codes are present, use Section TF for fault code troubleshooting.
- Use INSITE™ electronic service tool to clear all inactive fault codes.

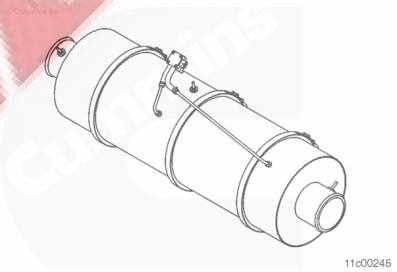
General Information



11c00245

Use the following procedure for additional information on the aftertreatment system. Refer to Procedure 011-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-011-999.html)

The following procedure contains information about how to inspect the aftertreatment DPF and perform a stationary regeneration.

There are two main steps when checking the DPF:

- The Initial Check section of this procedure is used to determine the condition of the aftertreatment DPF without removal of the filter. The Initial Check step should be used to determine if the aftertreatment DPF has malfunctioned due to progressive damage.
- The Test section of the procedure explains how to perform a stationary regeneration using an electronic service tool or an original equipment manufacturer (OEM)-provided stationary regeneration method. The Test step should **only** be performed when troubleshooting procedures and/or engine indicator lamps indicate this is necessary.

If the aftertreatment DPF requires replacement, before replacing:

- Troubleshoot and clear all fault codes.
- Verify the correct fuel type is being used.
- Troubleshoot **any** oil consumption complaint.
- Troubleshoot **any** coolant consumption complaint.

- Inspect the diesel oxidation catalyst (DOC). Refer to Procedure 011-049 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-049.html)

The INSITE™ electronic service tool Aftertreatment DPF Stationary Regeneration Test can be used to:

- Regenerate an aftertreatment DPF.
- Recover the aftertreatment DOC and aftertreatment DPF after coolant contamination.
- Reset the stored soot load in the engine control module (ECM).
- Check the aftertreatment DOC efficiency.
- Check for the presence of the aftertreatment DOC.
- Check for the correct installation of the aftertreatment temperature sensors.

The INSITE™ electronic service tool Aftertreatment DPF Stationary Regeneration Test can be used to regain functionality of the aftertreatment DOC and aftertreatment DPF, after either or both have been exposed to coolant.

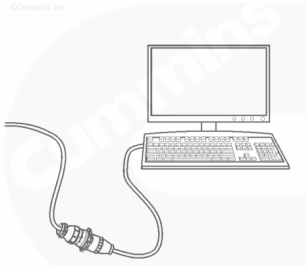
The temperatures achieved during regeneration are high enough to evaporate the coolant out of both components and return them to normal operating specifications.

Note : If these components are suspected of having coolant contamination, do **not** perform the Snap Acceleration Test before performing the regeneration.

Initial Check

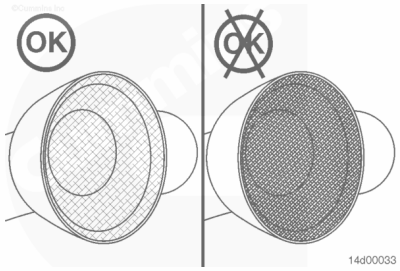
Use INSITE™ electronic service tool to check for fault codes. If **any** fault codes are present, follow the corresponding troubleshooting tree before performing **any** part of this procedure.

The fault code troubleshooting tree, in some cases, will refer back to this procedure to complete the diagnostics.



- Inspection of the exhaust system outlet can reveal the condition of the aftertreatment DPF. The exhaust system outlet should appear clean with little to no exhaust residue/soot buildup.

- The aftertreatment DPF is **not** 100 percent efficient. Some accumulation of exhaust residue/soot is normal and does **not** indicate a malfunctioning aftertreatment DPF.
- A heavy buildup of exhaust residue/soot can indicate a malfunctioning aftertreatment DPF.



To determine if the exhaust residue/soot accumulation on the exhaust system outlet is the result of a malfunctioning aftertreatment DPF, perform one of the following:

- Snap Acceleration Test. Refer to Procedure 014-017 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-017.html)
- Clean the last 152 to 254 mm [6 to 10 in] of the exhaust system outlet. Operate the vehicle for one shift or trip. Inspect the exhaust system outlet for exhaust residue/soot accumulation.
- Inspect the aftertreatment DPF. Refer to Procedure 011-041 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-041-tr.html)

Test

⚠WARNING⚠

During testing, exhaust gas temperature could reach 800°C [1500°F] and exhaust system surface temperature can exceed 700°C [1300°F], which is hot enough to ignite or melt common materials, and to burn people. The exhaust and exhaust components can remain hot after the vehicle stops moving. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

Note : If the stationary regeneration is being performed to recover either the DOC or DPF, or both, after coolant contamination, the DOC does **not** need to be removed or inspected unless there are active faults that require inspection as part of the fault code troubleshooting steps.

Note : Unless there are complaints of black smoke during operation and the exhaust stack is black, the DPF does **not** need to be removed or inspected during this process.

Before performing stationary regeneration, follow the steps listed below:

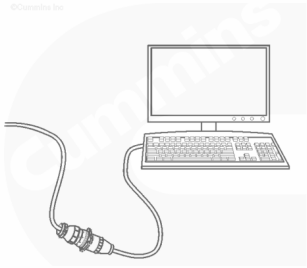
BURDLU ISUZU SALES

1. Select an appropriate location to park the vehicle.
    a. On a surface that will **not** burn or melt under high temperatures (such as clean concrete or gravel, **not** grass or asphalt)
    b. Away from anything that can burn, melt, or explode
        - Nothing within 0.6 m [2 ft] of the exhaust outlet
        - Nothing that can burn, melt, or explode within 1.5 m [5 ft] (such as gasoline, wood, paper, plastics, fabric, compressed gas containers, and hydraulic lines)
            - No gas or vapors nearby that could burn, explode, or contribute to a fire (such as liquid petroleum gas, gasoline vapors, oxygen, and nitrous oxide).
2. Park the truck securely.
    a. Set the parking brake.
    b. Place the transmission in Park, if provided. Otherwise, place the transmission in Neutral.
    c. Set the wheel chocks at the front and rear of at least one tire.
3. Set up a safe exhaust area.
    a. If bystanders can possibly enter the area, use barriers to keep people at least 1.5 m [5 ft] from the exhaust outlet during regeneration.
    b. When indoors, attach an exhaust discharge pipe rated for at least 800°C [1500°F].
    c. Keep a fire extinguisher nearby.
4. Check exhaust system surfaces.
    a. Confirm nothing is on or near the exhaust system surfaces (such as tools, rags, grease, or debris).
5. Prepare for engine speed changes during regeneration.
    a. Do **not** operate **any** power takeoff (PTO)-powered devices. Disconnect these devices before starting regeneration.
    b. Stay clear of the engine compartment.
6. Begin the stationary regeneration. This can be performed in two ways:
    a. A manual non-mission regeneration switch can be found on the equipment. The manual non-mission regeneration switch can be a stand-alone switch, or it can be combined with a diagnostic switch, at the discretion of the vehicle manufacturer.
    b. INSITE™ electronic service tool can be used to perform regeneration by starting the Aftertreatment DPF Regeneration Test.
    c. In either case, the engine will create enough heat to regenerate the aftermarket DPF. Engine speed will increase and the turbocharger can whistle loudly during the regeneration process. Once the aftermarket DPF is regenerated, the engine will automatically return to normal idle speed.
    d. Make sure the vehicle and surrounding area is monitored during regeneration. If **any** unsafe condition occurs, shut the engine off immediately.
7. Monitor the area.
    a. Make sure the vehicle and surrounding area is monitored during regeneration. If **any** unsafe condition occurs, shut the engine OFF immediately.

To stop a stationary regeneration, engage the clutch, brake, or throttle pedal; or turn off the engine.

Once regeneration is complete, exhaust gas and exhaust surface temperatures will remain elevated for 3 to 5 minutes.

The test can be found under the ECM Diagnostics Test menu in INSITE™ electronic service tool. Follow the on-screen instructions to perform the test.

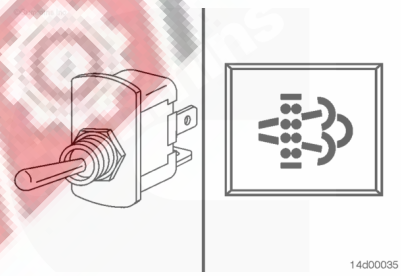


19r00163

To stop the stationary regeneration test at **any** time during the test:

1. Select the stop button on the INSITE™ electronic service tool monitor screen.
2. Depress the clutch, if equipped.
3. Depress the brake.
4. Depress the accelerator pedal.
5. Turn the engine off.

Note : If INSITE™ electronic service tool is **not** available, some vehicles can be equipped with an OEM-provided stationary regeneration method. The most common type is a stationary regeneration switch in the cab. The stationary regeneration switch can be a stand-alone switch, or can be combined with the diagnostic switch, at the discretion of the vehicle manufacturer.



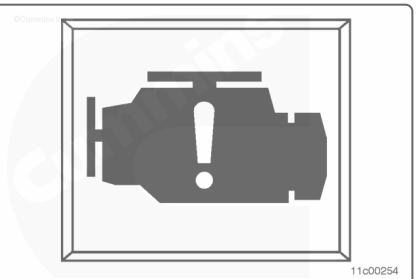
14d00035

OEM stationary regeneration initiations vary. See equipment manufacturer service information for specific instructions.

In order for the stationary regeneration switch to function, the stationary regeneration switch parameter **must** be enabled in the ECM.

Unlike the Aftertreatment Stationary Regeneration Test with INSITE™ electronic service tool, this switch will **only** start a stationary regeneration if the soot load of the filter is high enough. This is indicated by an illuminated or flashing aftertreatment lamp.

If the red STOP ENGINE indicator lamp is illuminated and an active Fault Code 1922 is present, indicating the aftertreatment DPF soot load is at the most severe level, the Aftertreatment DPF Regeneration Test should **not** be performed.



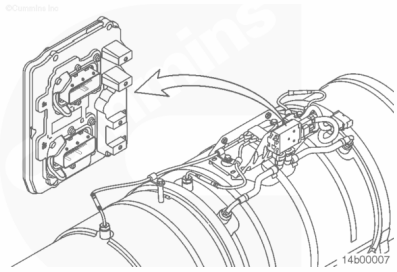
11c00254

The aftertreatment DPF **must** be inspected. Refer to Procedure 011-041 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-041-tr.html)

After the aftertreatment DPF is cleaned or replaced, the troubleshooting tree associated with the red STOP ENGINE lamp **must** be followed to reset the soot load value stored in

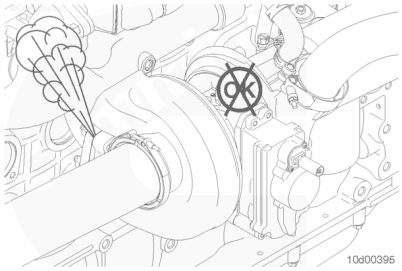
the ECM.

During the Aftertreatment DPF Regeneration Test, the following will be monitored:



- Aftertreatment Injector Status: Informs the user when fuel is being injected, in a small quantity, into the exhaust system upstream of the DOC.
- Aftertreatment DPF Soot Load: Informs the user of the current soot load of the filter:
- Normal: No regeneration is necessary.
- Above Normal: Least Severe Level - A stationary regeneration can be performed.
- Above Normal: Moderately Severe Level - A stationary regeneration can be performed.
- Above Normal: Most Severe Level - A stationary regeneration should **not** be performed unless the filter is cleaned or a new filter has been installed and the troubleshooting steps indicate it should be performed.
- Aftertreatment DPF Outlet Temperature
- Aftertreatment DPF Inlet Temperature
- Aftertreatment DOC Inlet Temperature.

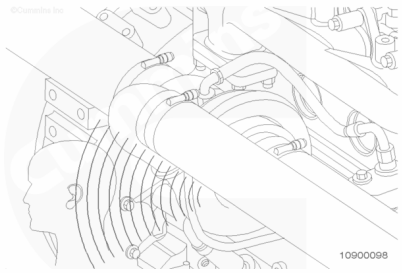
Before starting the Aftertreatment DPF Regeneration Test, inspect the exhaust piping for leaks, cracks, and loose connections. Refer to Procedure 010-024 in Section 10. (/qs3/pubsys2/xml/en/procedures/425/425-010-024.html)



Tighten the exhaust clamps, if necessary. See equipment manufacturer service information for the correct torque value.

Any leaks in the exhaust system will cause the Aftertreatment DPF Test to be less efficient in reducing the soot load of the filter. This will result in the test running longer and possibly **not** completing.

Note : If the Aftertreatment DPF Regeneration Test will **not** initiate, see the Stationary Regeneration - Will Not Activate troubleshooting symptom tree in Section TS.

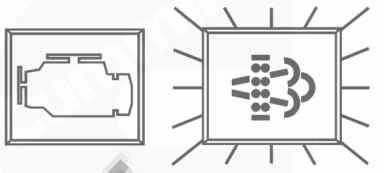


Once the Aftertreatment DPF Regeneration Test is started, follow INSITE™ electronic service tool on-screen instructions. When the test is started, engine idle speed will be raised automatically to the required level.

The engine will, through engine controls, operate in a manner to build exhaust heat. The turbocharger will emit a slight whining noise during this test. This is normal.

Once the Aftertreatment DPF Regeneration Test is complete, the engine will automatically return to normal idle speed.

Once the test is complete, check for active fault codes and/or engine indicator lamps for high aftertreatment diesel particulate soot load after performing the Aftertreatment DPF Regeneration Test. If **any** active fault codes are present, follow the appropriate fault code troubleshooting tree.



ANADOLU ISUZU AFTER SALES

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

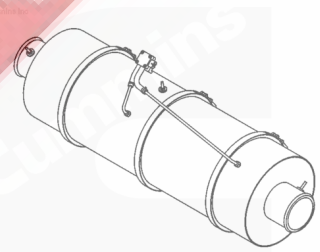
Additional Service Items

- No additional service items required.

General Information

Use the following procedure for additional information on the aftertreatment system. Refer to Procedure 011-999 in Section F. (/qs3/pubsys2/xml/en/procedures/425/425-011-999.html)

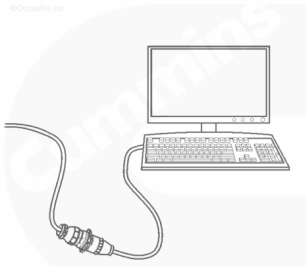
The following procedure contains information about how to perform a Snap Acceleration Test with the aftertreatment system connected and disconnected.



Initial Check

Use INSITE™ electronic service tool to check for fault codes. If **any** fault codes are present, follow the corresponding troubleshooting tree before performing **any** part of this procedure.

The fault code troubleshooting tree, in some cases, will refer back to this procedure to complete the diagnostics.

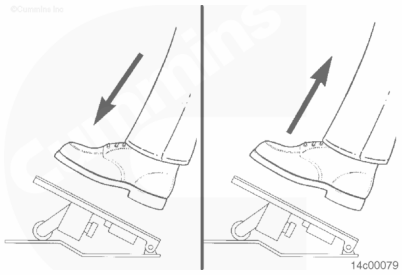


Test

Snap Acceleration - Aftertreatment Connected

ANADOLU SUZU DEALER SALES

Monitoring the condition of the exhaust leaving the exhaust system outlet during a snap acceleration can reveal the condition of the aftertreatment diesel particulate filter (DPF).



The engine **must** be at minimum operating temperature or above when completing this test. The vehicle transmission **must** be in neutral and the vehicle parking brake **must** be applied.

Start and idle the engine. Rapidly depress the accelerator pedal from 0 to 100 percent. This can be performed multiple times, if necessary.

During this test, check for black smoke exiting the exhaust stack, as the engine is accelerated from low idle to high idle.

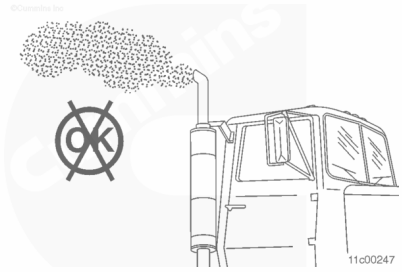
Note : In some applications, a Snap Acceleration Test may **not** provide the conditions necessary to reveal a malfunctioning aftertreatment DPF. If there is a heavy buildup of exhaust residue/soot on the exhaust system outlet and a snap acceleration does not reveal a condition outlined in the following steps, it can be necessary to perform a brief acceleration run under partial to full load and/or a stall test. Refer to Procedure 014-008 in Section 14. (/qs3/pubsys2/xml/en/procedures/425/425-014-008.html)

Note : If an opacity meter is used to measure the condition of the exhaust gas leaving the exhaust system outlet, the engine and aftertreatment system **must** be at operating temperature.

White smoke can indicate condensation in the exhaust and/or some unburned fuel. White smoke is **not** an indication of a malfunction of the aftertreatment system.

If excessive white smoke is present, see the Engine Performance troubleshooting symptom tree in Section TS.

Visible gray smoke or faint black smoke out of the exhaust system outlet indicates the aftertreatment DPF is damaged. Inspect the aftertreatment DPF. Refer to Procedure 011-041 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-041-tr.html)



Visible black smoke out of the exhaust system outlet indicates a malfunction of the aftertreatment DPF.

ANADOLU ISUZU PARTS SALES

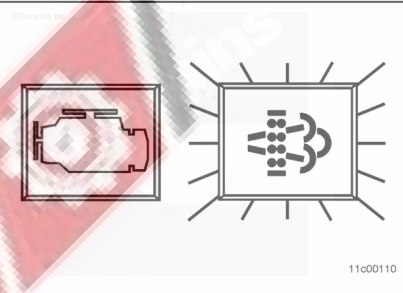
Note : If the vehicle has experienced the diesel particulate lamp illuminating frequently, high exhaust temperature lamp, if equipped, illuminating frequently, and/or requires frequent stationary regenerations, use the appropriate troubleshooting symptom tree in Section TS.

See the following service bulletin for pass or fail guidelines. Refer to Service Bulletin, Aftertreatment Diesel Oxidation Catalyst and Aftertreatment DPF Reuse Guidelines, Bulletin 4021600. (/qs3/pubsys2/xml/en/bulletin/4021600.html)

Snap Acceleration - Aftertreatment Disconnected

⚠ WARNING ⚠

The exhaust and exhaust components can remain hot after the engine has been shut down or secured. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they might come in contact with hot exhaust or exhaust components.



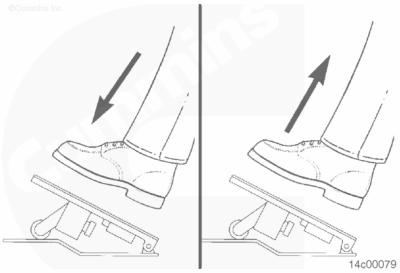
One of the functions of the aftertreatment system is to remove particulates from the exhaust gas. This function prevents the use of black smoke as a diagnostic symptom.

The Snap Acceleration Test (aftertreatment disconnected) is used to check for abnormally high amounts of black smoke in the exhaust gas.

Disconnect the exhaust pipe from the turbocharger turbine outlet.

The vehicle transmission **must** be in neutral.

The vehicle parking brake **must** be applied.

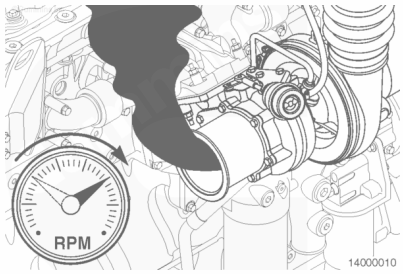


It can be necessary to temporarily adjust the maximum engine speed with no vehicle speed sensor (VSS) parameter in INSITE™ electronic service tool to the high idle speed of the engine.

Start the engine. Let it idle.

Quickly depress the accelerator pedal from 0 percent to 100 percent and hold for 5 seconds then release. This can be performed multiple times, if necessary.

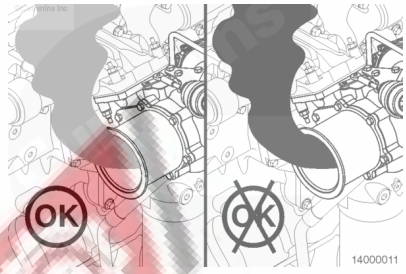
During this test, check for black smoke exiting the turbocharger turbine outlet as the engine is accelerated from low idle to high idle and at high idle.



A small puff of black smoke upon acceleration that clears at a steady high idle speed is normal.

White smoke during the Snap Acceleration Test does **not** indicate a malfunction. No repair is necessary.

Heavy black smoke indicates other upstream engine issues that need to be diagnosed. See the Black Smoke - Excessive troubleshooting symptom tree in Section TS.

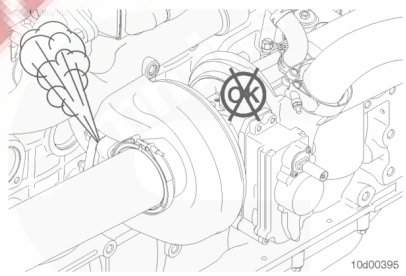


Reconnect the exhaust system.

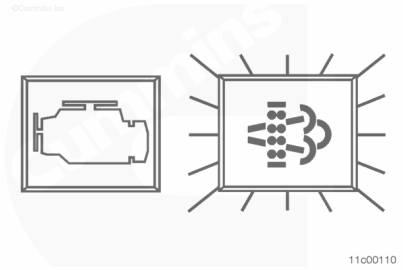
Inspect the exhaust piping for leaks, cracks, and loose connections.

Tighten the exhaust clamps if necessary.

See equipment manufacturer service information for the correct torque value.



Once the test is complete, check for active fault codes and/or engine indicator lamps for high aftertreatment diesel particulate soot load after performing the Aftertreatment DPF Regeneration Test. If **any** active fault codes are present, follow the appropriate fault code troubleshooting tree.



ANADOLU ISUZU
PARTS SALES

Last Modified: 05-Aug-2016

Select Service Tools

Recommended Cummins® Service Tools

- Leak Test Kit, Part Number 2892320
- Fluorescent dye additive for fuel and lubricating oil, Part Number 3376891
- Fluorescent dye additive for coolant, Part Number 3377438

Additional Service Items

- No additional service items required.

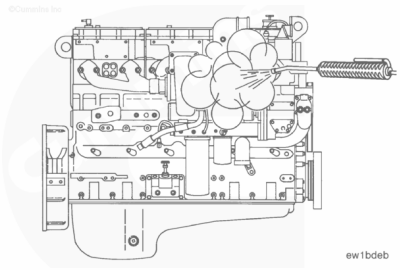
General Information

The Fluorescent Tracer Dye Test is used to aid in locating fluid leaks in the lubricating oil system, cooling system, and fuel system. The instructions and illustrations in this procedure are generic and do **not** cover component specific instructions. For component specific testing instructions, see the appropriate procedure in the corresponding Cummins® Service Manual or the equipment manufacturer service information.

Preparatory Steps

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.



⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.

⚠ WARNING ⚠

Some solvents are flammable and toxic. Read the manufacturer’s instructions before using.

⚠ CAUTION ⚠

Protect all electrical components, openings, and wiring from the full force of the cleaner spray nozzle.

Some rust prevention oils applied at the factory have fluorescent dyes, which can provide false test results. Check suspect areas with a black light to make sure there is not already fluorescent dye present before adding fluorescent dyes to the fluid under test.

Steam clean the affected areas on the engine.

If steam is not available, use an appropriate solvent to clean the engine.

Setup

Initial Setup

See the corresponding Cummins® Service Manual or the equipment manufacturer service information to determine the total volume of the fluid system being tested. Select the appropriate fluorescent dye additive for the fluid system being tested.

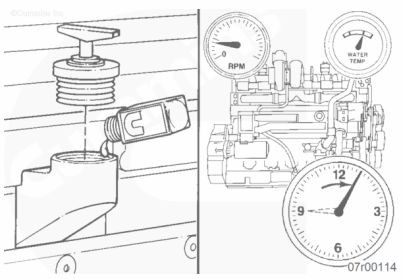
- For lubricating oil or fuel use fluorescent dye additive, Part Number 3376891.
- For coolant use fluorescent dye additive, Part Number 3377438.

Determine the amount of fluorescent dye additive required for the fluid system being tested. Use the instructions provided with the fluorescent dye additive being used.

Lubricating Oil

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.



⚠ WARNING ⚠

Some state and federal agencies have determined that used engine oil can be carcinogenic and cause reproductive toxicity. Avoid inhalation of vapors,

ANADOLU ISUZU USED SALES

ingestion, and prolonged contact with used engine oil. If not reused, dispose of in accordance with local environmental regulations.

Remove the lubricating oil fill cap and add the appropriate amount of fluorescent dye additive to the lubricating oil system. Install the lubricating oil fill cap.

Note : Lubricating oil with high levels of soot may need to be changed in order to make the fluorescent dye visible. Up to three times the standard amount of fluorescent dye additive may be used if necessary. The use of fluorescent dye additive does **not** interfere with engine performance and can be left in the lubricating oil after use.

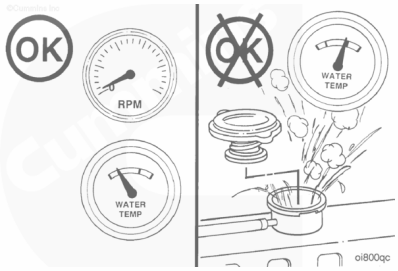
Operate the engine in a manner to distribute the fluorescent dye additive throughout the lubricating oil system evenly. This can typically be achieved by operating the engine at high idle for approximately five minutes.

For engine or equipment specific test procedures, see the corresponding Cummins® Service Manual or the equipment manufacturer's service information.

Coolant

⚠ WARNING ⚠

Do not remove the pressure cap from a hot engine. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Heated coolant spray or steam can cause personal injury.



⚠ WARNING ⚠

Coolant is toxic. Keep away from children and pets. If not reused, dispose of in accordance with local environmental regulations.

⚠ WARNING ⚠

The coolant line(s) can be hot and under pressure. Do not disconnect the coolant lines while the engine is running or before the system has cooled down after engine shutdown. Heated coolant spray can cause personal injury. To reduce the possibility of personal injury, use eye and face protection, gloves and appropriate personal protective equipment.

ANADOLU ISUZU PARTS SALES

Verify the coolant temperature is below 50°C [120°F]. Remove the radiator cap.

Add the appropriate amount of fluorescent dye additive to the cooling system.

Install the radiator cap.

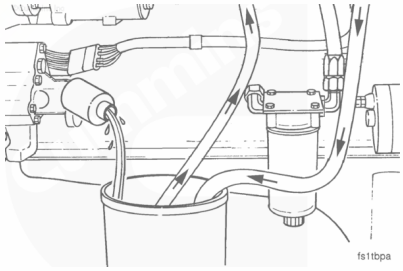
Operate the engine in a manner to evenly distribute the fluorescent dye additive throughout the cooling system. Raise coolant temperature until coolant thermostats are open. This can typically be achieved by operating the engine at high idle while monitoring engine coolant temperature. Operate engine for an additional ten minutes after coolant thermostats have opened.

For coolant thermostat opening temperatures, see corresponding Cummins® Service Manual or equipment manufacturer service information.

Fuel

⚠ WARNING ⚠

Fuel can be returned at highly elevated temperatures. Wear safety glasses and protective gloves and clothing when performing this test. Avoid any contact with returned fuel.



⚠ WARNING ⚠

Fuel is flammable. Keep all cigarettes, flames, pilot lights, arcing equipment, and switches out of the work area and areas sharing ventilation to reduce the possibility of severe personal injury or death when working on the fuel system.

Note : This section **only** applies to engines operating on diesel fuel.

Test method when operating engine from equipment fuel reservoir:

Remove fuel fill cap and add appropriate amount of fluorescent dye additive to fuel tank. Install fuel fill cap.

Operate equipment to evenly distribute fluorescent dye additive in fuel system.

Test method when operating engine from a temporary fuel reservoir:

Fill a container suitable for fuel with clean diesel fuel. Add appropriate amount of fluorescent dye additive to container. Mix fuel and fluorescent dye additive for even distribution.

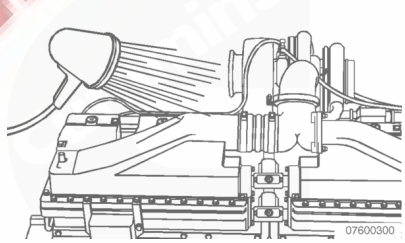
Disconnect fuel supply and return lines from engine. See appropriate procedures in corresponding Cummins® Service Manual. Fabricate temporary fuel lines to connect from temporary fuel reservoir to engine fuel inlet and return ports.

Operate equipment to evenly distribute fluorescent dye additive in fuel system.

Test

⚠ WARNING ⚠

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin.



⚠ WARNING ⚠

To reduce the possibility of personal injury, keep hands, long hair, jewelry, and loose-fitting or torn clothing away from fans and other moving parts.

Inspect area of suspected leak for presence of fluorescent dye. Use the black light from leak test kit, Part Number 2892320.

Operation of the engine may be necessary during the inspection process to determine the origin of the leak.

Always start at the bottom of the engine or component being inspected and work toward the top. Liquids will flow to the lowest point before forming droplets. Follow the fluorescent dye trail upward to determine the origin of the leak. If a leak is suspected in a given area, verify the fluorescent dye trail does **not** originate from a location above.

Components like the cooling fan may create air flow that will distribute the fluorescent dye in a horizontal direction. In these cases, follow the fluorescent dye trail in the opposite direction of flow to find the origin of the leak.

Rotating components like the flywheel or vibration damper, will distribute fluorescent dye in a circular pattern. For this situation, determine if the fluorescent dye is being dripped on the component from above and being redistributed, or if the leak originates at the seal near the center of the component.

Repair or replace the component or components that the fluorescent dye originates from.

If the origin of the fluorescent dye can **not** be found, consider cleaning the engine or component and test again.

If fluorescent dye is **not** found during the inspection, no leak is present.

Finishing Steps

Install any components that were removed for access during the test.

To verify repair:

- Operate equipment in same manner used to generate leak(s).
- Check for leaks.

ANADOLU ISUZU AFTER SALES

Last Modified: 23-Jul-2019

Select Service Tools

Recommended Cummins® Service Tools

- Recommended Cummins® electronic service tool or equivalent

Additional Service Items

- No additional service items required.

General Information

The Aftertreatment Selective Catalytic Reduction System Test is a diagnostic used to identify malfunctioning aftertreatment SCR system components. The test is located in the recommended Cummins® electronic service tool or equivalent under the diagnostic tests tab.

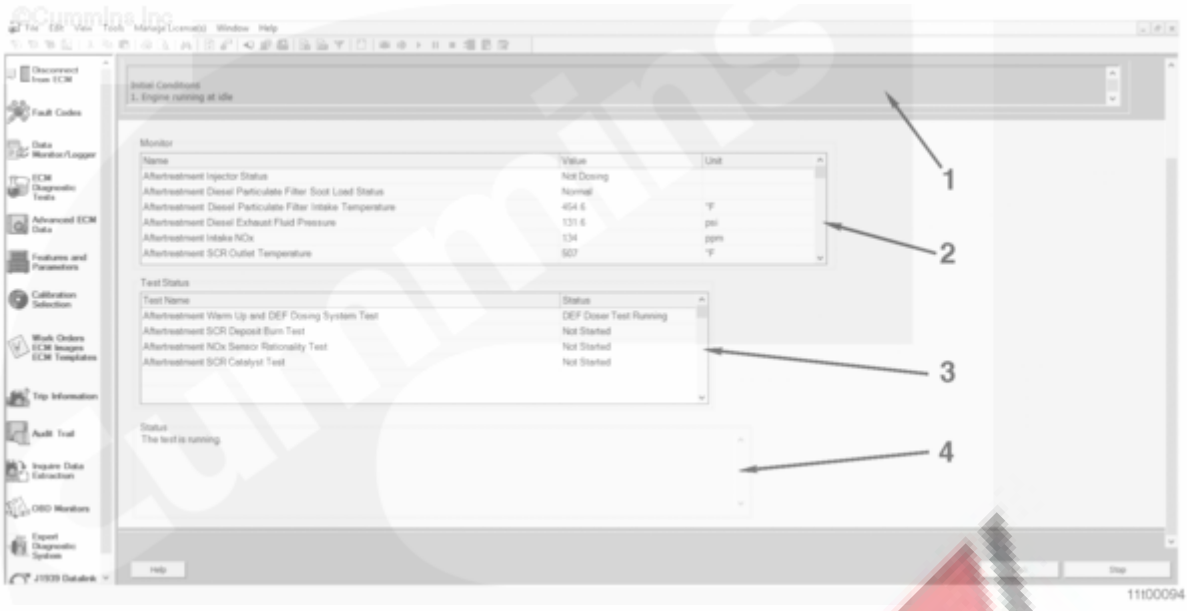
The test consists of the following subtests.

- Aftertreatment Warm-Up and Diesel Exhaust Fluid (DEF) Dosing System Test
- Aftertreatment SCR Deposit Burn Test
- Aftertreatment Nitrogen Oxides (NOx) Sensor Rationality Test
- Aftertreatment SCR Catalyst Test.

The SCR system test will display the status of each of the subtests in the subtest status window.

The SCR system test will take approximately 60 to 80 minutes to complete.

ANADOLU ISUZU AFTER SALES

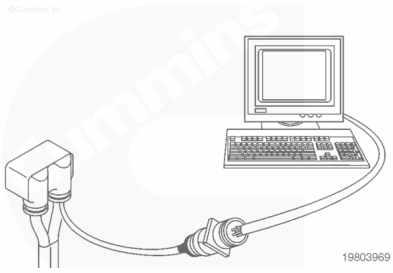


Aftertreatment SCR System Test Screen (INSITE™ electronic service tool)

1. Test Instruction Window
2. Monitor Parameter Window
3. Subtest Status Window
4. Main Status Window.

System Requirements

Check the engine control module (ECM) calibration revision history for calibration updates for this test. If the ECM does not contain that revision or higher, update the calibration. Refer to Procedure 019-032 in Section 19. (/qs3/pubsys2/xml/en/procedures/105/105-019-032.html)



The SCR system test should **only** be used when directed by a service procedure, fault code troubleshooting tree, symptom troubleshooting tree, or expert diagnostic system (EDS).

Preparatory Steps

⚠ WARNING ⚠

The test will produce significant engine noise due to the varying engine speeds that will occur during the test process. Do not perform this test in an enclosed environment. Move the equipment to a secluded location. To reduce the possibility of

personal injury, hearing protection must be used while conducting this test.

Connect the recommended Cummins® electronic service tool or equivalent and check for active fault codes. Troubleshoot any active fault codes prior to performing this test. Do **not** perform the SCR system test with active fault codes, unless guided to do so by the fault code troubleshooting.

Before performing the SCR system test, follow the steps listed below:

1. Perform initial inspection of the aftertreatment system.
   - Check for exhaust leaks.
2. Select an appropriate location to park the vehicle.
   - The SCR system test is an extremely noisy test
   - Move the vehicle to a secluded location, such as a back parking lot
   - It is **not** recommended to perform the SCR system test in the shop. If the test **must** be run indoors due to low ambient temperature, be sure the proper exhaust ventilation measures are taken and all personnel in the area are wearing hearing protection
   - Perform the test on a reasonably level surface.
3. Park the vehicle securely.
   - Set the parking brake. See equipment manufacturer instructions
   - Turn engine brakes OFF
   - Place the transmission in Park, if equipped; otherwise in Neutral
   - Set wheel chocks at the front and rear of at least one tire.
4. Set up a safe area.
   - If bystanders might enter the area, set up barriers to keep them at least 1.5 m [5 ft] from the front and rear of the vehicle during the SCR system test.
   - Make certain that the cab and sleeper are clear of occupants.
   - Keep a fire extinguisher nearby.
5. Prepare for engine speed changes during the SCR system test.
   - Do **not** operate any power takeoff (PTO) powered devices. Disconnect or disable these devices before starting the SCR system test
   - Stay clear of the engine compartment.
6. Start a datalog with the recommended Cummins® electronic service tool or equivalent.
   - Log all parameters in the data monitor/logger screen.

Test

Note : If the connection between the recommended Cummins® electronic service tool or equivalent and the ECM is lost for any reason, a pop-up message will

appear. When this occurs, the test will automatically abort. The test can be restarted after cycling the keyswitch OFF for 90 seconds and then back ON.

Note : After each run of the SCR system test, a key cycle is required, allowing the ECM to completely power down (90 seconds) before the test can be rerun.

1. Begin the SCR system test.

- Use the recommended Cummins® electronic service tool or equivalent to perform the SCR system test
- Engine speed will increase to a specified value and then the ECM will perform the analysis process
- At the conclusion of the test, the engine will return to idle and the SCR system test will display either pass or fail status for all systems tested.

2. Monitor the area.

- Make sure that the vehicle and surrounding area are monitored during the SCR system test. If any unsafe condition occurs, shut the engine OFF immediately.

To stop the SCR system test click the STOP button on the test screen. The SCR system test can also be stopped by engaging the clutch, brake, or throttle pedal; or by turning the engine OFF.

When the test is started, engine speed will vary from 950 revolutions per minute (rpm) up to 1700 rpm during the different stages of the test.

Test progress can be monitored using the subtest status window.

Test results will be displayed as each subtest completes. The test will stop if a subtest makes a decision other than PASS and repair action is required.

Once the SCR system test is complete, the engine will automatically return to normal idle speed. The SCR system test will display the test results for review until the next key cycle.

After the test has completed stop the recommended Cummins® electronic service tool or equivalent datalog.

For information on repair action based on subtest results, see the analyzing the Data section of this procedure. Record the subtest results for later reference.

The SCR system test will **not** start if:

- Another diagnostic test is running
- Aftertreatment diesel particulate filter (DPF) regeneration is active
- DEF tank level is low
- Ambient temperature is too low
- Barometric pressure is too low
- DEF system is frozen.

The SCR system test will **not** start or will be aborted if:

- Coolant temperature too low after the warmup period
- Accelerator pedal is depressed
- Clutch pedal is depressed
- Brake pedal is depressed

- Parking brake **not** set
- Transmission is put into gear
- PTO engaged
- Vehicle speed detected
- Engine brake switch is ON
- Engine protection state active
- A regeneration inhibiting fault becomes active
- High aftertreatment temperature faults become active.

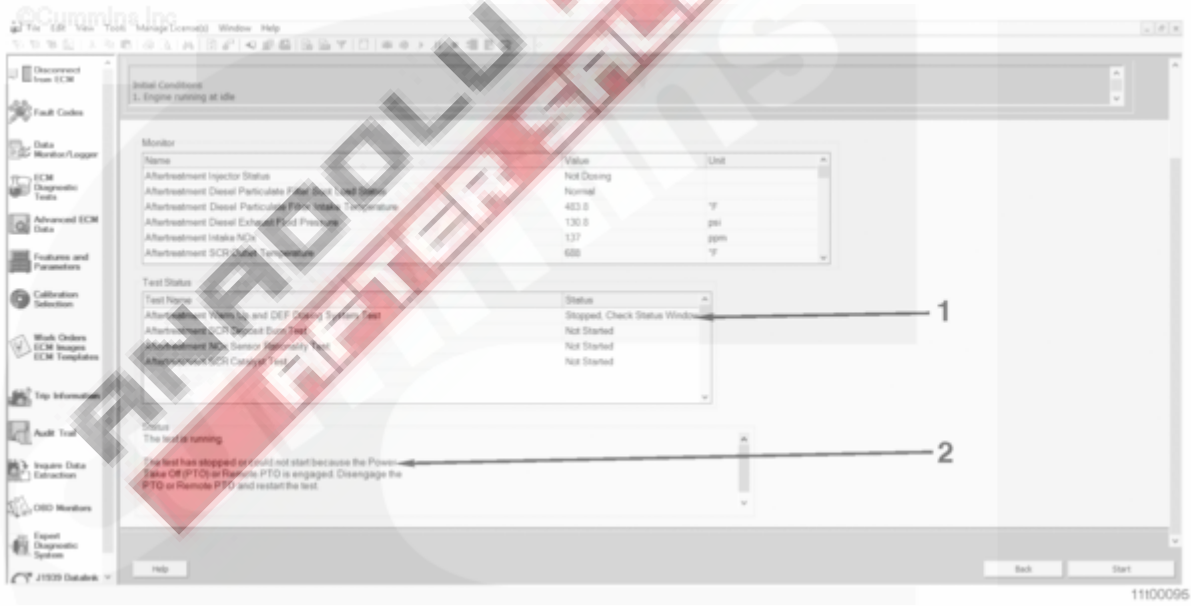
If the SCR system test aborts or will **not** activate, a message will be displayed. Correct the issue identified before proceeding. For more information on abort messages and associated repair action, see the Troubleshooting section of this procedure.

Troubleshooting

General Information

This section is used to assist troubleshooting abort messages from the Main Status Window.

INSITE™ Eletronic Service Tool



1. The “Stopped, Check Status Window” message will be displayed by the subtest that was running when the abort occurred. All other subtests will retain their current messages until a key cycle.
2. Abort Message in Main Status Window. The most recent message will appear at the bottom.

Some messages were modified between INSITE™ electronic service tool version 8.1.1 and INSITE™ electronic service tool version 8.1.2 and later. Use the appropriate table below for the version of INSITE™ electronic service tool being used.

ANADOLU ISUZU AFTER SALES

INSITE™ 8.1.1 Status Messages

Main Status Message	Action
The test has stopped.	None
The test is running.	None
The number of allowed attempts for this key cycle has been reached. Key OFF, allow the ECM to completely power down, key ON, and restart the test.	Cycle the keyswitch and restart the test.
The ECM has detected a condition in which it will not allow the Aftertreatment SCR System test to run.	The ECM is prohibiting the test from running. • Follow the appropriate technical escalation process.
The test has completed. Please cycle the keyswitch and restart the engine to restart the test.	If all the subtests have passed, the test is complete. If a subtest has failed, see the subtest message in the “Analyzing the Data” section in this procedure.
The test has stopped or could not start because the parking brake is not engaged. Exit the test, correct the issue and restart the test.	• Verify that the parking brake is set. See equipment manufacturer service information. • Review features and parameters using INSITE™ electronic service tool. The parking brake switch is defaulted to Enable. If the parking brake status is **not** transmitted to the ECM this parameter should be set to Disabled for the SCR System Test to run properly. • Check the parking brake switch and circuit.
The test has stopped or could not start because the accelerator pedal or throttle position is greater than zero. Be sure the accelerator pedal or throttle is released and restart the test.	• Verify the engine brake is OFF. • Check for foot pedal restriction. • Check the accelerator pedal or lever position sensor and circuit. Refer to Procedure 019-085 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-085.html).
The test has stopped or could not start because the transmission is in gear or a command on the data link is preventing the test. Place the transmission in Park or Neutral and restart the test.	• Verify that the transmission is in Park, if applicable, otherwise in Neutral. See equipment manufacturer service information.

ANADOLU ISUZU AFTER SALES

Main Status Message	Action
The test has stopped or could not start because the Power Take Off (PTO) or Remote PTO is engaged. Disengage the PTO or Remote PTO and restart the test.	• Verify the PTO is disengaged. • Check the Cruise Control/PTO selector switch and circuit. Refer to Procedure 019-021 in Section 19. (/qs3/pubsys2/xml/en/procedures/99/99-019-021.html) Refer to Procedure 019-022 in Section 19. (/qs3/pubsys2/xml/en/procedures/99/99-019-022.html)
The test has stopped or could not start because the original equipment manufacturer (OEM) sensor ambient conditions are out of range. Check the OEM ambient sensor values and be sure they are in normal operating range, cycle the keyswitch, and restart the test.	The status of one or both of the nitrogen oxides (NOx) sensors is continuously invalid. • Check for active NOx sensor fault codes. • Be sure the NOx sensors are reaching initializing temperature, above 200°C [392°F]. Use INSITE™ electronic service tool to monitor exhaust gas temperature. • Restart the test. • If the error message persists, follow the appropriate technical escalation process.
The test has stopped or could not start because the vehicle is moving or a vehicle speed sensor fault code is active. Stop the vehicle, verify no vehicle speed sensor fault codes are active, cycle the keyswitch, and restart the test.	• Be sure the vehicle is **not** moving and is properly secured. • Troubleshoot any active vehicle speed sensor faults. • Check that the vehicle speed sensor is **not** loose. • Check the vehicle speed sensor for poor grounding or electrical interference.
The test has stopped or could not start because a command on the data link is preventing the test. Check all the devices on the data link, troubleshoot any active fault codes, cycle the keyswitch, and restart the test.	The anti-lock braking system (ABS) module is sending a data link message to disable the engine brake. This message is causing the ECM to abort the test. • Be sure the engine brake is turned OFF. • Troubleshoot any fault codes from the ABS module.
The test has stopped or could not start because of an EGR or turbocharger issue. Troubleshoot any active fault codes, cycle the keyswitch, and restart the test.	• Troubleshoot any active turbocharger or exhaust gas recirculation (EGR) fault codes.

ANADOLU ISUZU GUNCEL SATIS

Main Status Message	Action
The test has stopped or could not start because the current engine operating state is hindering the test. Determine the engine state, correct any issues, cycle the keyswitch, and restart the test.	Another component or feature is taking control of engine speed. • Check that OEM or customer-selected inhibit features are **not** active. • Check that programmable parameters or selected features are correct. Refer to Procedure 019-078 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-078.html). Also refer to the service bulletin Multiplexing Troubleshooting, Bulletin 4021378 (/qs3/pubsys2/xml/en/bulletin/4021378.html). • Check that the vehicle speed sensor is **not** loose • Check the vehicle speed sensor for poor grounding or electrical interference.
The test has stopped or could not start because an Engine Protection derate is active. Troubleshoot any active fault codes, cycle the keyswitch, and restart the test.	• Troubleshoot active fault codes.
The test has stopped or could not start because the clutch or service brake is depressed. Release the clutch or service brake pedal and restart the test.	• Check the clutch switch adjustment, switch, and circuit. Refer to Procedure 019-009 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-009.html). Refer to Procedure 019-010 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-010.html). • Check the vehicle brake switch and the circuit. Refer to Procedure 019-088 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-088.html). Refer to Procedure 019-089 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-089.html).
The test has stopped or could not start because the engine coolant temperature is too low. Continue to run the engine to raise the coolant temperature, cycle the keyswitch, and restart the test.	The coolant temperature warm-up period has timed out. • Cycle the keyswitch and restart the test.

ANADOLU ISUZU DEALER

Main Status Message	Action
The test has stopped because the exhaust volumetric flow rate is out of range.	The ECM detected the exhaust flow rate estimate is out of range. • Troubleshoot active engine fault codes. • Perform the following checks in the Engine Performance Troubleshooting Tree in Section TT. • Step 6 - EGR system checks. • Step 5 - Air handling checks.
The test has stopped because the barometric air pressure or OEM ambient air temperature is low.	Move the vehicle to a warmer location or lower altitude.
The aftertreatment DPF regeneration has timed out. Cycle the keyswitch and select Start to restart the test.	Cycle the keyswitch and restart the test.
The ECM has detected a fault condition. Check for active faults, troubleshoot fault codes, key OFF, allow the ECM to completely power down, key ON, and restart the test.	An active fault code is preventing the test from running. Troubleshoot active fault codes.
The test has stopped because the test engine speed is out of the expected range.	This message indicates engine speed was higher or lower than the commanded value. If engine speed is low: • Troubleshoot the engine for low power or the inability to reach rated speed. See Section TT. If engine speed is high: • Troubleshoot the engine for surges at low or high idle or surges under load. See Section TT.

ANADOLU ISUZU AFTER SALES

Main Status Message	Action
The test has stopped because the DPF outlet temperature is out of the expected range.	This message indicates the DPF outlet temperature is above the maximum or below the minimum temperature during the test. If DPF outlet temperature is too high a fault code will be set. • Troubleshoot the active fault code. If DPF outlet temperature is too low: • Refer to the “Stationary Regeneration - Will Not Complete” symptom tree found in Section TS of this manual. Do **not** refer to the “Stationary Regeneration - Will Not Activate” TS tree. All the conditions/malfunctions in the “Stationary Regeneration - Will Not Activate” TS tree have specific messages in this test.
The test has stopped or could not start because the DEF tank level is low. Fill the tank to the proper level and restart the test.	• Fill the DEF tank.
The test could not start because the DEF in the tank may be frozen or is too cold to dose. Raise the tank temperature prior to restarting the test.	• Troubleshoot any active faults or malfunctioning DEF system heating components. • Allow the DEF system to thaw.
The test has stopped because the NOx levels could not be modulated.	Another component or feature is taking control of engine speed and preventing the test from modulating NOx to the desired level. • Check that OEM or customer-selected inhibit features are **not** active. • Check that programmable parameters or selected features are correct. Refer to Procedure 019-078 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-078.html). Also refer to the service bulletin Multiplexing Troubleshooting, Bulletin 4021378 (/qs3/pubsys2/xml/en/bulletin/4021378.html). • Check that the vehicle speed sensor is **not** loose. • Check the vehicle speed sensor for poor grounding or electrical interference.

INSITE™ 8.1.2 and Later Status Messages

Main Status Message	Action
The test has stopped.	None
The test is running.	None
Test did not start because a key cycle is needed. Key cycle and restart test.	Cycle the keyswitch and restart the test.
The ECM has detected a condition in which it will not allow the Aftertreatment SCR System test to run.	The ECM is prohibiting the test from running. • Follow the appropriate technical escalation process.
The test has completed. Please cycle the keyswitch and restart the engine to restart the test.	If all the subtests have passed, the test is complete. If a subtest has failed, refer to the subtest message in the “Analyzing the Data” section in this procedure.
The test has stopped or could not start because the parking brake is not engaged. Exit the test, correct the issue and restart the test.	• Verify that the parking brake is set. See equipment manufacturer service information. • Review features and parameters using INSITE™ electronic service tool. The parking brake switch is defaulted to Enable. If the parking brake status is **not** transmitted to the ECM, this parameter should be set to Disabled for the SCR system test to run properly. • Check the parking brake switch and circuit.
The test has stopped or could not start because the accelerator pedal or throttle position is greater than zero. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	• Verify the engine brake is OFF. • Check for foot pedal restriction. • Check the accelerator pedal or lever position sensor and circuit. Refer to Procedure 019-085 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-085.html).
The test has stopped or could not start because the Transmission is in gear or a command on the data link is preventing the test. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	• Verify that the transmission is in Park, if applicable, otherwise in Neutral. See equipment manufacturer service information.

ANADOLU ISUZU AFTER SALES

Main Status Message	Action
The test has stopped or could not start because the (PTO) or Remote PTO is engaged. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	• Verify the PTO is disengaged. • Check the Cruise Control/PTO selector switch and circuit. Refer to Procedure 019-021 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-021.html). Refer to Procedure 019-022 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-022.html).
The status of one or both of the NOx sensors is continuously invalid. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	The status of one or both of the NOx sensors is continuously invalid. • Check for active NOx sensor fault codes. • Be sure the NOx sensors are reaching initializing temperature, above 200°C [392°F]. Use INSITE™ electronic service tool to monitor exhaust gas temperature. • Restart the test. • If the error message persists, follow the appropriate technical escalation process.
The test has stopped or could not start because the vehicle is moving or a vehicle speed sensor fault code is active. Correct the issue, key off, allow the ECM to completely power down, key ON, and restart the test.	• Be sure the vehicle is **not** moving and is properly secured. • Troubleshoot any active vehicle speed sensor faults. • Check that the vehicle speed sensor is **not** loose. • Check the vehicle speed sensor for poor grounding or electrical interference.
The test has stopped or could not start because an engine brake disable request was received on the data link. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	The ABS module is sending a data link message to disable the engine brake. This message is causing the ECM to abort the test. • Be sure the engine brake is turned OFF. • Troubleshoot any fault codes from the ABS module.

ANADOLU ISUZU GUC SATIS

Main Status Message	Action
The test has stopped or could not start because of an EGR or turbocharger issue. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	• Troubleshoot any active turbocharger or EGR fault codes.
The test has stopped or could not start because another feature is controlling the engine speed. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	Another component or feature is taking control of engine speed. • Check that OEM or customer-selected inhibit features are **not** active. • Check that programmable parameters or selected features are correct. Refer to Procedure 019-078 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-078.html). Also refer to the service bulletin Multiplexing Troubleshooting, Bulletin 4021378 (/qs3/pubsys2/xml/en/bulletin/4021378.html). • Check that the vehicle speed sensor is **not** loose. • Check the vehicle speed sensor for poor grounding or electrical interference.
The test has stopped or could not start because an Engine Protection derate is active. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	• Troubleshoot active fault codes.
The test has stopped or could not start because the clutch or service brake is depressed. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	• Check the clutch switch adjustment, switch, and circuit. Refer to Procedure 019-009 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-009.html). Refer to Procedure 019-010 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-010.html). • Check the vehicle brake switch and the circuit. Refer to Procedure 019-088 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-088.html). Refer to Procedure 019-089 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-089.html).

ANADOLU ISUZU AFTER SALES

Main Status Message	Action
The test has stopped or could not start because the engine coolant temperature is too low. Key OFF, allow the ECM to completely power down, key ON, and restart the test.	The coolant temperature warm-up period has timed out. • Cycle the keyswitch and restart the test.
The test has stopped because the exhaust flow rate is out of range. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	The ECM detected the exhaust flow rate estimate is out of range. • Troubleshoot active engine fault codes. • Perform the following checks in the Engine Performance Troubleshooting Tree. See Section TT. • Step 6 - EGR system checks. • Step 5 - Air handling checks.
The test has stopped because the barometric air pressure or ambient air temperature is low. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	Move the vehicle to a warmer location or lower altitude.
The aftertreatment DPF regeneration has timed out. Key OFF, allow the ECM to completely power down, key ON, and restart the test.	Cycle the key, Restart the test.
The ECM has detected a fault condition. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	An active fault code is preventing the test from running. Troubleshoot active fault codes.
The test has stopped because engine speed is out of the desired range. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	This message indicates engine speed was higher or lower than the commanded value. If engine speed is low: • Troubleshoot the engine for low power or the inability to reach rated speed. See Section TT. If engine speed is high: • Troubleshoot the engine for surges at low or high idle or surges under load. See Section TT.

ANADOLU ISUZU PARTS SALES

Main Status Message	Action
The test has stopped because the DPF outlet temperature is out of the desired range. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	This message indicates the DPF outlet temperature is above the maximum or below the minimum temperature during the test. If DPF outlet temperature is too high, a fault code will be set. • Troubleshoot the active fault code. If DPF outlet temperature is too low: • See the “Stationary Regeneration - Will Not Complete” symptom tree found in section TS of this manual. Do **not** reference the “Stationary Regeneration - Will Not Activate” TS tree. All the conditions/malfunctions in the “Stationary Regeneration - Will Not Activate” TS tree have specific messages in this test.
DEF tank level is too low. Fill tank with DEF, cycle key and restart test	• Fill the DEF tank.
The test could not start because the DEF in the tank may be frozen or is too cold to dose. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	• Troubleshoot any active faults or malfunctioning DEF system heating components. • Allow the DEF system to thaw.
The test has stopped because the engine out NOx levels could not be modulated to the desired range. Correct the issue, key OFF, allow the ECM to completely power down, key ON, and restart the test.	Another component or feature is taking control of engine speed and preventing the test from modulating NOx to the desired level. • Check that OEM or customer-selected inhibit features are **not** active. • Check that programmable parameters or selected features are correct. Refer to Procedure 019-078 in Section 19 (/qs3/pubsys2/xml/en/procedures/99/99-019-078.html). Also refer to the service bulletin Multiplexing Troubleshooting, Bulletin 4021378 (/qs3/pubsys2/xml/en/bulletin/4021378.html). • Check that the vehicle speed sensor is **not** loose. • Check the vehicle speed sensor for poor grounding or electrical interference.

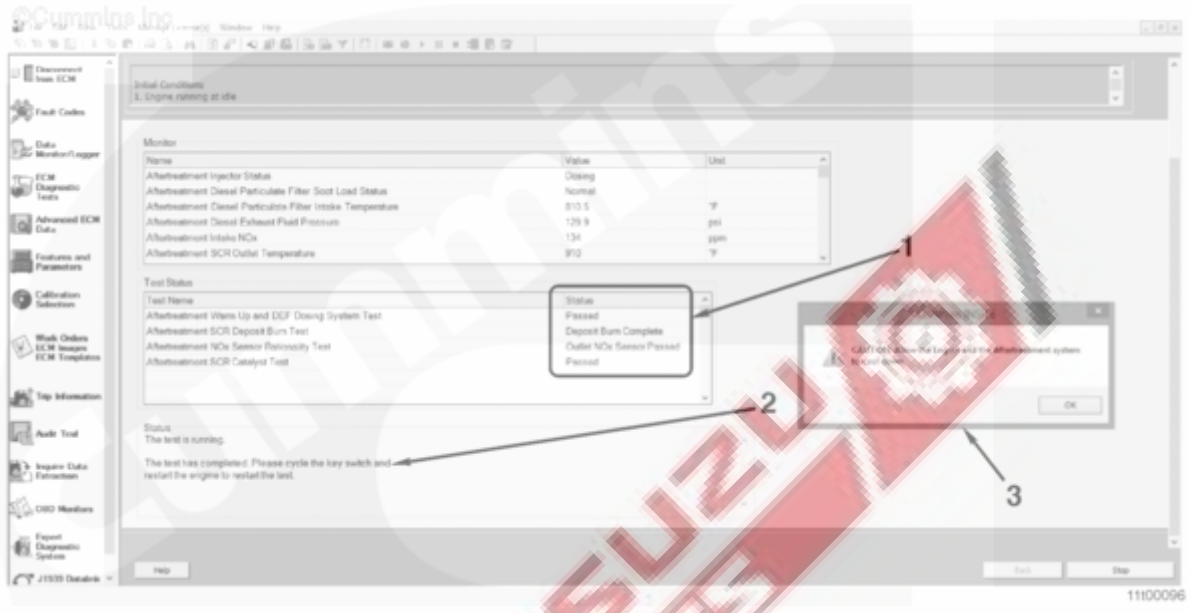
Analyzing the Data

General Information



Aftertreatment SCR System Test Screen (INSITE™ eletronic service tool)

1. Subtest status - all passed
2. Main status window shows test complete
3. Pop-up message appears when test is complete.

Aftertreatment Warm Up and DEF Dosing System Test

Subtest Status Message	Action
Test Not Available	None, this subtest is **not** available for this engine or application.
Stopped, Check Status Window	The test has aborted. Follow instruction from main test status window.
Not Started	None, this portion of the test is **not** currently running.
Warmup in Progress	None
DEF Doser Test Running	None
Passed	None, the test will automatically continue to the next subtest.

Subtest Status Message	Action
Failed	• Check the DEF for proper concentration and for contamination. • Perform the DEF Dosing Unit Override Test. Refer to Procedure 011-063 in Section 11 (/qs3/pubsys2/xml/en/procedures/425/425-011-063.html). If the DEF system passes the Dosing Unit Override Test perform the following: • Inspect the DEF dosing unit intake fitting for debris. Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html) • If debris is found in the intake fitting, replace the fitting and perform the DEF dosing unit airless flush. Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html) Also drain and flush the DEF tank and intake line. See equipment manufacturer service information. • If debris is **not** found in the intake fitting replace the DEF dosing unit. Refer to Procedure 011-058 in Section 11. (/qs3/pubsys2/xml/en/procedures/425/425-011-058.html) Re-run the Aftertreatment SCR System Test once the issue is corrected, to validate the repair.

ANADOLU ISUZU AFTER SALES

Aftertreatment SCR Deposit Burn Test

Subtest Status Message	Action
Test Not Available	None, this subtest is **not** available for this engine or application.
Stopped, Check Status Window	The test has aborted. Follow instruction from main test status window.
Not Started	None, this portion of the test is **not** currently running.
Running	None

Subtest Status Message	Action
Deposit Burn Complete	None
Deposit Burn Failed	None, the test will continue to run. No repair or inspection will be required unless the Aftertreatment NOx Sensor Rationality Subtest fails.

Aftertreatment NOx Sensor Rationality Test

Subtest Status Message	Action
Test Not Available	None, this subtest is **not** available for this engine or application.
Stopped, Check Status Window	The test has aborted. Follow instruction from main test status window.
Not Started	None, this portion of the test is **not** currently running.
Running	None
Outlet NOx Sensor Passed	Both NOx sensors have passed. Test will automatically continue to the next subtest.
Intake NOx Sensor Failed	• Replace the aftertreatment intake NOx sensor. Re-run the Aftertreatment SCR System Test, once the issue is corrected, to validate the repair.
Inspect Outlet NOx Sensor	• Check the decomposition tube for DEF deposits. • Run the DEF System Leak Test. Monitor the DEF dosing valve nozzle for leaks. Refer to Procedure 011-080 in Section 11 (/qs3/pubsys2/xml/en/procedures/425/425-011-080.html). • If no DEF deposits are present and the DEF dosing valve is **not** leaking, replace the outlet NOx sensor. Re-run the Aftertreatment SCR System Test once the issue is corrected, to validate the repair.

ANADOLU ISUZU AFTER SALES

Subtest Status Message	Action
Inspect Both NOx Sensors	• Check the decomposition tube for DEF deposits. • Run the DEF system leak test. Monitor the DEF dosing valve nozzle for leaks. Refer to Procedure 011-080 in Section 11 (/qs3/pubsys2/xml/en/procedures/425/425-011-080.html). • If no DEF deposits are present and the DEF dosing valve is **not** leaking, replace both NOx sensors. Re-run the Aftertreatment SCR System Test once the issue is corrected, to validate the repair.

Aftertreatment SCR Catalyst Test

Subtest Status Message	Action
Not Supported	None, this subtest is **not** supported for this engine or application.
Stopped, Check Status Window	The test has aborted. Follow instruction from main test status window.
Not Started	None, this portion of the test is **not** currently running.
Running	None
Passed	None
Failed	• Replace the aftertreatment SCR catalyst. Re-run the Aftertreatment SCR System Test once the issue is corrected, to validate the repair.

Finishing Steps

- Do **not** turn the keyswitch OFF until the test has completed and the results are displayed.
- Check to make sure the CHECK ENGINE lamp and/or malfunction indicator lamp (MIL) lamp are **not** illuminated.

- Check for any active fault codes. If active fault codes are present, use EDS or Section TF for fault code troubleshooting.
- Use the recommended Cummins® electronic service tool or equivalent to clear all inactive fault codes.

ANADOLU ISUZU AFTER SALES

Select Service Tools

Recommended Cummins® Service Tools

- Clean Care Kit, Part Number 4919073
- Cylinder Diagnostic Kit, Part Number 5394335
- Compression and Leak Down Test Adapter Kit, Part Number 5394350
- Engine barring adapter, Part Number 3824591.

Additional Service Items

- Shop air supply (689 kPa [100 psi] or higher preferred).

General Information

All internal combustion engines require a certain amount of compression to allow ignition of the fuel/air mixture. To make sure of compression, cylinder **must not** have high leakage. High leakage has a negative impact on cylinder and engine performance.

Checking cylinder leakage is a quick way to help determine the mechanical health of a cylinder. This check is most effective when performed as part of a series of symptom-directed diagnostic procedures including (but **not** limited to):

- Crankcase Blowby Check
- Combustion Gas in Coolant Check
- Cylinder Leakage Check
- Chassis & Engine Load Checks.

High leakage can be caused by (but not limited to):

Part	**Possible Root Causes**
Piston Rings	Worn, broken, incorrect, or missing rings
Piston	Cracked piston or hole in piston
Cylinder Bore	Worn or polished bore, crack or hole in bore, out of round, incorrect liner protrusion
Cylinder Head Gasket	Leaking head gasket
Cylinder Head	Cracked head, warped head, bent valves, broken valves, worn or damaged valve seats
Camshaft	Worn camshaft lobes, incorrect part

Part	Possible Root Causes
Valve Train	Damaged rockers, damaged tappets, damaged or bent push rods, damaged valve springs, dropped valve

Evaluating cylinder leakage check results can be done in two ways:

- Cylinder-to-cylinder or engine to engine comparison
- Comparison against a published specification.

See engine specifications in the Engine Testing specifications of Section V for engine-specific leakage values, if available.

A leakage check should be performed on an engine at room temperature (20°C, [68°F]) for best results.

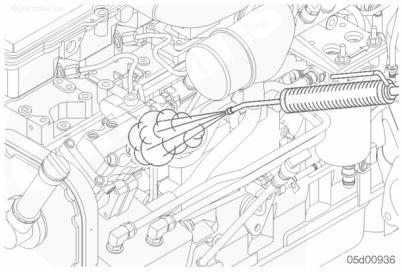
Note : Make sure the overhead is properly set before attempting a leakage check. Improper overhead settings could be the root cause of drivability complaints and could invalidate leakage check results. If settings are not within specification, adjust the overhead and road test. If drivability complaints persist after road test, proceed with the leakage test.

This check will be performed with the engine static.

Preparatory Steps

⚠ WARNING ⚠

Wear safety glasses or a face shield, as well as protective clothing, to prevent personal injury when using a steam cleaner or high-pressure water.



⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

⚠ CAUTION ⚠

Clean all fittings before disassembly. Dirt or contaminants can damage the fuel system.

Before servicing **any** fuel system components, (such as fuel lines, fuel pump, injectors, etc.) which would expose the fuel system or internal engine components to potential contaminants prior to disassembly, clean the fittings,

ANADOLU ISUZU PARTS SALES

mounting hardware, and the area around the component to be removed. Dirt, paint, or other contaminants can be introduced into the fuel system and engine if the surrounding areas are **not** cleaned, resulting in damage to the fuel system and engine.

Remove debris on adjacent chassis frame rails and between the fuel pump heads. Use shop air.

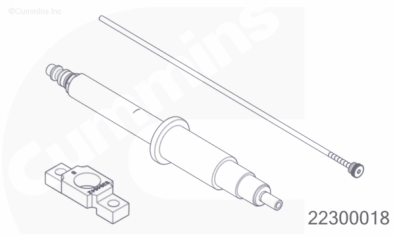
To prevent damage from debris and contamination, cover, cap, or plug any openings as soon as possible when servicing the fuel system. Caps and plugs can be found in Clean Care Kit, Part Number 4919073.

- Relieve the high-pressure fuel from the fuel rail. Refer to Procedure 006-081 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-081.html)
- Remove all fuel injectors. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)

Note : Some diesel engines will require the removal of overhead components to allow removal of the fuel injector.

Setup

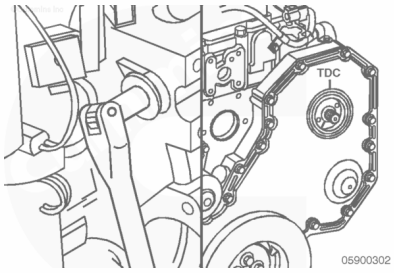
- Install the compression and leak down check adapter into the cylinder being evaluated. These adapters simulate fuel injectors and are retained in the same manner. In most cases, production hardware is reused for the adapter, but some adapters come with their own retaining hardware.
- Remove all liquid from inside the cylinders. Use a vacuum method.



Test

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.



Rotate the crankshaft with the barring tool until the cylinder being evaluated is beginning the compression stroke. Both intake and exhaust valves for the cylinder being evaluated will be fully closed under spring pressure at this point and the rockers of both these valves will have some free clearance (due to overhead lash settings).

Continue rotating the engine until the piston **approaches but does not pass** top dead center (TDC) for the cylinder being evaluated. Some diesel leak down adapters include a TDC indicator gauge. Using the gauge, **stop rotation immediately** when the gauge stops moving upward with crankshaft rotation. On diesel adapters, if the gauge is **not** included with the adapter being used, a slender rod can be used as a substitute. On gas engines, there are no provisions for using a gauge. Approximate TDC is determined using the complimentary cylinder valve overlap method.

For the best results, the piston should **not** be traveling downward when rotation is stopped. If the piston crosses past TDC and starts traveling downward, the piston rings will unseat in the piston ring lands slightly, causing a potential source of measurement error. If the piston starts traveling downward, reverse the barring rotation and rotate the crankshaft until the piston crosses back past TDC in reverse plus 1/3 of a crankshaft rotation. Bar the engine in the normal rotation and try again. Mechanical Diagnostic Kit, Part Number 5395335, includes two leakage testers. See the chart below to make sure the correct one is used.

Note : Use of the incorrect leakage test will generate measurement error.

Leakage Tester Part Number	Bore Size
5394340	Less than 127 mm [5 in]
5394360	Equal to or greater than 127 mm [5 in]

Connect the leakage tester to the compression and leak down check adapter.

Note : Applying air pressure to the test cylinder can cause the engine to attempt to rotate. The engine **must no t** rotate during testing.

Connect shop air to leakage tester. 689 kPa [100 psi] is preferred, but the measurement process will work with lower pressure.

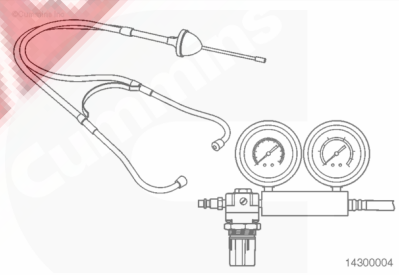
Open the leakage tester pressure regulator. Adjust until the gauge closest to the pressure regulator (reference gauge) reads 100 psi (or maximum available pressure).

Allow the system pressure to stabilize. Record pressure on the gauge farthest from the pressure regulator (cylinder gauge). Record the pressures.

To determine cylinder leakage as a percent, use the following formula: **((Reference Gauge value – Cylinder Gauge value) / Reference Gauge value) x 100 = Cylinder Leakage %**

Repeat test for all remaining cylinders, as necessary.

If one cylinder leakage is higher compared to other cylinders, similar engines, or published specifications, use stethoscope, Part Number 5394338, from Mechanical Diagnostic Kit, Part Number 5394335, to try to determine where the cylinder is leaking when pressurized.



Air Escape Point	Likely Cause of Leakage
Intake Manifold	Intake vale or valve seat, cracked head
Exhaust Manifold or Turbocharger	Exhaust valve or valve seat, cracked head
Coolant System	Cylinder head gasket, cracked head
Engine Crankcase	Piston, piston rings, cylinder bore

Remove the cylinder head. Inspect suspect components further to determine the root cause. See engine-specific procedures.

If all cylinder leakages are uniform compared to each other, but high compared to a similar engine or published specification, the engine can be in need of a full or partial overhaul. Inspect all suspect parts per engine-specific procedures and established reuse guidelines.

Finishing Steps

Note : Bleeding air from the fuel system is an important step. Air in the fuel will make the engine hard to start or not start.

- Remove the compression and leak down check adapter.
- Install the fuel injectors. Refer to Procedure 006-026 in Section 6. (/qs3/pubsys2/xml/en/procedures/425/425-006-026.html)
- Bleed air from the fuel system. See the Prime step in the following procedure. Refer to Procedure 005-234 in Section 5. (/qs3/pubsys2/xml/en/procedures/425/425-005-234-tr.html)
- Operate the engine to check for leaks.

Last Modified: 04-Mar-2020

ANADOLU ISUZU AFTER SALES

General Information

The SAE J1939 Datalink Control Test is used to selectively block datalink control devices while troubleshooting performance issues. Blocking a datalink device removes the restriction enforced by the device on engine speed, power, and torque. The test is located in the recommended Cummins® electronic service tool or equivalent under the diagnostic tests tab.

The SAE J1939 Datalink Control Test has the option to block one to four devices at a time or block all devices at a time.

The SAE J1939 Datalink Control Test can be performed while engine is ON and can be stopped at any time.

The SAE J1939 Datalink Control Test will display the status of each of the devices in the status window. Reference Figure 1 below.

Note : It is not recommended to drive the vehicle while performing the J1939 Datalink Control Test unless directed by published troubleshooting.

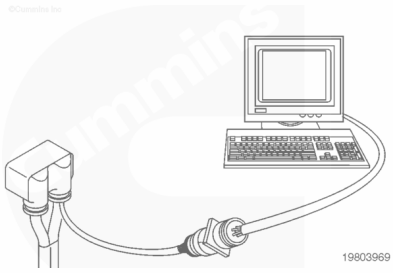
Figure 1, SAE J1939 Datalink Control Test

1. Test Instructions Window
2. Test Status Window
3. Supported Devices Window.

System Requirements

The SAE J1939 Datalink Control Test requires:

- Personal computer with Windows™ 7, or later, software.
- Recommended Cummins® electronic service tool or equivalent.



Preparatory Steps

Connect recommended Cummins® electronic service tool or equivalent and check for active fault codes. Troubleshoot any active fault codes prior to performing this test.

Do **not** perform the SAE J1939 Datalink Control Test unless guided to do so by a service procedure and/or published troubleshooting.

Test

To perform the SAE J1939 Datalink Control Test, complete the steps listed below:

- 1. Begin the SAE J1939 Datalink Control Test.
  - Use recommended Cummins® electronic service tool or equivalent to initiate the SAE J1939 Datalink Control Test.
  - Follow the on-screen instructions.
  - Once the faulty device has been detected, the test may be stopped.

Note : If the connection between recommended Cummins® electronic service tool or equivalent and the engine control module (ECM) is lost for any reason, a pop-up message will appear. When this occurs, the test will automatically abort. The test can be restarted after cycling the keyswitch OFF for 90 seconds and then back ON.

- 2. Monitor the area.
  - Make sure that the vehicle and surrounding area are monitored during the SAE J1939 Datalink Control Test. If any unsafe condition occurs, stop the test immediately.
  - Turn the keyswitch to the OFF position.

Turning the key to the OFF position will cause the test to stop.

Test progress can be monitored using the Test Status window.

Test results will be displayed as each device’s ECM status is changed.

ARABOLU ISUZU SPARE SALES

Note : If the connection between recommended Cummins® electronic service tool or equivalent and the engine control module (ECM) is lost for any reason, a pop-up message will appear. When this occurs, the test will automatically abort. The test can be restarted after cycling the keyswitch OFF for 90 seconds and then back ON.

The SAE J1939 Datalink Control Test will **not** start or will be aborted if:

- Another diagnostic test is running.
- Battery voltage is low.

If the SAE J1939 Datalink Control Test aborts or will **not** activate, a message will be displayed. Correct the issue identified before proceeding. For more information on abort messages and associated repair actions, reference the Troubleshooting section of this procedure.

Finishing Steps

- Turn the keyswitch to the OFF position for 90 seconds.
- Do **not** turn the keyswitch OFF until the test has completed and the results are displayed.

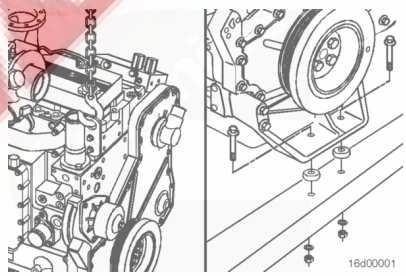
Remove

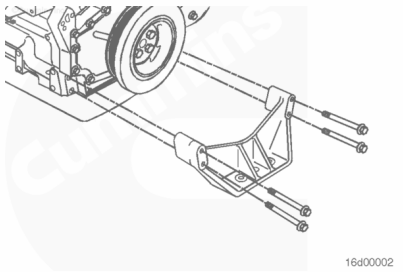
Note : Make sure to save any shims or spacers removed and record their location.

Use a hoist or lifting fixture to support the front of the engine.

Remove the capscrews from the front engine mount.



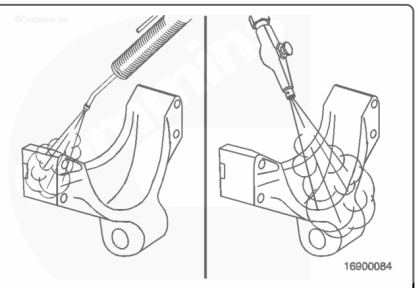
Remove the four mounting capscrews and front engine support.



Clean and Inspect for Reuse

⚠ WARNING ⚠

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



ANADOLU ISUZU AFTER SALES

⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

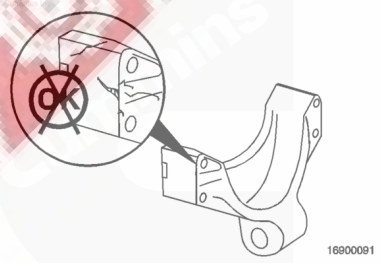
⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

Clean the front engine support. Use steam or solvent. Dry with compressed air.

Inspect the support for cracks or other damage.

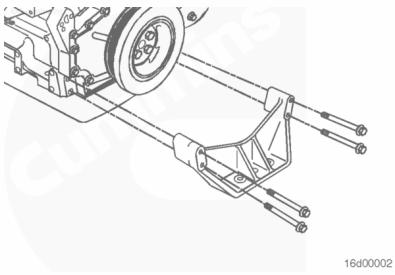
If the support is cracked or otherwise damaged, it **must** be replaced.



Install

Install the front support and mounting capscrews.

Torque Value: 112 n•m [83 ft-lb]



Note : Make sure to install any shims or spacers in the same location as removed.

Lower the front of the engine.

Install the front engine mount capscrews.

Tighten the capscrews to manufacturer specifications.

Remove the lifting fixture or hoist from the front of the engine.

Recommended Cummins® Service Tools

- No Cummins® Service Tools required.

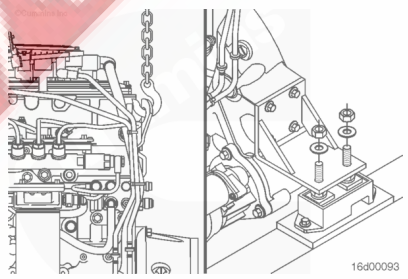
Additional Service Items

- Hoist or lifting fixture

Remove

⚠ WARNING ⚠

The engine lifting equipment must be designed to lift the engine and transmission as an assembly without causing personal injury.

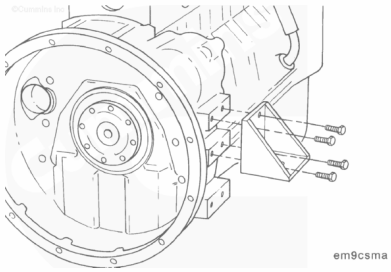


Note : Make sure to install any shims or spacers in the same location as removed.

Use a hoist or lifting fixture to support the rear of the engine.

Remove the capscrew from the rear engine mount.

Remove the four capscrews and rear support bracket.

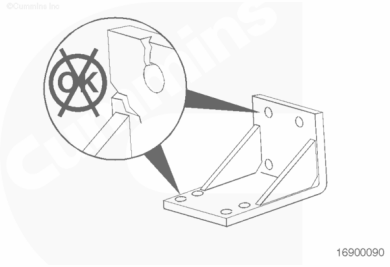


Clean and Inspect for Reuse

⚠ WARNING ⚠

ANADOLU ISUZU AFTER SALES

When using solvents, acids, or alkaline materials for cleaning, follow the manufacturer's recommendations for use. Wear goggles and protective clothing to reduce the possibility of personal injury.



⚠ WARNING ⚠

When using a steam cleaner, wear safety glasses or a face shield, as well as protective clothing. Hot steam can cause serious personal injury.

⚠ WARNING ⚠

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

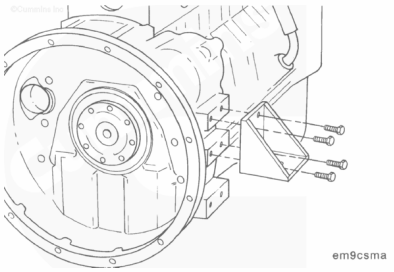
Clean the rear engine support. Use solvent or steam. Dry with compressed air.

Inspect the support bracket for cracks or damage. If the support bracket is cracked, it **must** be replaced.

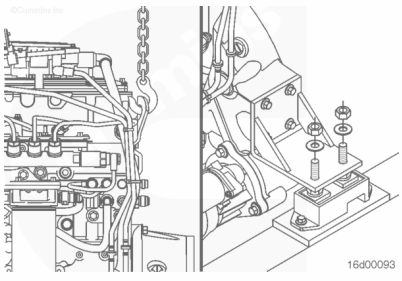
Install

Install the support bracket and mounting capscrews.

Torque Value: 71 n•m [52 ft-lb]



Note : Make sure to install any shims or spacers in the same location as removed.



Lower the rear of the engine.

Install the rear engine mount capscrews.

Tighten to the manufacturer's specifications.

Remove the lifting fixture or hoist from the rear of the engine.

Preparatory Steps

⚠ WARNING ⚠

Batteries can emit explosive gases. To reduce the possibility of personal injury, always ventilate the compartment before servicing the batteries. To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

⚠ WARNING ⚠

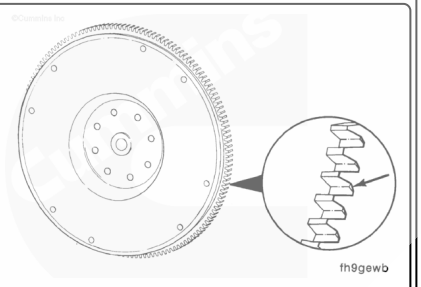
This component or assembly weighs greater than 23 kg [50 lb]. To prevent serious personal injury, be sure to have assistance or use appropriate lifting equipment to lift this component or assembly.

- Disconnect the batteries. See equipment manufacturer service information.
- Remove the transmission and related components. See equipment manufacturer service information.

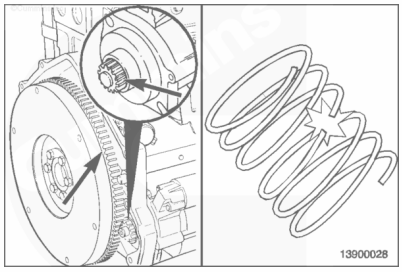
Initial Check

Inspect the flexplate ring gear teeth for damage.

If the flexplate ring gear is damaged, make sure to evaluate the following possible causes prior to replacing the flexplate.



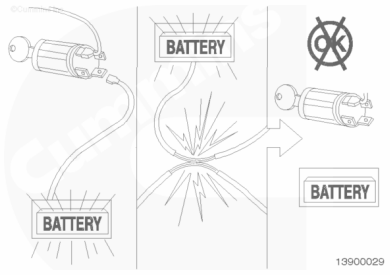
Mechanical



A mechanical issue can typically be identified by seeing damage to the ring gear of the flexplate in three distinct locations for 6 cylinder engines (commonly called 120 degree milling), and two locations for 4 cylinder engines (commonly called 180 degree milling). The following can be causes for mechanical issues:

1. The possibility of improper starter motor spacing. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
2. The interference between the ring gear land area and starting motor pinion. The wrong starting motor might be installed, seee original equipment manufacturer (OEM) specifications.
3. The possibility of a damaged starter motor pinion. Inspect the pinion for nicks and burrs. If replacement of the starting motor is necessary. Refer to Procedure 013-020 in Section 13. (/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)
4. The torque converter/transmission is damaged or incorrectly mounted. See equipment manufacturer service information.
5. Incorrect starting motor pinion to flexplate ring gear pitch and teeth match. See equipment manufacturer service information.

Electrical



An electrical issue can typically be identified by seeing damage to the ring gear of the flexplate 360 degrees around the circumference of the ring gear (commonly called 360 degree milling). The following can be causes for electrical issues:

1. The operator is attempting to start engine while engine is already running. Check if a starter lockout feature is available through the OEM (activated with INSITE™ electronic service tool) or starting motor manufacturer.
2. The keyswitch is causing intermittent starting motor engagement when the engine is running. Inspect the key switch. Refer to Procedure 013-020 in Section 13.

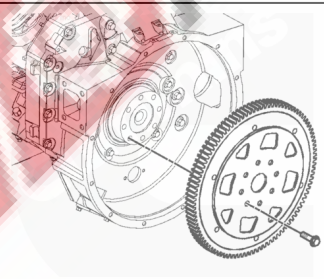
(/qs3/pubsys2/xml/en/procedures/425/425-013-020-tr.html)

3. The orientation of the starter relay, where in the direction of the pull contact is in the direction of vehicle travel. This results in intermittent starter motor engagement when the engine is running. Relocate the starter relay. See equipment manufacturer service information.
4. Intermittent starter motor wiring issues. See equipment manufacturer service information.

Remove

Note : Some flexplates require mounting plates and/or adapters. It can be necessary to remove any mounting plates and/or adapters prior to or with the flexplate. Make sure to note the location of any mounting plates and/or adapters for later installation.

Remove the flexplate capscrews and flexplate.

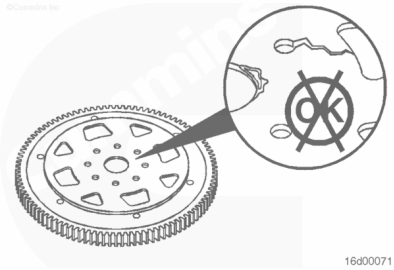


Inspect for Reuse

Inspect the teeth of the ring gear for chips or uneven wear.

Check the flexplate for cracks.

Replace the flexplate if any damage is found.



Install

Note : Some flexplates require mounting plates and/or clamp rings. It can be necessary to install any mounting plates and/or clamp rings prior to or with the flexplate as noted during removal.

Install the flexplate and flexplate capscrews. Tighten.
